

CAUTION

To reduce the chance of personal injury and/or property damage, the following instructions must be carefully observed:

Proper service and repair are important to the safety of the service technician and the safe, reliable operation of all motor vehicles. If part replacement is necessary, the part must be replaced with one of the same part number or with an equivalent part. Do not use a replacement part of lesser quality.

The service procedures recommended and described in this service manual are effective methods of performing service and repair. Some of these procedures require the use of tools specifically designed for the purpose.

Accordingly, anyone who intends to use a replacement part, service procedure or tool, which is not recommended by the vehicle manufacturer, must first determine that neither their safety nor the safe operation of the vehicle will be jeopardized by the replacement part, service procedure or tool selected.

It is important to note that this manual contains various "Cautions" and "Notices" that must be carefully observed in order to reduce the risk of personal injury during service or repair, or the possibility that improper service or repair may damage the vehicle or render it unsafe. It is also important to understand that these "Cautions" and "Notices" are not exhaustive, because it is impossible to warn of all the possible hazardous consequences that might result from failure to follow these instructions.

This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE," and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

To help avoid accidental air bag deployment and personal injury, when servicing a vehicle that requires repair of the SIR system and another vehicle system, it is recommended that the SIR system be repaired first using service manual procedures.

CAUTION: General Motors service manuals are intended for use by professional, qualified technicians. Attempting repairs or service without the appropriate training, tools, and equipment could cause injury to you or others and damage to your vehicle that may cause it not to operate properly.

1996 CHEVROLET CAPRICE, IMPALA SS AND BUICK ROADMASTER SERVICE MANUAL

BOOK 1

FOREWORD

This manual provides information on diagnosis, service procedures, adjustments, and specifications for the 1996 Chevrolet Caprice, Impala SS and Buick Roadmaster.

An understanding of the material contained in this manual and in the appropriate Dealer Service Bulletins will help technicians to better service vehicle owners.

The 1996 Caprice, Impala SS, and Roadmaster service manual has been separated into two books:

BOOK 1

Contains all sections EXCEPT Driveability and Emissions (Sections 6E and 6E3), and Electrical Diagnosis (Section 8A).

BOOK 2

Contains Driveability and Emissions (Sections 6E and 6E3), Automatic Transmission Diagnosis (7A-14A), and Electrical Diagnosis (Section 8A).

1996 Transmission/Transaxle/Transfer Case Unit Repair Manual - Contains unit repair information for all automatic and manual transmissions and transaxles, and transfer cases. Also contained within the automatic transmission and transaxle information is the fluid flow and circuit description information.

When reference is made in this manual to a brand name, number, or specific tool, an equivalent product may be used in place of the recommended item.

All information, illustrations, and specifications contained in this manual are based on the latest product information available at the time of publication. The right is reserved to make changes at any time without notice.

GENERAL MOTORS SERVICE MANUAL COMMENTS

If you find an error, omission, or have a suggestion on any General Motors Service Manual, we want to hear from you.

United States and Canada - (General Motors Dealer Employees Only)

1-800-828-6860

(Monday - Thursday 8:00 AM to 8:00 PM EST)

(Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

Canada French Speaking - (General Motors Dealer Employees Only)

1-800-503-3222

(Monday - Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

International English Speaking - (General Motors Dealer Employees Only)

810-265-0840

(Monday - Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

These phone numbers can be called Monday through Friday. Be prepared to give the following information:

- Your name
- Your dealership's name

- Your phone number
- Model year and vehicle line
- Publication part number (if present)
- Vehicle Identification Number of vehicle being worked on.
- Section and page number(s)
- Description of problem

This phone number cannot provide technical assistance. Contact your regular technical assistance source.

The personnel answering this phone number will provide the author of the information with your comments and will follow-up until an answer is given.

If you wish to send examples or marked-up pages, the person who takes your call will tell you how to do that.

United States and Canadian Vehicle Owner/Operator

If you are the owner or operator of the vehicle, please give your comments to the applicable Customer Assistance Center. The phone number and address are in your Owner's Manual.

SECTION 0A

GENERAL INFORMATION

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under On-Vehicle Service and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) HANDLING

Refer to CAUTIONS and the SIR Component and Wiring Location view in SECTION 9J when performing service on or around SIR components or SIR wiring. SIR equipped vehicles can be identified by:

- Steering wheel hub marked “INFLATABLE RESTRAINT.”
- “INFLATABLE RESTRAINT” indicator lamp in instrument cluster.
- Code “2” for the seventh digit of the vehicle identification number (VIN).

DISCONNECTING THE BATTERY NEGATIVE CABLE

CAUTION: Before removing or installing any electrical unit or when a tool or equipment could easily come in contact with “live” exposed electrical terminals, disconnect the battery negative cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the “OFF” or “LOCK” position.

HANDLING ELECTROSTATIC DISCHARGE (ESD) SENSITIVE PARTS

Figure 1

NOTICE: When handling an electronic part that has an ESD sensitive label (Figure 1) or is identified as ESD sensitive in the list that follows, the service technician should follow these guidelines to reduce any possible electrostatic charge buildup on the service technician’s body and the electronic part in the dealership:

1. Do not open package until it is time to install the part.
2. Do not touch electrical terminals of the part or its pigtail connector(s) with a finger or tool.
3. Before removing the part from its package, ground the package to a known good ground on the vehicle.
4. Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across the seat, sitting down from a standing position or walking a distance.

0A-2 GENERAL INFORMATION

Not all parts that can be damaged by ESD have an ESD label. Components that can be damaged by ESD are:

- Chime module
- Cruise control module
- SIR Sensing and Diagnostic Module (SDM)
- Powertrain Control Module (ECM)
- Automatic day/night mirror
- Radio
- Antilock Brake System Electronic Control Module (EBTCM)
- Automatic air conditioning control assembly
- Twilight sentinel amplifier

Solid state components also can be damaged if they are bumped or dropped, or if they are laid on a metal work bench or on an electrically operated item such as a radio, a TV or an oscilloscope.

SPECIAL TOOL ORDERING INFORMATION

Special service tools that are shown in this service manual that have tool product numbers beginning with "J" are available for worldwide distribution from:

Kent-Moore
SPX Corporation
29784 Little Mack
Roseville, MI 48066-2298
1-800-345-2233

Monday through Friday
8:00 a.m. through 8:00 p.m. EST
Telex: 244040 KMTR VR
Fax: 810-578-7375

General Motors dealers and non General Motors repair facilities can purchase scan tools and accessories through Kent-Moore at the above address and phone number.

BODY IDENTIFICATION

Paint codes, trim numbers, seat option codes, and other body information are included on the Service Parts Identification Label. Refer to "Service Parts Identification Label" in this section.

FEDERAL VEHICLE THEFT PREVENTION STANDARD

Federal law requires General Motors to place a Vehicle Identification Number (VIN) label on certain parts of selected vehicles. The purpose of the standard is to reduce motor vehicle thefts by making parts removed from stolen vehicles easier to trace and

Figure 1 - ESD Sensitive Parts Label

recover. The label is permanently attached to an interior surface of the part and displays the complete VIN. The label on a replacement part contains the letter "R," the manufacturer's logo and the symbol "DOT."

Important

- THESE LABELS ARE NOT TO BE DEFACED, REMOVED OR COVERED. The labels must be shielded from paint, rust proofing and undercoating (dealer preparation included).

VEHICLE IDENTIFICATION NUMBER

Figure 2

The Vehicle Identification Number (VIN) legally identifies the vehicle. A VIN plate is attached to the upper left of the instrument panel and can be seen from outside the vehicle. A bar code VIN is also on the vehicle identification plate. Each sequential unit number is prefixed by letters and numbers that are explained in the following chart. The VIN also appears on the Vehicle Certificate of Title and Registration. A derivative of the VIN is stamped on the engine and transmission. The code gives the model year, plant of manufacture and a sequence number that also indicates the car division. A VIN number is also stamped on the frame.

VEHICLE IDENTIFICATION NUMBER

Each vehicle carries a 17 digit Vehicle Identification Number used for license and insurance identification and in general reference to the automobile. The number is located on a plate riveted to the windshield lower frame at the driver's side of the car where it is visible through the windshield. The Vehicle Identification number is decoded as follows:

C10029

ENGINE CODE	DISPLACEMENT		BORE AND STROKE		FUEL SYSTEM	NET HORSEPOWER/TORQUE	COMPRESSION RATIO
	CU. IN.	LITERS	mm	INCHES			
W (L99)	265	4.3	94.89X76.20	3.736X3.00	Multiport Fuel Injection	200 HP@5000 RPM 235 lb. ft. @ 2400 RPM	9.9:1
P (LT1)	350	5.7	101.6X88.4	4.00X3.48	Multiport Fuel Injection	w/o Trailer Tow 260 HP @ 5000 RPM 330 lb. ft. @ 2400 RPM	10.0:1
						w/Trailer Tow 250 HP @ 5000 RPM 310 lb. ft. @ 2400 RPM	

T5742

MODEL IDENTIFICATION

Models (series) and body styles for the current year are listed in the previous chart.

ENGINE IDENTIFICATION

Figure 4

The L99 4.3 liter V8 (VIN W) engine is standard for the Chevrolet sedan. The LT1 5.7 liter V8 (VIN P) engine is optional for the Chevrolet sedan and standard for the Chevrolet wagon, Impala SS and Buick. The VIN code (refer to chart) provides detailed

engine information by the engine code letter located on the vehicle identification plate. Stick-on-labels attached to the engine indicate the engine unit number and code. These labels also contain bar codes for in-plant identification. Engines are stamped with an engine identification number which identifies the assembly plant, the month produced, the day produced and the engine type code. All engines and transmissions are stamped with a VIN derivative, created from the complete VIN. Refer to "Vehicle Identification Number" in this section.

The stamping contains nine positions. Position 1 is the GM car division identifier. Position 2 is the model year code. Position 3 is the car assembly plant

0A-4 GENERAL INFORMATION

Figure 2 - VIN Plate Location

code. Positions 4 through 9 contain the assembly plant sequential number of the vehicle (Figure 3). If the engine in the vehicle is the original engine, information can be derived from the eighth VIN position letter or number (refer to previous chart). To determine if the engine is original, compare the VIN and the VIN derivative. The VIN derivative should be the same as positions 3 and 10 through 17 of the VIN.

TRANSMISSION USAGE

Figure 5

One transmission is available. It is the HYDRA-MATIC 4L60-E automatic overdrive transmission with 4 forward gear ranges and a reverse gear range. The transmission usage chart lists the different application codes available.

Figure 3 - VIN Derivative

TRANSMISSION IDENTIFICATION

Figure 5

The transmission has two identifying stampings: the transmission identification and the VIN derivative. The transmission identification number gives the transmission model, when it was made, and the application code. The transmission identification number is stamped on the automatic transmission case (Figure 5). The VIN derivative is created from the complete VIN and is stamped in either of 2 places. Refer to "Vehicle Identification Number" in this section.

Figure 4 - Engine Identification Locations

GENERAL VEHICLE LIFTING AND JACKING

Figures 6 and 7

CAUTION: To help avoid personal injury when a vehicle is on a hoist, provide additional support for the vehicle at the opposite end from which components are being removed. The additional support will reduce the possibility of the vehicle's falling off the hoist. When removing major components of the vehicle while the vehicle is on a hoist, the vehicle frame should be chained to the hoist pads at the same end as the removed components to prevent tip-off. Failure to follow these precautionary measures could result in vehicle damage, serious personal injury or death.

NOTICE: When jacking or lifting a vehicle at the frame side rails or other prescribed lift points, be certain that lift pads do not contact the catalytic converter, brake pipes or fuel lines. Such contact may result in damage or unsatisfactory vehicle performance.

When a vehicle is lifted with a vehicle jack or floor jack, the wheels at the opposite end should be blocked. Jackstands should be used to provide additional support. Jackstands should be placed under either the frame, the front suspension crossmember or the rear axle.

The vehicle should be on a clean, hard, level surface before any lifting procedure begins. All lifting equipment must meet weight standards and be in good working order. Make sure all vehicle loads are equally distributed and secure. If the only support for the vehicle is at the frame side rails, make sure the lifting equipment does not put too much stress on or weaken the frame side rails.

Recommended vehicle lifting points are shown in Figures 6 and 7. If any other hoist methods are used, take special care not to damage the fuel tank, filler neck, exhaust system or underbody.

LOCK CYLINDER CODING

Key Identification and Usage

Figure 8

The lock cylinder keyway is designed so that other model keys will not enter a current model lock cylinder. Two non-interchangeable keys are used.

- Square-headed key is used in the ignition lock cylinder.
- Oval-headed key is used in all other lock cylinders.

Key identification is obtained from the four-character key code stamped on the knockout portion of the key head and from an identification letter stamped on the key shank. After the code number has been recorded by the owner, the plugs should be knocked out of the key head. Using these numbers, owners of key-cutting equipment can determine the lock combination by consulting a code

0A-8 GENERAL INFORMATION

list available from equipment suppliers. If the key code numbers are not available from records or from the knockout plug, the lock combination (tumbler numbers and position) can be determined by laying the key on the diagram (Figure 8).

Cutting Keys

Figure 8

1. Determine correct PASS-Key II® code if cutting key for ignition cylinder. Refer to SECTION 9D.
2. Determine special code from the code list or key code diagram (Figure 8).
3. Cut a blank key with the correct PASS-Key II® code to proper level for each of six tumbler positions or according to directions supplied by the key-cutting equipment manufacturer.
4. Check key operation in lock cylinder.
 - If ignition key was cut and vehicle starts with original key but will not start with new key, PASS-Key II® code is incorrect. Refer to SECTION 9D.

Replacement Lock Cylinders

Figure 9

Lock cylinders (3) are available from service parts warehouses completely coded and with a new key. The new lock cylinder (3) has a locking bar staked in place. Tumblers (1) and springs are also available and must be assembled into the lock cylinder (3) according to the key code.

Assembling and Coding Lock Cylinders

ALL LOCK CYLINDERS EXCEPT INSTRUMENT PANEL COMPARTMENT

Figures 8 through 11

Tumblers (1) for all locks are shaped exactly alike, with the exception of the notch position on one side. As the key is inserted in the lock cylinder (3), tumblers (1) are lowered to the correct height so that notches on each tumbler (1) are at the same level. When the notches on all six tumblers line up, the side bar (4) is pushed into the notches by two small springs. This allows the lock cylinder (3) to turn in its bore. Five types of tumblers (1) are used to make the various lock combinations. Each tumbler (1) is coded

Figure 8 - Key Code Diagram

according to a number, one through five, stamped on its side.

Assemble

1. Determine tumbler numbers and arrangement.
 - With the numerical key code, use code list provided by the key cutting equipment supplier.
 - Without the numerical key code or without the code list, refer to Figure 8.
 - A. Lay key on the key code diagram. Be sure key is outlined by the diagram.
 - B. Start with position number one. Find and record the lowest level (tumbler number) that is visible. Repeat for each of the remaining five positions.
2. Tumblers (1) in their proper slots in the order called for by the code (Figure 8).
 - Start with position number one, nearest open end or lock cylinder head (2).
3. Tumblers (1) by pulling side bar (4) out with fingers.
4. One tumbler spring (6) above each tumbler (1).
5. Spring retainer (5) so that end prongs slide into slots at each end of lock cylinder (3).
 - Press spring retainer (5) down (Figure 10).
6. Insert key into lock cylinder (3) to check for proper installation.
 - Side bar (4) will drop down if tumblers (1) are installed properly. If incorrectly assembled, take apart and assemble correctly.

Figure 9 - Lock Cylinder Components

Figure 10 - Installing Spring Retainer

NOTICE: Use leather or wood at each vise jaw to prevent damage to the cylinder.

7. Remove key and secure lock cylinder (3) in a vise with spring retainer (5) exposed.
 - A. Stake spring retainer (5) securely in place at each end. Use a suitable staking tool and stake cylinder metal over the spring retainer (5).
 - B. Black lock cylinders should be lubricated with Multi-Purpose Lubricant (GM P/N 12345120 or equivalent) or light machine oil. All other lock cylinders should be lubricated with a general purpose silicone lubricant.

INSTRUMENT PANEL COMPARTMENT LOCK CYLINDER

Figures 11 and 12

A lock cylinder with snap-in tumblers (1) is used for the instrument panel compartment lock. The lock cylinder has four or five tumbler positions. The number one or two position (closest to the lock cylinder head (2)) is a brass retainer tumbler. The two through five positions or three through five positions are standard tumbler positions depending upon cylinder type. Therefore, only the last four or five tumbler combinations are required.

Figure 11 - Installing Tumblers

Assemble

1. Determine tumbler numbers and arrangement as previously described and install tumblers (1).
2. After installation, tap tumblers (1) flush with the cylinder.

METRIC FASTENERS

Figure 13

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Figure 12 - Locking Tumblers in Place

CUSTOMARY		METRIC	
1/4	— 20	M6.0	X 1
THREAD MAJOR DIAMETER IN INCHES	NUMBER OF THREADS PER INCH	THREAD MAJOR DIAMETER IN MILLIMETERS	DISTANCE BETWEEN THREADS IN MILLIMETERS
THREAD PITCH			

6-19-94
BS0150A

Figure 13 - Thread Notation

0A-10 GENERAL INFORMATION

- Some bolts are designed to permanently stretch, and if a stronger fastener is used, the part will not be tightened correctly. These permanently stretching bolts will be called out. The correct part number fasteners must be used to replace this type of fastener because there is no available equivalent.
- Other bolts are designed to break if over tightened to prevent part damage. If a stronger fastener is used part damage may occur.

Fasteners that need to be replaced when removed will be called out. Fasteners that require thread lockers or thread sealant will be called out. The correct tightening specification and sequence must be used when installing fasteners. Part or system damage may occur if the above instructions are not followed.

Most fasteners used on this vehicle are metric. Metric fasteners may be close in dimension to well-known customary fasteners in the inch system. Replacement fasteners must be the correct nominal diameter, thread pitch and strength.

Original equipment metric fasteners, except for exposed bumper bolts, beauty bolts, or other specialty bolts have numbers on their heads that identify them as metric. Cross-recess head screws can be identified by a Posidriv® or a Type 1A cross-recess. Either type of cross-recess screwdriver can be used to remove Posidriv® recess head screws, but Type 1A will perform better.

NOTICE: Most metric fasteners have a blue or green color coating. This coating should not be used to positively identify fasteners because not all metric fasteners are color-coated. Damage to the fastener or part could result if a customary fastener is incorrectly used to replace a metric fastener. Metric and customary thread notations differ slightly. For example, the thread major diameter of a 1/4-20 bolt/screw is 1/4 inch, and the bolt/screw has 20 threads per inch. The thread major diameter of an M6.0x1 bolt/screw is 6.0 mm, and the bolt/screw has 1 mm between threads.

FASTENER STRENGTH IDENTIFICATION

Figure 14

Most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt/screw. Customary fastener strength property classes range from grade 2 to 8. Radial lines are embossed on the head of each bolt/screw to identify the strength class. Some metric nuts are marked with strength identification numbers on the nut face (Figure 14). When replacing fasteners, be careful to use bolts/screws and nuts of a strength class equal to the original fasteners (the same number marking).

Figure 14 - Fastener Strength Markings

Also select replacement fasteners of the correct size. Correct replacement bolts/screws and nuts are available through General Motors Service Parts Operation (GMSPO).

Many metric fasteners available in the aftermarket parts channels were designed to metric standards of countries other than the United States. The fasteners may have different strength or thread pitch and may not have the numbered head marking system. The metric fasteners used on GM products are designed to new international standards that might not be used by some nondomestic bolt/screw and nut suppliers.

PREVAILING TORQUE FASTENERS

Figures 15 and 16

A prevailing torque nut is designed to develop an interference between the nut and bolt/screw threads. This interference is usually created by distortion of the top of an all-metal nut or by a nylon patch in the threads in the middle of a hex flat. In other cases, a nylon insert may be used (Figure 15).

A prevailing torque bolt/screw is designed to develop an interference between the bolt/screw and nut threads or between the bolt/screw and tapped hole threads. This interference is created by distorting some of the threads or by using a nylon patch or adhesive (Figure 15).

Rusty or damaged bolts/screws and nuts should be replaced with new parts of the same strength class. Clean, unrusted bolts/screws and nuts can be reused. Be sure to use the following recommendations:

1. Clean dirt and other foreign material from nut or bolt/screw.
2. Inspect nut or bolt/screw for cracks, elongation or other signs of abuse or overtightening.
 - If nut or bolt/screw is worn in any way, replace with a nut or bolt/screw of the same strength class.
3. Assemble the parts and hand-start nut or bolt/screw.

Figure 15 - Prevailing Torque Nuts and Bolts/Screws

4. Check that nut or bolt/screw develops the proper torque before it seats (Figure 16).
 - If nut or bolt/screw fails to develop torque correctly, replace with a nut or bolt/screw of the same strength class.
5. Tighten fastener to the torque specified in the appropriate installation procedure in this manual.

ENGLISH-SI METRIC CONVERSIONS

To convert english units to metric units, multiply the english units by the conversion factor shown in the conversion chart. To convert metric units to english units, divide the metric units by the conversion factor shown in the conversion chart.

DECIMAL AND METRIC EQUIVALENTS

Inch-to-millimeter decimal equivalents are shown in the decimal equivalent chart.

FASTENER TYPE	TORQUE UNITS	METRIC – SIZE FASTENERS							
		6	6.3	8	10	12	14	16	20

0A-12 GENERAL INFORMATION

STANDARD NOMENCLATURE FOR ELECTRICAL/ELECTRONIC COMPONENTS AND SYSTEMS

Figures 17 and 18

General Motors will be complying with the Society of Automotive Engineers (SAE) Recommended Practice J 1930. J 1930, an industry-wide standard that was adopted into government regulations, requires identical

nomenclature for certain electrical/electronic components and systems that have the same function. The standard is also being applied to abbreviations and acronyms and is being used in all 1995 GM service publications.

To make this standard work, some names and abbreviations are being replaced with those recommended by the SAE Standard. Figures 17 and 18 are a listing of former GM names and abbreviations beside the new J 1930 name and abbreviations.

Former GM Name	New SAE Name Term
Absolute Pressure Sensor Aps – APS	Manifold Absolute Pressure Sensor – MAP Sensor
Air Cleaner Assembly	Air Cleaner – ACL
Air Cleaner Filter Element	Air Cleaner Filter – ACL Filter
Air Injection Reaction System – A.I.R. System	Secondary Air Injection System – AIR System
Assembly Line Communication Link – ALCL	Data Link Connector – DLC
Assembly Line Data Link – ALDL	Data Link Connector – DLC
Barometric Pressure Sensor – BARO Sensor	Barometric Pressure Sensor – BARO Sensor
BCM-PCM Data Problem	BCM-PCM Data Link
Calibration Pack – CAL-PAK	Electronically Erasable Programmable Read Only Memory – EEPROM
Calibration Pack – CAL-PAK	Erasable Programmable Read Only Memory – EPROM
Calibration Pack – CAL-PAK	Programmable Read Only Memory – PROM
Camshaft Sensor	Camshaft Position Sensor – CMP Sensor
Canister Purge – CP	Evaporator Emission Canister Purge – EVAP Canister Purge
Catalytic Converter – Cat. Conv.	Oxidation Catalytic Converter – OC
Catalytic Converter – Cat. Conv.	Three Way + Oxidation Catalytic Converter – TWC + OC
Catalytic Converter – Cat. Conv.	Three Way Catalytic Converter – TWC
Catalytic Converter – Cat. Conv.	Warm Up Oxidation Catalytic Converter – WU-OC
Catalytic Converter – Cat. Conv.	Warm Up Three Way Catalytic Converter – WU-TWC
Check Engine Indicator	Malfunction Indicator Lamp – MIL
Code	Diagnostic Trouble Code – DTC
Computer Command Control – CCC	Engine Control Module – ECM
Computer Controlled Coil Ignition – C3I	Electronic Ignition – EI
Controlled Canister Purge – CCP	Evaporative Emission Canister Purge – EVAP Canister Purge
Coolant Temperature Sensor – CTS	Engine Coolant Temperature Sensor – ECT Sensor
Coolant Temperature Switch – CTS	Engine Coolant Temperature Switch – ECT Switch
Detonation Sensor	Knock Sensor – KS
Diagnostic Circuit Check	On-Board Diagnostic System Check – OBD System Check
Digital Electronic Fuel Injection – DEFI	Multiport Fuel Injection – MFI
Digital Electronic Fuel Injection – DEFI	Sequential Multiport Fuel Injection – SFI
Digital Fuel Injection – DFI	Multiport Fuel Injection – MFI
Digital Fuel Injection – DFI	Sequential Multiport Fuel Injection – SFI
Direct Ignition System – DIS	Electronic Ignition System – EI System
Distributor HEI Module	Distributor Ignition Control Module – DI Control Module
Distributorless Ignition System – DIS	Electronic Ignition System – EI System
Dual Bed Monolith – DBM	Oxidation Catalytic Converter – OC
Dual Bed Monolith – DBM	Three Way Catalytic Converter – TWC
Electronic Air Control – EAC	Secondary Air Injection Bypass Valve – AIR Bypass Valve
Electronic Air Switching – EAS	Secondary Air Injection Switching Valve – AIR Switching Valve
Electronic Control Module – ECM	Powertrain Control Module – PCM
Electronic Fuel Injection – EFI	Multiport Fuel Injection – MFI
Electronic Fuel Injection – EFI	Sequential Multiport Fuel Injection – SFI
Electronic Fuel Injection – EFI	Throttle Body Fuel Injection – TBI
Electronic Spark Control Circuit – ESC Circuit	Knock Sensor Circuit – KS Circuit
Electronic Spark Control System – ESC System	Knock Sensor System – KS System

01-26-95
F80220A

Figure 17 - Standard Nomenclature for Electrical/Electronic Components and Systems (1 of 2)

0A-14 GENERAL INFORMATION

Former GM Name	New SAE Name Term
Electronic Spark Timing – EST	Ignition Control – IC
Electronic Spark Timing Circuit – EST Circuit	Ignition Control Circuit – IC Circuit
Electronic Vacuum Regulator Valve – EVRV	Exhaust Gas Recirculation Electronic Vacuum Regulator Solenoid Valve – EGR Electronic Vacuum Regulator Solenoid Valve
Engine Calibration Unit – ECU	Programmable Read Only Memory – PROM
Evaporative Emission Control System – EECS	Evaporative Emission System – EVAP System
Exhaust Gas Recirculation/Thermostatic Vacuum Switch – EGR/TVS	Exhaust Gas Recirculation Thermal Vacuum Valve – EGR TVV
Fuel CAL-PAK Missing	Programmable Read Only Memory Missing – PROM Missing
High Energy Ignition – HEI	Distributor Ignition – DI
Lean Exhaust	Lean Heated Oxygen Sensor Signal – Lean HO ₂ S
Lean Exhaust	Lean Oxygen Sensor Signal – Lean O ₂ S Signal
Manifold Air Temperature Sensor – MAT Sensor	Intake Air Temperature Sensor – IAT Sensor
MEM-CAL Error	Erasable Programmable Read Only – Only Memory Error – EPROM Error
MEM-CAL Error	Programmable Read Only Memory Error – PROM Error
Memory and Calibration Unit – MEM-CAL	Erasable Programmable Read Only Memory – EPROM
Memory and Calibration Unit – MEM-CAL	Programmable Read Only Memory – PROM
Multi-Port Fuel Injection – MPFI	Multiport Fuel Injection – MFI
Oxygen Sensor – O ₂	Heated Oxygen Sensor – HO ₂ S
Oxygen Sensor – O ₂	Oxygen Sensor – O ₂ S
Park/Neutral Switch – P/N Switch	Park/Neutral Position Switch – PNP Switch
Port Fuel Injection – PFI	Multiport Fuel Injection – MFI
Pulse Air Injection System – PAIR	Pulsed Secondary Air Injection System – PAIR System
Revolutions Per Minute – rpm	Engine Speed – RPM
Rich Exhaust	Rich Heated Oxygen Sensor Signal – Rich HO ₂ S Signal
Rich Exhaust	Rich Oxygen Sensor Signal – Rich O ₂ S Signal
“Scan” Data	Scan Tool Data – ST Data
Service Engine Soon Indicator – SES Indicator	Malfunction Indicator Lamp – MIL
Thermal Vacuum Switch – TVS	Thermal Vacuum Valve – TVV
Thermostatic Air Cleaner – TAC	Air Cleaner – ACL
Throttle Body Injection – TBI	Throttle Body Fuel Injection – TBI
Throttle Position Sensor – TPS	Throttle Position Sensor – TP Sensor
Throttle Position Switch – TPS	Closed Throttle Position Switch – CTP Switch
Throttle Switch	Closed Throttle Position Switch – CTP Switch
Throttle Switch	Wide Open Throttle Switch – WOT Switch
Tuned Port Injection – TPI	Multiport Fuel Injection – MFI
Viscous Converter Clutch – VCC	Torque Converter Clutch – TCC

ABBREVIATIONS AND SYMBOLS

The following abbreviations and symbols may appear in this manual.

A

A-6 - Axial 6 Cylinder A/C Compressor
 A/C - Air Conditioning
 A/F - Air/Fuel (A/F Ratio)
 ABDC - After Bottom Dead Center
 ABS - (Body) Acrylonitrile-Butadiene-Styrene
 (Brake) Antilock Brake System
 ac - Alternating current
 AC - A GM Division
 ACC - Automatic Climate Control
 A/D - Analog-to-Digital
 ADF - Air Deflector Valve
 AIR - Air Injection Reaction
 Al - Aluminum
 ALC - Automatic Level Control
 AM/FM - Amplitude Modulation/Frequency
 Modulation
 amp - amperes
 API-GL - American Petroleum
 Institute-Gear Lubricant
 APS - Absolute Pressure Sensor
 APT - Adjustable Part Throttle
 ARS - Automatic Restraint System
 ASM - Assembly
 ASR - Acceleration Slip Regulation
 A/T - Automatic Transmission
 ATC - Automatic Temperature Control
 ATDC - After Top Dead Center
 ATS - Air Temperature Sensor
 Auto - Automatic
 avg - average
 AWD - All Wheel Drive
 AWG - American Wire Gage

B

B + - Battery positive
 BARO - Barometric
 batt - battery
 BBDC - Before Bottom Dead Center
 BCM - Body Control Module
 BHP - Brake Horsepower
 BLM - Block Learn Multiplier
 BP - Back Pressure
 BTDC - Before Top Dead Center
 Btu - British thermal units

C

°C - Celsius
 C LOOP - Closed Loop
 C3I, 3CI - Computer Controlled Coil Ignition
 CAD - Computer Aided Design
 CAM - Computer Aided Manufacturing
 CCOT - Cycling Clutch Orifice Tube

CCP - Controlled Canister Purge
 Cd - Cadmium
 CD - Compact Disc
 CEMF - Counter Electromotive Force
 cfm - cubic feet per minute
 cg - center of gravity
 CID - Cubic Inch Displacement
 ckt - circuit
 cm³ - cubic centimeters
 CO - Carbon Monoxide
 CP - Canister Purge
 CPA - Connector Position Assurance
 CPS - Central Power Supply
 CPU - Central Processing Unit
 CRT - Cathode Ray Tube
 CRTC - Cathode Ray Tube Controller
 CTS - Coolant Temperature Sensor,
 Coolant Temperature Switch,
 cu ft or ft³ - cubic foot, or feet
 cu in or in³ - cubic inch, or inches
 CV - Constant Velocity
 CYL - Cylinder(s)

D

dB - decibels
 dBA - decibels on A-weighted scale
 DBB - Dual Bed Bead
 DBM - Dual Bed Monolith
 dc - direct current
 DEC - Digital Electronic Controller
 dia - diameter
 DIFF - Differential
 DIS - Distributorless Ignition System
 DLC - Data Link Connector
 DRL - Daytime Running Lamps
 DVM - Digital Volt Meter
 DVOM - Digital Volt Ohm Meter

E

E/P - Ethylene/Propylene
 EAC - Electric Air Control
 EAS - Electric Air Switching
 EBCM - Electronic Brake Control Module
 ECC - Electronic Climate Control
 ECI - Extended Compressor at Idle
 ECS - Emission Control System
 ECU - Electronic Control Unit
 EDES - Electric Divert/Electric Air
 Switching Valve
 EEC - Evaporative Emission Control
 EECS - Evaporative Emissions Control System
 EES - Evaporative Emission System
 EEVIR - Evaporator Equalized Values
 in Receiver
 EFE - Early Fuel Evaporation
 EGR - Exhaust Gas Recirculation
 ELC - Electronic Level Control
 EMF - Electromotive Force

0A-18 GENERAL INFORMATION

EOS - Exhaust Oxygen Sensor
EPR - Exhaust Pressure Regulator
EPROM - Erasable Programmable Read
Only Memory
ESC - Electronic Spark Control
EST - Electronic Spark Timing
ETC - Electronic Temperature Control
ETCC - Electronic Touch Climate Control
ETR - Electronically Tuned Receiver
EVRV - Electronic Vacuum Regulator Valve

F

°F - Fahrenheit
FDC - Fuel Data Center
FEC - Fuel Evaporator Control
FED - Federal (all states except California)
FI - Fuel Injection
4WAL - Four Wheel Antilock
ft - foot, feet
FWD - Front Wheel Drive, Four Wheel Drive

G

g - gravitational acceleration, grams
GA - Gage
gal - gallon
gas - gasoline
GCW - Gross Combination Weight
Gen - Generator
GM - General Motors
gnd - ground
GVWR - Gross Vehicle Weight Rating

H

H - Hydrogen
H₂O - Water
H/CMPR - High Compression
HC - Hydrocarbons
HD - Heavy Duty
HDC - Heavy Duty Cooling
HEI - High Energy Ignition
hex - hexagon
Hg - Mercury
Hi Alt - High Altitude
hp - horsepower
HPL - High Pressure Liquid
HPV - High Pressure Vapor
HVAC - Heater-Vent-Air Conditioning
HVACM - Heater-Vent-Air Conditioning Module
Hz - Hertz

I

IAC - Idle Air Control
IC - Integrated Circuit
ID - Inside Diameter, identification
IDI - Integrated Direct Ignition
ign - ignition
ILC - Idle Load Compensator
INJ - Injection
I/P - Instrument Panel
ISC - Idle Speed Control

K

KAM - Keep Alive Memory
kg - kilogram
kHz - kilohertz
km/h - kilometers per hour
km/L - kilometers per liter
kPa - kilopascals
kV - kilovolts

L

L - Liter
lb. ft. - pound feet (torque)
lb. in - pound inch (torque)
LCD - Liquid Crystal Display
LF - Left Front
LH - Left Hand
LR - Left Rear
lt - left

M

M/C - Mixture Control
MAF - Mass Air Flow
Man - Manual
MAP - Manifold Absolute Pressure sensor
MAT - Manifold Air Temperature sensor
Max - Maximum
MDP - Manifold Differential Pressure
MEM-CAL - Memory and Calibration Unit
MFI - Multi-port Fuel Injection
mgd - million gallons per day
mi - miles
MIL - Malfunction Indicator Lamp
min - minimum
ml - milliliters
mm - millimeters
mpg - miles per gallon
mph - miles per hour
ms - millisecond
M/T - Manual Transmission
MV - Megavolt
mV - millivolt
MVSS - Motor Vehicle Safety Standards

N

NC - Normally Closed
NEG - Negative
NEU - Neutral
NLGI - National Lubricating Grease Institute
Ni - Nickel
N.m - Newton-meters (torque)
NO - Normally Open
NO₃ - Oxides of Nitrogen
NPTC - National Pipe Thread Coarse
NPTF - National Pipe Thread Fine

O

O2 - Oxygen
 OC - Oxidizing Converter
 OD - Outside Diameter
 OEM - Original Equipment Manufacturer
 ORC - Oxidizing Reducer Converter
 oz - ounce(s)

P

P/N - Park/Neutral
 PA - Polyamide
 PBT - Polybutylene terephthalate
 PC - Polycarbonate
 PCM - Powertrain Control Module
 PCV - Positive Crankcase Ventilation
 PE - Polyethylene
 PF - Phenol-Formaldehyde
 PM - Permanent Magnet (Generator)
 POA - Pilot Operated Absolute Valve
 POLYE - Polyethylene
 POLYF - Polyfoam
 P - Polypropylene
 POLYU - Polyurethane
 POS - Positive
 POT - Potentiometer (Variable Resistor)
 POM - Polyoxymethylene
 PP - Polypropylene
 PPE - Polyphenylene Ether
 ppm - parts per million
 PROM - Programmable Read Only Memory
 PS - Power Steering
 PSPS - Power Steering Pressure Switch
 psi - pounds per square inch
 psia - pounds per square inch absolute
 psig - pounds per square inch gage
 pt - pint
 PUR - polyurethane (thermoset)
 PWM - Pulse Width Modulated

Q

qt - quart(s)

R

R-4 - Radial Four Cylinder Air Compressor
 R-12 - Refrigerant-12
 R-134A - Refrigerant-R134A
 RAM - Random Access Memory
 (non permanent memory devise, memory
 contents are lost when power is removed)
 Ref - Reference
 RF - Right Front
 RFI - Radio Frequency Interference
 RH - Right Hand
 RIM - Reaction Injection Molded Urethane
 RPM - Revolutions Per Minute
 ROM - Read Only Memory (permanent memory
 devise, memory contents are retained
 when power is removed)

RPO - Regular Production Option
 RR - Right Rear
 RRIM - Reinforced Reaction Injection
 Molded Urethane
 rt - right
 RTV - Room Temperature Vulcanizing (sealer)
 RVB - Rear Vacuum Brake
 RVR - Response Vacuum Reducer
 RWAL - Rear Wheel Antilock
 RWD - Rear Wheel Drive

S

S - Seconds
 SAE - Society of Automotive Engineers
 SDM - Sensing and Diagnostic Module
 SEO - Special Equipment Option
 SES - Service Engine Soon
 SI - System International (modern version
 of metric system)
 Si - Silicone
 SIR - Supplemental Inflatable Restraint
 SMC - Sheet Molded Compound
 SO2 - Sulfur Dioxide
 sq ft, ft2 - square foot(feet)
 sq in, in2 - square inch(es)

T

TCC - Torque Converter Clutch
 TDC - Top Dead Center
 TEMP - Temperature
 THM - Turbo Hydra-Matic
 THERMAC - Thermostatic Air Cleaner
 TPE - Thermo Plastic Elastomer
 TPO - Thermo Plastic Olefin
 TPS - Throttle Position Sensor
 TPU - Polyurethane (Thermoplastic)
 TRANS - Transmission
 Turbo - Turbocharger
 TV - Throttle Valve
 TVRS - Television and Radio Suppression
 TVS - Thermal Vacuum Switch
 TXV - Thermal Expansion Valve

U

U-joint - Universal joint

V

V - Volt(s), Voltage
 V4 - Four Cylinder Engine
 V6 - Six Cylinder Engine
 V8 - Eight Cylinder Engine
 Vac - Vacuum
 VATS - Vehicle Anti-Theft System
 VDV - Vacuum Delay Valve
 vel - velocity
 VF - Vacuum Fluorescent
 VIN - Vehicle Identification Number

0A-20 GENERAL INFORMATION

VIR - Valves In Receiver
VLV - Vacuum Limiting Valve
VMV - Vacuum Modulator Valve
VRV - Vacuum Reducer Valve
VSS - Vehicle Speed Sensor

X

X-valve - Expansion valve

Y

W

yd - yard

W/S - Windshield
WOT - Wide Open Throttle
WSS - Wheel Speed Sensor

Z

Zn - Zinc

Figure 19 - Service Parts Identification Label

REPLACEMENT LABELS

Replacement labels are available through GM Service Parts Operations for the following:

- Vehicle Emission Control Information (Exhaust Emission Tune Up)
- Spare Wheel Caution
- Jacking
- Spare Tire Storage
- Serpentine Belt Routing (when it is a separate label)
- Engine Fan Caution
- IRS/SIR Service Caution
- Odometer Reset

These and other labels will be found in the Standard Parts Catalog. The Vehicle Certification Label, Tire Pressure Placard and Service Parts Identification Label are NOT available as service parts.

SERVICE PARTS IDENTIFICATION LABEL

Figures 19, 20 and 21

The Service Parts Identification Label has been developed and placed on the vehicle to aid service and parts personnel in identifying parts and options originally installed on the vehicle. The label is located on the underside of the rear compartment lid.

OPTION CODES

Vehicle options are identified on the Service Parts Identification Label by option codes. Option codes are three-digit combinations of letters and numbers. They identify equipment installed on the vehicle, and trim and paint colors. Refer to "Option and Process Codes" in this section.

Figure 20 - Service Parts Identification Label Location (Sedan)

Figure 21 - Service Parts Identification Label Location (Wagon)

OPTION AND PROCESS CODES

- AA7 - Window, Power Operated, Quick Opening
 AG1 - Adjuster, Frt Seat Power, 6 Way Driver, Split Bench
 AG2 - Adjuster, Pass Seat Power, 6 Way, Split Bench
 AG3 - Adjuster, Front Seat Power, 6 Way, 2 Position Memory
 AK5 - Restraint System Front Seat, Inflatable, Driver and Passenger
 AM5 - Seat, Front Split, Driver and Pass 6-Way Power Adj, Power Recline, Power Lumbar, 2-Way
 AM6 - Seat, Front Split With Center Armrest
 AN4 - Restraint Provisions, Child
 AP9 - Net, Convenience
 ARL - Plant Code Arlington, TX
 AS7 - Seat, Front Split
 AU0 - Lock Control, Remote
 AU4 - Lock, Side Door, Electric, Automatic
 A23 - Windshield, Heat Reflective
 A4G - Override Option of Canadian Requirements
 A75 - Seat Cushion, Back Frt, HD (SEO)
 A76 - Seat Cushion, Back Rear, HD (SEO)

SCHEDULED MAINTENANCE SERVICE

NORMAL VEHICLE USE

The maintenance instructions contained in the Maintenance Schedule are based on the assumption that the vehicle will be used as designed:

- To carry passengers and cargo within the limitation indicated on the Tire Placard located on the edge of the driver's door.
- On reasonable road surfaces within legal operating limits.
- On unleaded gasoline.

SCHEDULE I

Follow Schedule I if none of the driving conditions specified in Schedule II apply. Refer to Schedule I chart.

SCHEDULE I - Light Duty Service

- Use Schedule I if none of the conditions listed under Schedule II apply.

ITEM NO.	WHAT TO SERVICE See "Explanation of Scheduled Maintenance Services."	WHEN TO PERFORM Kilometers (Miles) or Months (Whichever Occurs First).
1.	Engine Oil and Oil Filter Change*	Every 12,500 km (7,500 mi.) or 12 months, or when the "CHANGE OIL" light comes on, whichever occurs first.
2.	Chassis Lubrication	
3.	Tire and Wheel Inspection and Rotation	At 12,500 km (7,500 mi.) and then every 25,000 km (15,000 mi.) or as necessary
4.	Rear Axle Fluid Change (Limited Slip Only, RPO-G80)	At the first 12,500 km (7,500 mi.) of use only.

0B-2 MAINTENANCE AND LUBRICATION

SCHEDULE I - Light Duty Service

- Use Schedule I if none of the conditions listed under Schedule II apply.

ITEM NO.	WHAT TO SERVICE See "Explanation of Scheduled Maintenance Services."	WHEN TO PERFORM Kilometers (Miles) or Months (Whichever Occurs First).
5.	Air Cleaner Filter Replacement*	Every 50,000 km (30,000 mi.)
6.	Fuel Tank, Cap and Lines Inspection*†	
7.	Front Wheel Bearing Repack	
8.	Engine Accessory Drive Belt Inspection	Every 100,000 km (60,000 mi.)
9.	Cooling System Service	Every 166,000 km (100,000 mi.)
10.	Sparkplug Replacement	
11.	Sparkplug Wire Inspection	

* = An Emission Control Service.

† = The U.S. Environmental Protection Agency or the California Air Resources Board has determined that the failure to perform maintenance item will not nullify the emission warranty or limit recall liability prior to the completion of vehicle useful life. General Motors, however, urges that all recommended maintenance services be performed at the indicated intervals and the maintenance be recorded.

T5762(Cont'd)

Schedule II

Follow Schedule II if the vehicle is operated under one or more of the following conditions:

- When most trips are less than 6 km (4 miles).
- When outside temperatures remain below freezing and when most trips are less than 16 km (10 miles).
- When most trips include extended idling and/or frequent low speed operation as in stop-and-go traffic.

- Towing a trailer. All Chevrolets and Buicks can tow 2000 lbs. (907 kg.). Vehicles equipped with RPO V92 can tow 5000 lbs. (2268 kg.). See the owners manual for more information.

- Operating in dusty areas.

- The vehicle is used in delivery service, as a Police or Taxi vehicle, or other commercial application.

Refer to Schedule II chart.

SCHEDULE II - Heavy Duty Service

Use Schedule I if any of the following conditions apply:

- Most trips are less than 8 to 16 km (5 to 10 miles).

This is particularly important when outside temperatures are below freezing.

- Most trips include extensive idling (such as frequent driving in stop-and-go traffic).
- Most trips are through dusty areas.
- You frequently tow a trailer or use a carrier on top of your vehicle.
- If the vehicle is used for delivery service, police, taxi, or other commercial application.

ITEM NO.	WHAT TO SERVICE See "Explanation of Scheduled Maintenance Services."	WHEN TO PERFORM Kilometers (Miles) or Months (Whichever Occurs First).
1.	Engine Oil and Oil Filter Change*	Every 5,000 km (3,000 mi.) or 3 months, or when the "CHANGE OIL" light comes on, whichever occurs first.
2.	Chassis Lubrication	Every other oil and filter change.
3.	Tire and Wheel Inspection and Rotation	At 12,500 km (7,500 mi.) and then every 25,000 km (15,000 mi.) or as necessary
4.	Rear Axle Fluid Change	See "Explanation of Scheduled Maintenance Services."
5.	Air Cleaner Filter Replacement*	Every 50,000 km (30,000 mi.)
6.	Fuel Tank, Cap and Lines Inspection*†	
7.	Front Wheel Bearing Repack	
8.	Automatic Transmission Service	See "Explanation of Scheduled Maintenance Services."
9.	Engine Accessory Drive Belt Inspection	Every 100,000 km (60,000 mi.)

T5763

SCHEDULE II - Heavy Duty Service

Use Schedule I if any of the following conditions apply:

- Most trips are less than 8 to 16 km (5 to 10 miles).
This is particularly important when outside temperatures are below freezing.
- Most trips include extensive idling (such as frequent driving in stop-and-go traffic).
- Most trips are through dusty areas.
- You frequently tow a trailer or use a carrier on top of your vehicle.
- If the vehicle is used for delivery service, police, taxi, or other commercial application.

ITEM NO.	WHAT TO SERVICE See "Explanation of Scheduled Maintenance Services."	WHEN TO PERFORM Kilometers (Miles) or Months (Whichever Occurs First).
10.	Cooling System Service	Every 166,000 km (100,000 mi.)
11.	Sparkplug Replacement	
12.	Sparkplug Wire Inspection	

* = An Emission Control Service.

† = The U.S. Environmental Protection Agency or the California Air Resources Board has determined that the failure to perform maintenance item will not nullify the emission warranty or limit recall liability prior to the completion of vehicle useful life. General Motors, however, urges that all recommended maintenance services be performed at the indicated intervals and the maintenance be recorded.

T5763(Cont'd)

EXPLANATION OF SCHEDULED MAINTENANCE SERVICES

Refer to the following chart for the schedule of time and/or mileage intervals. The following text and illustrations (Figures 1, 2 and 3) give details of the required maintenance services.

Engine Oil and Oil Filter Change

Figure 1

Change oil and filter every 12 500 km (7,500 miles) for schedule I, or every 5 000 km (3,000 miles) for schedule II, or when the "CHANGE OIL" light comes on, whichever comes first.

Oils recommended can be identified by looking for the "Starburst" symbol. This symbol indicates that the oil has been certified by the American Petroleum Institute (API). Do not use any oil which does not carry this "Starburst" symbol.

The "Change Oil" indicator on the instrument panel will illuminate when the oil needs to be changed, usually between 5 000 km (3,000 miles) and 12 500 km (7,500 miles) after the last reset. Under severe conditions, the indicator may illuminate before 5 000 km (3,000 miles). The vehicle should not be driven more than 12 500 km (7,500 miles) or twelve months without an oil change.

The system will not detect dust in the oil, so if the vehicle has been driven under dusty conditions, the oil should be changed every 5 000 km (3,000 miles), or sooner if the "Change Oil" indicator lamp illuminates.

Engine oil viscosity (thickness) has an effect on fuel economy and cold-weather operation (starting and oil flow). Lower viscosity engine oils can provide better fuel economy and cold-weather performance. However, higher temperature weather conditions require higher viscosity engine oils for satisfactory lubrication. Using oils of any viscosity other than

those recommended could result in engine damage. When choosing an oil, consider the range of temperatures the vehicle will be operated in before the next oil change. Then, select the recommended oil viscosity (Figure 1).

Engine Oil Life Monitor

After changing engine oil, reset the engine oil life monitor whether the "CHANGE OIL" warning/indicator lamp came on or not. Reset the engine oil life monitor as follows:

1. Turn ignition switch to "ON" position, but don't start engine.
2. Depress accelerator pedal to Wide Open Throttle (WOT) position and release it three times within five seconds.

Figure 1 - Engine Oil Viscosity Recommendation

0B-4 MAINTENANCE AND LUBRICATION

- The light is controlled by the PCM. The PCM is monitoring the TPS signal for three consecutive signals above 96 %. The PCM will acknowledge, if the reset has been successful by flashing the "Change Oil" light twice, then turning off the light.
- 3. If "CHANGE OIL" warning/indicator lamp goes out, system has been reset.
- 4. If "CHANGE OIL" warning/indicator lamp doesn't reset, turn ignition switch "OFF" and repeat procedure.
- If the engine oil life monitor operates improperly, refer to SECTION 6E3 (DTC 96).

Chassis Lubrication

Chassis lubrication is performed on the transmission shift linkage and the steering linkage and front suspension. Body lubrication should also be performed at least annually. Refer to "Body Lubrication" under "At Least Annually" in this section.

NOTICE: Do not lubricate the parking brake cables. Lubrication destroys the plastic coating on the cables.

Lubricate all grease fittings in the steering linkage and front suspension as described by the following:

Lubricating Joints That Have Grease Fittings

Figure 2

Wipe off all dirt from the grease fitting before lubricating the joint. Ball studs should not be lubricated unless their temperature is -12°C (10°F) or warmer. During cold weather, the ball stud should be allowed to warm up as necessary before being lubricated. Use a low-pressure grease gun on all studs to prevent seal damage.

Steering tie rods - Apply grease until grease flows out between seal and tie rod end housing.

Relay rod - Apply grease until grease flows around seal.

Idler arm - Apply grease while pushing up and pulling down on the idler arm, (this will prevent "grease lock"). Apply grease until grease is seen at the seal.

Ball studs - Apply grease slowly while watching grease seal. Apply grease until the seal expands or grease is seen bleeding from the seal. If the seal expands but no grease is seen, do not apply any more grease. Allow time for the grease to bleed from the seal.

All joints - Wipe off all excess grease.

Lubrication Fitting Locations

Refer to Figure 2 for lubrication fitting locations.

11 LUBE FITTINGS ●

01-18-95
BS00308

Figure 2 - Lubrication Fitting Locations

Tire and Wheel Inspection and Rotation

Figure 3

Check tires for abnormal wear or damage. To equalize wear and obtain maximum tire life, rotate as shown in Figure 3. If irregular or premature wear exists, check wheel alignment. Also, check for damaged wheels. Do not include the compact spare tire in rotation.

While the tires and wheels are removed, perform the brake systems inspection specified. Refer to "Each Time Oil Is Changed" in this section.

Rear Axle Fluid Change

If the vehicle is equipped with a limited slip rear axle RPO G80, Change the rear axle fluid after the first 10 000 km (6,000 miles) if maintaining vehicle under schedule I, or after the first 12 500 km (7,500 miles) if maintaining vehicle under schedule II. After the fluid has been changed for the first time, the fluid does not have to be changed again unless the vehicle is used to tow a trailer. If the vehicle is used to tow a trailer, then change the fluid every 10 000 km (6,000 miles).

Air Cleaner Filter Replacement

Replace every 50 000 km (30,000 miles) or 36 months, whichever comes first. Replace more often under dusty conditions.

Figure 3 - Recommended Tire Rotation Pattern

Fuel Tank, Cap and Lines Inspection

Inspect fuel tank, cap and lines for damage or leaks. Inspect fuel cap gasket for an even filler neck imprint or any damage. Replace parts as needed.

Front Wheel Bearing Repack

Clean and repack front wheel bearings at each brake relining or 50 000 km (30,000 miles), whichever comes first.

Transmission Service

For the automatic transmission, change both the fluid and the filter every 83 000 km (50,000 miles) if used under one of the following conditions listed below. Use DEXRON® III fluid, GM P/N 12346143. Refer to SECTION 7A for procedure.

- A. In heavy traffic where outside temperature regularly reaches 90° F (32° C) or higher.
- B. In hilly or mountainous terrain.
- C. When doing frequent trailer towing.
- D. Uses such as Taxi, Police, or delivery service.

If vehicle is not used under any of these conditions, the fluid and filter does not require changing.

Serpentine Drive Belt Inspection

Inspect serpentine drive belt for wear. Cracks in the belt ribs will not impair belt performance and are not a basis for belt replacement. If sections of the belt are missing, the belt should be replaced.

Cooling System Service

Drain, and refill system with GM Goodwrench DEX COOL™ coolant conforming to GM specification 6277 - M. When refilling system, add two engine coolant supplement pellets (GM P/N 3634621 or equivalent). Refer to SECTION 6B for procedure.

Spark Plug Replacement

The spark plugs have a platinum tip and need only be replaced every 160 000 km (100,000 miles). Replacement spark plugs are listed in "Maintenance Items" in this section.

Spark Plug Wire Inspection

Clean wires and inspect for burns, cracks or other damage. Check the wire boot fit at the ignition distributor and/or coil, and at the spark plugs. Replace the wires as needed.

OWNER INSPECTION AND SERVICES

Listed below are vehicle inspections and services that should be made by either the owner or a qualified technician at the frequencies indicated to help ensure proper safety, emission systems performance and dependability of the vehicle. Whenever repairs are necessary, have them completed at once. Any safety related or emissions related components that could have been damaged in an accident should be inspected and all needed repairs should be performed before operating the vehicle.

WHILE OPERATING THE VEHICLE

Automatic transmission shift indicator operation - Make sure the indicator points to the gear chosen. Refer to SECTION 7A for adjustment procedure, if necessary.

Horn operation - Blow the horn occasionally to make sure it works. Push down on inflatable restraint steering wheel module (air bag) to operate horn.

Brake system operation - Be alert to abnormal sounds, increased brake pedal travel or repeated pulling to one side when braking. Also, if the brake warning lamp or antilock brake system warning lamp goes on or flashes, something may be wrong with part of the brake system.

Exhaust system operation - Be alert to any abnormal sounds from the exhaust system or any smell of fumes within the passenger compartment. These are signs the system may be leaking or overheating. Inspect and repair at once.

Tires, wheels and alignment - Be alert to a vibration of the steering wheel or seat at normal highway speeds. This may mean a wheel balance is needed. Also, a pull right or left on a straight and level road may show the need for a tire pressure adjustment or a wheel alignment.

Steering system operation - Be alert to changes in steering action. An inspection is needed when the steering wheel is harder to turn, has too much free play, or if unusual sounds are noted when turning or parking.

Headlamp capsule aim - Take note of the light pattern. If beams seem to be improperly aimed, headlamps should be checked and adjusted as necessary. Refer to SECTION 8B.

AT EACH FUEL FILL

NOTICE: A fluid loss in any system (except windshield washer) may indicate a problem. Inspect the system and repair at once.

Engine oil level - The "LOW OIL" indicator lamp should be used as a back-up warning system and should not take the place of periodically checking the oil level. Check level and add oil if necessary. The best time to check the engine oil level is when the oil is warm. After stopping the engine with the vehicle on a level surface, wait a few minutes for the oil to drain back to the oil pan. Pull out the oil level indicator (dipstick). Wipe it clean, and push it back down all the way. Pull out the oil level indicator, keeping the tip down, and look at the oil level on it. Add oil, if needed, to keep the oil level above the "ADD" line and within the cross-hatched operating range area. Avoid overfilling as this may cause engine damage. Push the oil level indicator back down all the way after taking the reading. If you check the oil level when the oil is cold, do not run the engine first. The cold oil will not drain fast enough to give a true oil level.

Engine coolant level and condition - The "LOW COOLANT" indicator lamp will inform the driver when engine coolant level becomes low. This indicator lamp should not take the place of periodically checking the engine coolant. Check engine coolant level in the coolant reservoir and add 50/50 mixture of coolant and water if necessary. Inspect the coolant and replace it if dirty, rusty, or required as normal maintenance.

Windshield washer solvent level - The "LOW WASHER" indicator lamp will inform the driver if the washer solvent is low. Check washer solvent level in reservoir any time the hood is opened and add solvent if necessary.

Hood latch operation - When opening the hood, note the operation of the secondary latch. It should keep the hood from opening all the way when the primary latch is released. Make sure that the hood closes firmly. Refer to SECTION 10-5 for adjustment procedure.

AT LEAST MONTHLY

Tire and wheel inspection and pressure check - Check tires for abnormal wear or damage, especially if any suspension damage is noted. Also check for damaged wheels. Pressure should be checked when tires are "cold" (include spare tire). Maintain pressures as shown in "Tire Pressure Specifications" in this section, or the Tire Placard on the driver's door.

Lamp operation - Check operation of the license plate lamp, side marker lamps, headlamps (including high beams) taillamps, brake lamps (including the center high-mounted stoplamp), turn signals, backup lamps, hazard warning flasher and interior lamps.

Fluid level check - Periodically inspect the surface beneath the vehicle for water, oil, fuel or other fluids after the vehicle has been parked for a while. Water dripping from the air conditioning system after use is normal. The cause of fuel leaks or fumes should be found and corrected at once.

AT LEAST TWICE A YEAR

Power steering system reservoir level - Check and keep at proper level. Refer to SECTION 3B.

Brake master cylinder reservoir level - Check fluid. Refer to SECTION 5. Keep fluid at proper level. A low fluid level can indicate worn disc pads which may need to be serviced.

Weatherstrip lubrication - Clean the surface and then apply a thin film of silicone grease, GM P/N 12345579 or equivalent, using a clean cloth.

AT LEAST ANNUALLY

CAUTION: Before checking the holding ability of the parking brake and automatic transmission park mechanism, park on a fairly steep hill with enough room for movement in the downhill direction. To reduce the risk of personal injury or property damage, be prepared to apply the regular brakes promptly if the vehicle begins to move.

Parking brake and transmission park mechanism operation - To check the parking brake, with the engine running, transmission in "NEUTRAL," and parking brake set, slowly remove foot pressure from the regular brake pedal (until the vehicle is held only by the parking brake). To check the automatic transmission park mechanism holding ability, release all brakes after shifting the transmission to "PARK." If vehicle moves, check adjustment of steering column shift control linkage, refer to SECTION 7A. If OK refer to SECTION 7A-14B for transmission internal unit repair procedures.

CAUTION: Before performing the following transmission neutral start switch check, be sure to have enough room around the vehicle. Then, firmly apply both the parking brake and the regular brakes. Do not use the accelerator pedal. If the engine starts, be ready to turn off the ignition promptly. Take these precautions because the vehicle could move without warning and possibly cause personal injury or property damage.

Transmission neutral start switch operation - Try to start the engine in each gear. The starter should crank only in "PARK" and "NEUTRAL."

Brake transmission shift interlock (BTSI) operation - To check the brake transmission shift interlock (BTSI):

1. Ignition "ON" engine not running.
2. Apply parking brake.
3. Allow room for vehicle movement.
4. Transmission should not be able to shift out of "PARK" without first applying standard brakes.
5. If BTSI is inoperative, refer to SECTION 8A.

Steering column lock operation - While parked, try to turn the key to "LOCK" in each gear range. The key should turn to "LOCK" only when the gear selector is in "PARK." The key should come out only in "LOCK."

Lap and shoulder belts condition and operation - Inspect belt system, including webbing, buckles, latch plates, retractors, guide loops and anchors.

Movable head restraint operation - Make sure movable head restraints stay in the desired position.

Seatback recliner operation - Make sure the recliner is holding by pushing and pulling on the top of the seatback while it is reclined.

Spare tire and jack storage - Be alert to rattles in rear of the vehicle. Make sure the spare tire, all jacking equipment and any covers or doors are securely stowed at all times. Oil the jack screw mechanism after each use.

Key lock service - Lubricate the key lock cylinder (except instrument panel compartment lock).

Body lubrication service - Lubricate all body door hinges, including the hood, fuel door and rear compartment hinges with engine oil. The hood latch requires a special lubricant, refer to "Recommended Fluids and Lubricants" in this section.

Underbody flushing - At least every spring, flush from the underbody any corrosive materials used for ice and snow removal and dust control. Use plain water. Take care to thoroughly clean any areas where mud or other debris can collect. Sediment packed in closed areas of the vehicle should be loosened before being flushed.

Engine cooling system - Inspect coolant and freeze protection. If coolant is dirty or rusty, drain, and refill with GM DEX-COOL™ coolant conforming to GM specification 6277 - M. Add two engine coolant supplement sealant pellets, GM P/N 3634621 or equivalent. Keep coolant at the proper mixture for proper freeze protection. Inspect hoses and replace if cracked, swollen or deteriorated. Clean outside of radiator and air conditioning condenser. Wash filler cap and neck. To help ensure proper operation, a pressure test of both the cooling system and cap is also recommended.

EACH TIME OIL IS CHANGED

Engine oil life monitor ("CHANGE OIL" indicator) - Reset engine oil life monitor. Refer to "Engine Oil Life Monitor" in this section.

Automatic transmission fluid level - Maintain level within operating range on the oil level indicator. Refer to SECTION 7A.

Brake systems inspection - For convenience, the following should be done when wheels are removed for rotation: Inspect lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc. Inspect disc brake pads for wear and rotors for surface condition. Also inspect drum brake linings for wear and cracks. Inspect other brake parts, including drums, wheel cylinders, parking brake, etc., at the same time. Check parking brake adjustment, refer to SECTION 5F. Inspect brakes more often if habit or conditions result in frequent braking.

Steering and suspension inspection - Inspect front and rear suspension and steering system for damaged, loose or missing parts, signs of wear or lack of lubrication. Inspect power steering lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc.

Exhaust system inspection - Inspect complete system, including catalytic converter. Inspect body near the exhaust system. Look for broken, damaged, missing or out-of-position parts as well as open seams, holes, loose connections and other

0B-8 MAINTENANCE AND LUBRICATION

conditions which could cause a heat buildup in the floor pan or could let exhaust fumes seep into the rear compartment or passenger compartment. Check heat shields for proper clearance. Refer to SECTION 6F for exhaust system-to-body clearance specifications

Accelerator, cruise control and throttle valve cables - Inspect for interference, kinks, binding, damaged or missing parts.

Serpentine drive belt - Inspect serpentine drive belt for cracks, fraying, wear and proper tension. Replace tensioner or belt as needed. Refer to SECTION 6A4.

Rear axle assembly - Check fluid level and add if needed. To check or add fluid, hoist vehicle at suspension contact points. Refer to SECTION 0A. Keep vehicle level. Clean dirt or foreign material from around filler plug opening before removing the filler plug. Maintain fluid level from flush with bottom of opening to no lower than 6 mm (1/4 inch) below opening. Always replace filler plug. Tighten to 35 N.m (26 lb. ft.). If the vehicle is used to pull a trailer, change lubricant every 10 000 km (6,000 miles) of trailer tow use.

Radio power antenna service, three section type - Clean the power antenna as described in SECTION 9A.

RECOMMENDED FLUIDS AND LUBRICANTS

Engine oil - GM Goodwrench motor oil or equivalent for API service SG of recommended viscosity.

Engine coolant - Mixture of water and GM DEX-COOL™ antifreeze conforming to GM Specification 6277-M. If coolant is being replaced, add two engine coolant supplement sealant pellets, GM P/N 3634621 or equivalent.

MAINTENANCE ITEMS

Air Cleaner Filter.....	AC Type A1096 C
Engine Oil Filter.....	AC Type PF52
Fuel Filter.....	GM P/N 10253745
Spark Plug.....	AC Delco 41-943
Gap.....	1.27 mm (0.050 inch)

APPROXIMATE FLUID CAPACITIES

Air Conditioning	0.79 kg (1 lb. 12 oz.)
Engine Crankcase	
Without Filter Change	3.8 liters (4.0 qt.)
With Filter Change	4.8 liters (5.0 qt.)
Fuel Tank	
Sedan	87.0 liters (23 gal.)
Wagon	79.5 liters (21 gal.)
Automatic Transmission (4L60 - E)	
Drain & Refill	4.7 liters (10.0 pt.)
Overhaul	10.6 liters (22.4 pt.)
Cooling System	
4.3L Engine	
Without Heavy-Duty Cooling	16.8 liters (17.9 qt.)
With Heavy-Duty Cooling	17.1 liters (18.1 qt.)
5.7L Engine	
Without Heavy-Duty Cooling	15.5 liters (16.4 qt.)
With Heavy-Duty Cooling	15.9 liters (16.9 qt.)

The capacities shown are approximate. Add fluid as necessary to bring to an appropriate level.

Hydraulic brake system - Delco-Supreme 11® brake fluid (GM P/N 1052535) or equivalent DOT-3 brake fluid.

Power steering system - Power steering fluid meeting requirements of GM 9985010 (GM P/N 1050017, GM P/N 1052884 or equivalent). In cold climates GM P/N 12345867, GM P/N 12345866 or equivalent is recommended. (System should be drained and refilled prior to using this fluid).

Automatic transmission - DEXRON®-III automatic transmission fluid (GM P/N 12346143).

Key lock cylinders (except instrument panel compartment lock) - Lubricate lock cylinders with Multi-Purpose Lubricant (GM P/N 12345120) or 5W 30 synthetic motor oil.

Weatherstrips - Silicone grease (GM P/N 12345579 or equivalent).

Chassis lubrication - Chassis lubrication grease meeting requirements of NLGI Grade 2, category LB or GC-LB (or GM P/N 12346003).

Standard differential rear axle assembly - SAE 80W-90 GL-5 gear lubricant or axle lubricant (GM P/N 1052271, GM P/N 1052272 or equivalent).

Windshield washer solvent - GM Optikleen® washer solvent (GM P/N 1051515 or equivalent).

Hood latch and pivots - High temperature, water spray resistant grease (GM P/N 12345996 or equivalent).

Front wheel bearings - Lubricant (GM P/N 1051344 or equivalent).

Hood and door hinges, fuel door hinge, and rear compartment lid hinges - Engine oil or Lubriplate lubricant GM P/N 12346293.

WHEEL NUT TORQUE

Wheel Nut..... 135 N·m (100 lb. ft.)

REAR AXLE FILLER PLUG TORQUE

Rear Axle Filler Plug..... 35 N·m (26 lb. ft.)

BELT TENSION SPECIFICATIONS

Engines equipped with serpentine drive belts have an automatic tensioner. No adjustment of this belt is necessary.

VIBRATION DIAGNOSIS

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and joint clamping force, and may damage the fastener. When you install fasteners, use the correct sequence and tightening specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

VIBRATION

Among the problems encountered in the development and servicing of a vehicle, vibration conditions are perhaps the most difficult to identify and correct. This difficulty arises since the vibration the driver feels or hears is generally not the source of the problem, but rather a component responding to some external excitation, e.g., the steering wheel may vibrate due to the unbalance of a wheel, the engine, etc. Also, the source of the excitation may be built into the operation of the vehicle, and therefore cannot be eliminated (vehicle is normal) as in the case of the power pulses from the engine.

Vibration is a back and forth oscillation that can be seen, heard or felt. A vibration results from a system (group of parts) responding to an alternating excitation, the resulting motion being transmitted either visually (can be seen), audibly (can be heard) or physically (can be felt) to the occupants. A vehicle imbalance or misalignment is usually the cause of a vibration.

There are three ways to correct a vibration:

1. Eliminate the source of the vibration.
2. Interrupt the transfer path.
3. Stop the responder from responding.

DIAGNOSIS

REED TACHOMETER

Figures 1 and 2

To aid in the diagnosis of vibrations, a reed tachometer can be used to identify the frequency of a rotational component with a repetitive vibration (Figure 1).

Figure 1—Reed Tachometer

0C-2 VIBRATION DIAGNOSIS

The Biddle Frahm Reed Tachometer, or equivalent, measures vibration in cycles per minute (CPM). It consists of two rows of reeds. Each row is designed to vibrate at a particular frequency.

If you can match the rotational speed of a particular component with the frequency reading of the reed tachometer, you will know in which area to concentrate your efforts for repairs. Each component on a vehicle will vibrate at a natural frequency. This frequency acts like a fingerprint and will identify a component. For a particular component, this frequency will vary with vehicle speed and/or engine speed. These frequency relationships exist for all vibrations that occur in a vehicle, and understanding these relationships can often solve difficult vibration problems.

The reed tachometer should be placed on the top of the instrument panel for ease of viewing and for effective pickup of a vibration.

Some components may induce more than one vibration at a given speed. These multiple vibrations are referred to as the order of vibration. The order of vibration refers to the number of disturbances created by one rotation of a component. For example, a tire with one heavy spot will produce one disturbance each rotation, a first order vibration (Figure 2). An oval-shaped tire will produce two disturbances each rotation, a second order vibration. (Figure 2).

In general, the suspect component should be isolated to verify the cause of a vibration before parts are replaced. For a first order tire vibration, the responsible component can be anything which rotates at wheel and tire speed (i.e., wheels, tires, brake

rotors, brake drums). These can be serviced or replaced with known good parts to identify the component causing the vibration. Once verified, the component can be balanced or replaced as necessary.

Using a reed tachometer in a vehicle will take some practice. One of the more important things to be aware of when using the reed tachometer for the first time is that the reeds are very sensitive and will pick up many low amplitude vibrations. These will appear as slight movements of many reeds, and do not correspond to any particular component. Reed movement that corresponds to a vibrating component will be greater in amplitude, traveling the full range of the viewing area. Reed vibration will also change as engine speed or vehicle speed changes.

ELECTRONIC VIBRATION ANALYZER (EVA)

Figure 3

The Electronic Vibration Analyzer (EVA) J 38792 speeds up the diagnosis of vibrations (Figure 3). The EVA displays three predominant frequencies and their amplitudes in order from the strongest to the weakest.

The EVA is equipped with a vibration sensor that can be plugged into either input A or input B on the front of the EVA. The vibration sensor can be mounted almost anywhere on the vehicle using a magnet or adhesive putty. There is a trigger wire on the front of the EVA that a strobe light can be attached to for driveshaft balancing.

Figure 2—Order of Vibration

! Important

- The vibration sensor is marked with the word "UP" on one side. Mount the sensor in the horizontal position with the "UP" identification facing up. Mount the sensor as close as possible to the source of the vibration. Refer to the EVA instruction manual for information about sensor calibration.

CLASSIFYING A VIBRATION COMPLAINT

There are several excitation sources and many responding systems which may cause an annoying vibration. The first step is to identify the individual vibration complaints by systematically classifying them, during a road test, into one or more of the following categories:

1. Vehicle speed sensitive.
2. Engine speed sensitive.
3. Torque sensitive.
4. Jounce (load) sensitive.

In the process of classifying vibration problems in terms of these four sensitivity categories, you will find that many problems fit more than one of the categories. These four sensitivity categories can be combined into a list of five possible combinations into which a majority of vibration problems will fall:

- A. Engine speed sensitive only.
- B. Vehicle speed sensitive only.
- C. Torque sensitive and vehicle speed sensitive.
- D. Torque sensitive and engine speed sensitive.
- E. Torque sensitive, vehicle speed sensitive and jounce sensitive.

Since each of the categories has specific vibrations associated with it, determining which category(ies) the vibration falls into will give direction to the proper area for analysis of the problem. This will eliminate many components that cannot be the cause, and will focus attention on only those items that can contribute to the specific condition encountered.

Figure 3—Electronic Vibration Analyzer (EVA)

ROAD TEST

The road test is a very beneficial way to help the technician locate the vibration. If possible, the owner of the vehicle should be present for the road test to help point out the vibration complaint. The importance of riding in the vehicle with the owner cannot be overemphasized. If the condition is normal, and no corrective action is needed, the owner should be told so immediately. A normal condition can be demonstrated with other vehicles, pointing out that similar vehicles have the same condition. To help diagnose and isolate the source of a vibration, it is important to road test the vehicle and use a systematic approach in narrowing down the possible causes of a vibration.

! Important

- Before road testing the vehicle, check the following:
 - A. Tires for correct inflation pressure. Refer to the tire placard affixed to the driver's door jamb for tire inflation specifications.
 - B. Vehicle for correct load conditions. Refer to the tire placard affixed to the driver's door jamb for vehicle load specifications.
 - C. Wheel nuts for proper torque. Refer to SECTION 3E.
 - D. Engine mounts for proper torque. Refer to SECTION 6A4A.
 - E. All universal joint fasteners for tightness and correct torque. Refer to SECTION 4A.
- When did the vibration start?
- Did the vibration start after a repair?
 - Exhaust system
 - Undercoating
 - Tire repair or replacement
 - Wheel alignment
 - Engine repair
 - Other

The following questions should be used as a basic outline during the road test. These questions will enable you to eliminate many components and focus attention on only those items that can be responsible for the vibration complaint.

- Is it a noise? Can it be heard as well as felt?
- What type of noise is it?
 - Buzz
 - Moan
 - Rattle
 - Squeak
 - Shudder
- Where can the vibration be felt?
 - Seat
 - Floor
 - Steering Wheel
- Does the vibration occur on smooth or rough roads?
- When does the vibration occur?

Four major component groups are usually the cause of, or are related to the vibration:

1. Engine and mounts

0C-4 VIBRATION DIAGNOSIS

2. Transmission
3. Tires, wheels, brake drums and rotors
4. Propeller shaft and universal joints

The following list contains items that may cause vibration:

Inspect

1. Wheel alignment. Refer to SECTION 3A for wheel alignment specifications.
2. Tire treads for blisters or separations.
3. Tire or wheel for proper balance. Refer to SECTION 3E for specifications.
4. Wheel stud for excessive runout. Refer to SECTION 3 for specifications.
5. Brake drum or rotor for damage or deformation.
6. Steering linkage for wear. Refer to SECTION 3B3.
7. Trim height. Refer to SECTION 3 for trim height specifications.
8. Lower ball joints for wear or damage.
9. Wheel for excessive runout. Refer to SECTION 3E for wheel runout specifications.
10. Tire and wheel assembly for excessive loaded radial runout. Refer to SECTION 3 for radial runout specifications.
11. Universal joints for looseness or damage.

Coast Test

Drive the vehicle past the vibration speed, shift into neutral and coast back through the vibration speed. In this test two kinds of vibrations normally occur: a shaking or a buzzing. A shaking vibration is usually caused by tires or a wheel and brake drum/disc assembly problem. A buzzing vibration is usually caused by a driveline problem.

VEHICLE SPEED SENSITIVE

Tool Required:

TK-0-A TECH 1 Tester

Most vibration complaints are vehicle speed sensitive. The frequency of the excitation depends on the speed of the vehicle. To determine if a given problem is vehicle speed sensitive:

1. Connect a TECH 1 to the Data Link Connector (DLC) and display engine rpm. Refer to the TECH 1 operator's guide.
2. Drive the vehicle in high gear and record the vehicle speed and the engine speed at which the problem occurs.
3. Shift the vehicle into the next lowest gear and again record the vehicle speed and engine speed at which the problem occurs.
4. If the problem occurs at the same vehicle speed as when the vehicle was in high gear, the vibration is vehicle speed sensitive.

ENGINE SPEED SENSITIVE

Tool Required:

TK-0-A TECH 1 Tester

Another group of vibration complaints are engine speed sensitive. The frequency of the excitation depends only on the speed of the engine, independent of the vehicle speed. To determine if a given problem is engine speed sensitive:

1. Connect a TECH 1 to the Data Link Connector (DLC) and display engine rpm. Refer to the TECH 1 operator's guide.
2. Drive the vehicle in high gear and record the vehicle speed and the engine speed at which the problem occurs.
3. Shift the vehicle into the next lowest gear and again record the vehicle speed and engine speed at which the problem occurs.
4. If the problem occurs at the same engine speed as when the vehicle was in high gear, the vibration is engine speed sensitive.

TORQUE SENSITIVE

Tool Required:

TK-0-A TECH 1 Tester

A torque sensitive problem is one which increases in intensity as the torque (power) output of the engine increases. The intensity of the vibration increases as the throttle opening is increased. To determine if a given problem is torque sensitive:

1. Connect a TECH 1 to the Data Link Connector (DLC) and display engine rpm. Refer to the TECH 1 operator's guide.
2. Drive the vehicle in high gear and record the vehicle speed and the engine speed at which the problem occurs.
3. Observe the disturbance while varying the throttle position. That is, drive the vehicle with steady throttle, slowly increasing to heavy throttle by going uphill or applying the brakes while increasing the throttle opening and then slowly decreasing to minimum throttle by coasting through the disturbance.
4. If the disturbance becomes more severe as the throttle opening is increased, the vibration is torque sensitive.

JOUNCE OR LOAD SENSITIVE

A jounce or load sensitive problem is one which varies in intensity as the height of the vehicle changes with respect to the surface of the road. The intensity varies as the front shocks are extended or compressed. To determine if a given problem is jounce or load sensitive:

1. Drive the vehicle a number of times, changing the load each time and observing the disturbance.
2. Drive the vehicle over a road that dips in such a way that it causes the front of the vehicle to move up and down in relation to the surface of the road. Keeping a constant throttle, observe the disturbance.

3. If the condition varies depending on the passenger load (or varies as the front of the vehicle moves up and down), the problem is jounce or load sensitive.

Jounce sensitive vibrations may also be torque sensitive.

ON-VEHICLE SERVICE

ENGINE SPEED SENSITIVE ONLY

Problems in this category may be duplicated with the vehicle stopped and the transmission in neutral by running the engine at the speed which the disturbance was felt during the road test. All additional appraisals can thus be made under this "free engine" condition.

Engine speed sensitive problems can be due to the belt or engine-driven accessories (generator, A/C compressor, coolant pump, power steering pump). To isolate the offending component, first check the torque on all accessory bracket fasteners. Also, check the condition and tension of the drive belts. If any abnormal conditions are found, correct and retest for the vibration problem.

For generator fastener torque specifications and drive belt tension information, refer to SECTION 6D3. For A/C compressor fastener torque specifications and drive belt tension information, refer to SECTION 1B. For coolant pump fastener torque specifications and drive belt tension information, refer to SECTION 6B. For power steering pump fastener torque specifications and drive belt tension information, refer to SECTION 3B1.

If the vibration occurs after all accessory drive belts and fasteners have been properly adjusted and tightened, the accessory may have an internal problem such as bad bearings, bent shafts or imbalance. Repair or replace unsatisfactory parts until all accessories run smoothly.

If all accessories run smoothly and the vibration problem still exists, check for basic engine imbalance due to a defective or loose flywheel. For flywheel torque specifications, refer to SECTION 6A4A. Also, check for a defective or loose torque converter. For torque converter specifications, refer to SECTION 7A. If the vibration occurred after a major engine overhaul, the crankshaft balancer may be misaligned with the crankshaft, refer to SECTION 6A4A for installation procedure. For engine mechanical diagnosis, refer to SECTION 6.

A/C compressor problems can be diagnosed by turning the compressor off and on while the vibration condition is being experienced. Refer to SECTION 1B for air conditioning service procedures and proper drive belt tension specifications.

VEHICLE SPEED SENSITIVE ONLY

Figure 4

Vehicle speed sensitive vibration problems are usually related to tire and wheel imbalance or runout. Low speed vibrations, those occurring at less than 64 km/h (40 mph), are usually runout related. Highway speed vibrations, those speeds above 64 km/h (40 mph), can be caused by either imbalance

Figure 4—Causes of Vibrations

OC-6 VIBRATION DIAGNOSIS

or runout. For wheel and tire balancing procedures, refer to SECTION 3E. To investigate the possibility of wheel or tire runout, refer to SECTION 3. If a vibration remains after dynamic balancing, it can be caused by three things (Figure 4):

1. Tire runout.
2. Wheel runout.
3. Tire stiffness variations.

For service procedures concerning these three problems, refer to SECTION 3.

Another condition that is vehicle speed sensitive is a problem called "radial tire waddle." This condition is caused by a steel belt not being straight within the tire, or by excessive lateral runout of the tire or wheel. The vehicle can be road tested to determine which end of the vehicle has the faulty tire. If the waddle tire is on the rear, the rear end of the vehicle will shake from side to side or "waddle." From the driver's seat it feels as though someone is pushing on the side of the vehicle. For "radial tire waddle" service procedures, refer to SECTION 3.

TORQUE AND VEHICLE SPEED SENSITIVE

The only excitations which are both vehicle speed sensitive and torque sensitive (and possibly jounce sensitive) are disturbances caused by improper driveline angles which are a result of incorrect trim height or faulty universal joints. Check for the following:

- Worn or damaged universal joints. The universal joints should pivot smoothly. If universal joint binds or appears tight, replace the universal joint as an assembly. Refer to SECTION 4A for universal joint service procedures.
- Correct trim height. Refer to SECTION 3.

TORQUE AND ENGINE SPEED SENSITIVE

Vibration problems likely to be encountered in this class are as follows:

- A. Engine-driven accessories (generator, A/C compressor, coolant pump, power steering pump).
 - Engine-driven accessories generally do not present a problem if all fasteners are tightened to specifications and their respective drive belts are in good condition. Visually inspect each accessory to ensure that the brackets installed are complete and properly assembled.
 - For generator fastener torque specifications, refer to SECTION 6D3. For A/C compressor fastener torque specifications, refer to SECTION 1B. For coolant pump fastener torque specifications, refer to SECTION 6A4A. For power steering pump torque specifications, refer to SECTION 3B.
- B. Engine/transmission contacting the frame or body.
 - Inspect the vehicle to be certain that neither the engine or transmission is contacting the frame or body. If any irregularities are revealed during inspection, correct and retest on the road.

C. Exhaust system components.

- Visually inspect the exhaust manifold, intermediate pipe, muffler, catalytic converter and tailpipe for sufficient clearance of all points, refer to SECTION 6F for clearance specifications. Be particularly certain that sufficient clearance exists in all directions during engine torque load.
- A majority of exhaust system problems are due to "bound up" conditions. Loosen all joints in the entire system and rest the pipes on floor stands while each clamp and bolt is tightened to specifications. Refer to SECTION 6F for proper exhaust system torque specifications.
- Be certain that the end of the tailpipe is below the surface of the rear bumper fascia.
- After inspecting the exhaust system and making any corrections, retest on the road.

PROPELLER SHAFT

Driveline vibrations will generally be a high speed vibration associated with a "buzz" or a "shudder" occurring in the 72 to 88 km/h (45 to 55 mph) range. A majority of the vibration is experienced on either acceleration or deceleration. Driveline vibrations emanate from four general areas:

1. Propeller shaft balance.
2. Propeller shaft runout.
3. Driveline angles.
4. Joint phasing.

Most driveline vibrations that are associated with a "buzz" or a "shudder" type vibration will also have a high frequency reading on the reed tachometer or Electronic Vibration Analyzer (EVA). Refer to "Reed Tachometer" or "Electronic Vibration Analyzer (EVA)" earlier in this section.

Propeller Shaft Runout

If a noise vibration is present in the vehicle driveline, the propeller shaft may be bent or out of round due to damage. Inspect the propeller shaft for dents or other damage. The propeller shaft and its components must be "true" or turning with an absolute minimum amount of lateral movement. Refer to SECTION 4A for propeller shaft runout specifications.

Propeller Shaft Balance

If balance weights are loose or missing, the propeller shaft must be balanced or replaced. Refer to SECTION 4A for propeller shaft balance check procedures. Excessive looseness or wear at the propeller shaft sliding yoke splines may also cause a propeller shaft to be unbalanced. For propeller shaft inspections procedures, refer to SECTION 4A. Inspect propeller shaft and universal joints for mud buildup, undercoating buildup or loose fasteners.

UNIVERSAL JOINTS

Faulty universal joints can be another cause for driveline vibrations. If a universal joint is suspected of producing a rattling or knocking noise, the universal joint may be worn or loose. Make a preliminary inspection by grasping the propeller shaft toward the end near the suspected universal joint and rotate it back and forth, then, move the propeller shaft in an up and down direction while feeling for any looseness. If the propeller shaft shows excessive movement, the universal joint should be removed and inspected for wear or damage. Refer to SECTION 4A for universal joint diagnosis and service procedures.

DRIVELINE ANGLES

Vibrations due to improper driveline angles are caused by either incorrect trim height or faulty universal joints. Incorrect trim height can lead to excessive universal joint angles. Refer to SECTION 3 for trim height specifications. Faulty universal joints can lead to incorrect driveline angles. Refer to SECTION 4A for universal joint angle measurement procedures.

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

HEATER, VENTILATION, AND AIR CONDITIONING SYSTEM OPERATION

NOTICE: The refrigeration system on this vehicle uses R-134a which is not compatible with refrigerant R-12. Before servicing the system always make sure the proper servicing equipment is used or the system could become severely damaged. Always refer to the service text and manufacturer instructions included with service equipment before proceeding.

The Buick offers two air conditioning systems. The base system is the (C67) semi-automatic system and the optional system is the (C68) automatic system. The Chevrolet offers only one air conditioning system, the (C60) manual control system. The air conditioning system delivers air that has been heated or cooled and dehumidified for occupant comfort. It also provides power ventilation, and windshield and side window defrosting. During most operating conditions, outside air is drawn through the heater and air conditioning module by the blower motor. Additional outside air is also forced into the vehicle by forward movement of the vehicle. Within the heater and air conditioning module, air is pushed by the blower motor through the evaporator, then through the heater core then into the passenger compartment. For air conditioning or defroster operation, the refrigeration system will chill the evaporator to almost freezing. As the air passes through the evaporator, the air temperature drops which causes the moisture in the air to condense on the evaporator core fins. This moisture leaves the vehicle by gravity feed through a drain hose, dehumidifying the vehicle. From the evaporator, some or all of the air may pass through the heater core, which is warmed by engine coolant. Any of the air which is not to be heated will mix with the heated air before entering the passenger compartment. When maximum air conditioning mode is selected, most of

the air entering the blower motor is taken from the passenger compartment (recirculated) where it is most likely to be cooler than the outside air. Only outside air is used in all other modes.

Air Distributors and Outlets

There are four adjustable high-level air outlets in the instrument panel, two near the center and one at each extreme end of the panel. In addition, there are two side window defogger outlets, one at each end of the instrument panel upper trim pad. All six outlets are fed by the air distributor. Air can also be discharged from a floor air distributor centered on the transmission tunnel just below the instrument panel. This distributor feeds air to the front floor area and to the rear floor area through rear floor air outlets which run under the carpeting and exit through a cut out under the front seats. The windshield defoster nozzle is also fed by the air distributor.

Ventilation

Figure 1

The HVAC system provides fresh air ventilation for the passenger compartment in all operating modes. Even during "MAX A/C" mode, a small amount of air is taken from outside the vehicle. In all other modes, only outside air is used to feed the HVAC system. Even in the "OFF" mode, fresh outside air is forced into the air distribution system by the forward movement of the vehicle.

After being warmed or cooled to the desired temperature, the air is discharged from the outlets appropriate to the selected operating mode. When all windows are closed, the addition of outside air builds a slight positive pressure within the passenger compartment. The pressure forces stale air to leave the vehicle through a pressure relief valve (26) near the base of both body door lock pillars, after it has circulated through the passenger compartment.

REFRIGERATION SYSTEM

Figures 2 through 4

Refrigerant-134a

CAUTION: Avoid breathing A/C Refrigerant-134a and lubricant vapor or mist. Exposure may irritate eyes, nose, and throat. To remove R-134a from the A/C system, use service equipment certified to meet the requirements of SAE J2210 (R-134a recycling equipment). If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and lubricant manufacturers.

Like the coolant in the engine cooling system, the refrigerant is the substance in the air conditioning system that absorbs, carries and then releases heat. Although various substances are used as refrigerants in other types of refrigeration systems, past automotive air conditioning systems used a type called Refrigerant 12 (R-12).

This vehicle uses a refrigerant called Refrigerant-134a (R-134a). It is a nontoxic, nonflammable, clear, colorless, liquefied gas. While the R-134a A/C system is very similar to an R-12 A/C system, the differences in the refrigerant, lubricants, and service equipment are important.

Figure 1 - Ventilation Air Flow

Figure 2 - Refrigeration System Schematic

1B-4 HEATING AND AIR CONDITIONING

Figure 3 - Expansion Tube

Figure 4 - Air Conditioning Accumulator Components

NOTICE: R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. R-12 in a R-134a system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance.

Refrigerant-134a carries a charge of a special lubricating oil, polyalkylene glycol (PAG) refrigerant oil. GM PAG refrigerant oil will have a slight blue tint. The oil is hygroscopic (absorbs water from the atmosphere) and should be stored in closed containers.

Use only polyalkylene glycol (PAG) synthetic refrigerant oil for internal circulation through the R-134a A/C system and only mineral base 525 viscosity refrigerant oil on fitting threads and O-rings. If lubricants other than those specified are used, compressor failure and/or fitting seizure is likely to occur.

The air conditioning refrigeration system is designated as a CCOT (cycling clutch orifice tube) system. This designation refers to two components of the refrigeration system. In this system, the compressor clutch is cycled on and off to control compressor operation and cause the evaporator (1) to remain just above freezing temperature for most efficient cooling without icing.

An orifice or restriction within tube (14) is used to cause the refrigerant pressure to decrease which causes it to boil or vaporize inside evaporator (1). When it vaporizes, the refrigerant absorbs heat and cools the air flowing past the evaporator fins.

For heater-only or "ECON" modes, the refrigeration system is shut off so cooling is not provided. The amount of heating is governed by the proportions of the air directed through or around the heater core in the same manner as with air conditioning. The heater, ventilation, and air conditioning (HVAC) control in the instrument panel gives the operator a way to select the desired operating mode, air temperature and blower motor speed when the vehicle's ignition is on and the engine is running.

Air Conditioning Compressor

The compressor (4) is belt driven from the engine crankshaft through the compressor clutch pulley. The compressor pulley rotates without driving the compressor shaft until an electromagnetic clutch coil is energized. When voltage is applied to energize the clutch coil, the clutch plate and hub is drawn rearward toward the pulley. The magnetic force locks the clutch plate and pulley together as one unit to drive the compressor shaft.

As the compressor shaft is driven, the compressor (4) compresses the low pressure refrigerant vapor from the accumulator into a high pressure, high temperature vapor. Carried with the refrigerant is the refrigerant oil which is used to lubricate the compressor (4).

The compressor (4) has a unique lubrication system. The crankcase suction bleed is routed through the rotating wobbleplate for lubrication of the wobbleplate bearing. The rotation acts as an oil separator, which removes some of the oil from the crankcase suction bleed, rerouting it to the crankcase where it can lubricate the compressor mechanism.

Up to 118 ml (4 fluid ounces) of oil can collect in the crankcase. Therefore, it is important when replacing a compressor (4) that the oil in the old compressor crankcase be drained and measured (discard after recording amount). All service replacement compressors will have 237 ml (8 fluid ounces) of PAG oil in the crankcase. The oil must be drained and retained. After the old compressor is removed, the oil should also be drained, then measured. If less than 30 ml (1 fluid ounce) of oil is drained, add 30 ml (1 fluid ounce) of new oil to new compressor. If more than 30 ml (1 fluid ounce) is drained, add the same amount. For compressor overhaul, refer to SECTION 1D2.

3-24-94
BS0051B

Figure 5 - Refrigerant-134a System Performance Chart

1B-6 HEATING AND AIR CONDITIONING

Air Conditioning Condenser

The high pressure refrigerant vapor from compressor (4) goes to condenser (18) in front of the engine cooling system radiator. The condenser (18) is made up of coils which carry hot refrigerant vapor from the the compressor (4). Thin cooling fins on the coils transfer heat to the air passing through condenser (18). This cools the high pressure refrigerant vapor and causes it to condense into a high pressure liquid.

Expansion Tube

The plastic tube (14), also called the orifice tube, is in the enlarged portion at the forward end of the condenser outlet pipe. Inside tube (14) is a small, precisely sized passage called an orifice that restricts the flow of high pressure liquid refrigerant from condenser (18) on its way to evaporator (1). As a result of this restriction, the refrigerant leaves tube (14) as a low pressure liquid.

An extended plastic screen downstream of the orifice within tube (14) serves to reduce the flow noise associated with the pressure equalization when the system is shut off.

Tube (14) and orifice are protected from contamination by filter screens on both the inlet and outlet sides. Tube (14) cannot be adjusted or repaired and must be replaced as a unit.

Air Conditioning Evaporator

Air passing through evaporator (1) gives off some of its heat to the evaporator core fins when the refrigeration system is operating. The heat is conducted through the thin metal walls of the evaporator core to the low pressure liquid refrigerant flowing through the evaporator core tubes, causing the refrigerant to boil and vaporize. The refrigerant leaves evaporator (1) as a low pressure vapor, carrying off the heat it absorbed from the evaporator surfaces.

Air Conditioning Accumulator

The accumulator (2) is a sealed container mounted on the right front fender inner panel in the engine compartment. The accumulator (2) receives the refrigerant after the evaporator (1), before it is sent to the compressor (4). It serves as a refrigerant storage container and also separates any traces of liquid refrigerant that may be trapped in the vapor coming from the evaporator (1). The accumulator (2) allows no more than a slight trickle of this liquid refrigerant to go to the compressor (4) since any larger amount of liquid entering compressor (4) at one time could damage the compressor (4).

A small oil bleed hole in the outlet tube inside the lower end of the accumulator (2) prevents trapping of refrigerant oil by feeding it into the flow of refrigerant going to the compressor (4). This helps prevent oil starvation that could cause lubrication problems and failure of the compressor (4).

A bag of desiccant (a moisture absorbing material) in the base of the accumulator (2) collects and holds any traces of moisture in the refrigerant that could otherwise create problems such as corrosion or freezing in the refrigeration system.

The accumulator (2) should be replaced only if leaking as a result of perforation, a damaged O-ring seat or damaged threads, or if the system has been opened to outside air for an extended period.

HEATER SYSTEM

The water pump sends a constant supply of engine coolant through the heater core at all times. This supply of engine coolant is sent through a 5 gallon per minute flow restricter, located in the heater inlet hose. The flow restricter is used to prevent excessive rush of engine coolant through the heater core during high engine rpm's, which would result in possible premature heater core failure. This constant supply of engine coolant provides a heat source which is used by the HVAC module, which is controlled by the HVAC control to provide interior heating. For Buick, refer to SECTION 1C for insufficient heating diagnosis, or for Chevrolet, refer to SECTION 1B1 for insufficient heating diagnosis.

RELAYS AND SWITCHES

Air Conditioning Compressor Pressure Cycling Switch

The switch is mounted on the low side of the refrigeration system and is wired into the A/C request circuit to the powertrain control module (PCM). Since low side pressure is directly related to low side temperature, the switch has the ability to prevent the evaporator from freezing by turning off the compressor before low side pressures become too low. It also prevents the compressor from operating during low ambient temperature conditions, or if the system is low on refrigerant.

Air Conditioning Compressor Relay

The air conditioning compressor relay acts as an on/off switch in series circuit to the compressor clutch coil. When the powertrain control module (PCM) receives a signal indicating one or more specific operating conditions such as wide open throttle or excessive engine heat, the PCM opens the relay coil to open the relay contacts and break the compressor clutch circuit. This gives the PCM the ability to interrupt the operation of the air conditioning refrigeration system when necessary. The relay is located inside the underhood electrical center on the right hand fender inner panel.

Idle Speed Control Power Steering Pressure Switch

Engine idle quality is maintained by temporarily shutting off the compressor when high power steering loads are imposed. The switch in the power steering pressure hose closes at approximately 3 447 kPa (500 psi). The hydraulic pressure is an indicator of the load placed on the power steering pump. When the pressure is reduced, the switch opens.

Air Conditioning Refrigerant Pressure Sensor

The A/C refrigerant pressure sensor attached to the air conditioning compressor and condenser hose, senses refrigerant pressure on the air conditioning system high side. The refrigerant pressure status is sent to the PCM. The purpose of this sensor is to inform the PCM of high side pressure status so the PCM can:

1. Control cooling fan operation.
2. Disable the compressor before high side pressure becomes too high.

Refer to SECTION 6E3-C-10 for more information.

DIAGNOSIS

Some conditions which are normal to proper air conditioning system operation may lead an owner to wrongly suspect a problem.

Under conditions of high humidity, the air discharged from the air conditioning system may not feel as cold as expected. This is because the vaporized moisture in humid air holds heat more effectively than dry air, making the humid air harder to cool. In terms of overall comfort, however, the drier dehumidified air coming from the air conditioning system in hot, humid weather will evaporate more moisture on a person's skin and provide more of a cooling effect than might be felt from cooler but more humid air. This fact should be explained to a customer if no mechanical cause can be found for a persistent complaint of insufficient cooling.

The cycling clutch method of controlling evaporator temperature can cause some slight increases and decreases of engine speed and power which may be noticeable under certain conditions. This condition is normal and indicates that the air conditioning system is cycling to maintain full cooling capacity while avoiding icing of the evaporator.

If the engine is turned off with the air conditioning system operating, the refrigerant will flow from the high pressure side of the expansion tube through the orifice to the low pressure side until the pressure is equalized within the refrigeration system. The refrigerant flow may be heard as a hissing sound for as long as a minute after the engine stops. This is a normal condition.

INSUFFICIENT COOLING CHECK

If outside air temperature is above 21° C (70° F), the following procedure can be used to quickly determine whether the air conditioning refrigeration system has the proper charge of Refrigerant-134a. This check can be made in a few minutes, simplifying system diagnosis by localizing the problem to a low refrigerant charge or eliminating that possibility.

The engine must be at normal operating temperature and running at normal idle speed. The hood and all body doors must be open. The HVAC control must be set for maximum air conditioning, high blower motor speed and full cool temperature setting.

When the compressor is operating, feel the temperature of the evaporator inlet tube "downstream" from the expansion tube. Then feel the surface of the accumulator.

Compare and evaluate the temperatures of the two components. Proper operation with an adequate refrigerant charge is indicated if both the evaporator inlet tube and the accumulator feel much colder than the outside air and both seem to be at the same temperature.

If the evaporator inlet tube is cooler than the accumulator, or if the inlet has a coating of frost, a low refrigerant charge is indicated. The technician should leak test the refrigeration system and then recover and recharge system with 0.79 kg (1 pound 12 ounces) of R-134a refrigerant. If charge is correct, refer to SECTION 1C for Buick, or SECTION 1B1 for Chevrolet.

AIR CONDITIONING PERFORMANCE TEST

Figure 5

Tools Required:

J 39183-C R-134a Manifold Gauge Set or
J 39500-GM Air Conditioning Refrigerant Recovery, Recycling and Recharging (ACR-4) System

J 6742-03 Precision Thermometer

Performance testing provides a measure of air conditioning system operating efficiency by measuring and comparing pressures at the high pressure and low pressure sides of the refrigeration system, the temperature of the air being discharged into the passenger compartment, ambient air temperature and relative humidity.

Before making the air conditioning performance test, perform the HVAC system check. Refer to SECTION 1C.

The high-pressure gauge of J 39183-C or J 39500-GM should be connected to the high-pressure side service fitting on the compressor and condenser hose and the low-pressure gage of J 39183-C or J 39500-GM should be connected to the low pressure side service fitting on the accumulator. Both gage valves must be closed while making the connections. The center hose fitting of J 39183-C also must be closed, and must remain closed during the performance test.

The hood should be open and all doors and windows should be closed during the test. The HVAC control must be set for 16° C (60° F), "AUTO" mode and high blower motor speed. A high-volume fan should be placed in front of the radiator grille to ensure an adequate supply of air flow across the condenser. After idling the engine for five minutes, the engine speed should be increased to 2000 rpm for the test.

Just before making the performance test, the temperature and relative humidity of the ambient air (the air being blown against the condenser) should be determined. Then the temperature of the air being discharged from a center instrument panel outlet should be measured and low and high side

1B-8 HEATING AND AIR CONDITIONING

pressures on J 39183-C or J 39500-GM should be read. Record the readings and compare them to the data listed in Figure 5.

If operating temperatures and pressures are within the normal range, the refrigeration system can be considered to be operating properly. Slight variations from the published readings can be considered acceptable if experience has shown that such minor deviations do not indicate a problem.

REFRIGERATION SYSTEM CHECKS

If a faulty air conditioning refrigeration system is suspected because of abnormal refrigeration system pressures, the following items should be checked.

- Clogged fins in the radiator core or condenser core, blocking the airflow. Check between the condenser and the radiator, as well as the outer surfaces of these two components.
- Restrictions or kinks in the evaporator core, condenser core, hoses, tubes and other refrigerant passages.
- Refrigerant leaks.
- Air leaks or restrictions in air ducts. A low airflow rate may indicate a restricted evaporator core.
- Compressor clutch slippage.
- Improper drive belt tension.
- A plugged accumulator or expansion tube.
- Excessive moisture in the refrigeration system.

LEAK TESTING THE REFRIGERATION SYSTEM

A refrigerant leak test should be performed on the system whenever a leak is suspected due to system indication of low charge or after any service operation which disturbs the components, lines or connections. Remember care and diligence are the biggest keys to success.

Electric Halogen Leak Detector

Figures 6 and 7

Tool Required:

J 39400 Halogen Leak Detector

This type of leak detector has been found to be the most useful tool in locating refrigerant leaks. The J 39400 is a small unit which operates on 12 volts DC and provides an audible signal which increases in frequency when leaking refrigerant is detected. There are three settings: one for R-12, one for R-134a, and one for gross leaks. The gross leak setting is for isolating very large leaks already found at one of the other two settings. Care must be taken that the instrument is properly calibrated, per the included instructions, and that it is used at the proper setting for the type of refrigerant in the system being tested.

Figure 6 - Electric Halogen Leak Detector

Evaporator Core

Because the evaporator core is contained in a closed module and is inaccessible to leak detectors, it is one of the most difficult parts of the air conditioning system to check for leaks. To leak test the evaporator core:

1. Turn the blower motor on to high for 15 or more seconds then shut it off.
2. Wait 10 minutes.
3. Remove the blower motor resistor on C60 systems or the blower motor control module on C67 or C68 systems. Refer to SECTION 1B1 or 1C.
4. Insert the leak detector probe into the module opening. If the detector goes to a solid alarm, a leak has been found.

Compressor and Block Fitting

1. Blow shop air behind and in front of the compressor clutch/pulley for at least 15 seconds.
2. Probe the compressor area. If the detector goes to a solid alarm, a leak has been found.

Fluorescent Leak Detector

Tools Required:

J 41447 Tracer Dye

J 41436 Tracer Dye Injector

J 28428 High Intensity Black Light

R-134a refrigerant is uniquely different from R-12 refrigerant used in the past and may require additional methods to detect leaks. The R-134a molecule is smaller than the R-12 molecule and can leak through smaller openings. Also, R-134a does not contain chlorine which the electronic leak detectors found easy to identify. The tracer dye method is meant to be used in conjunction with the electronic leak detector and will pinpoint smaller leaks undetected by using the electronic leak detector. R-134a tracer dye requires time. Depending upon the rate of leak, it may take up to 7 days for the leak to become visible.

**Important**

- Tracer dye J 41447 has been developed to be used only with R-134a equipped vehicles or vehicles that have been retrofitted from R-12 to R-134a.
- Only J 41447 tracer dye is recommended for use in the R-134a system. Use of any other products may affect system reliability and cause premature compressor failure.
- Use only a 1/4 oz. charge of tracer dye. Larger amounts may compromise the reliability of the A/C system.
- After adding tracer dye, clean service valves and surfaces of residual dye with GM Engine Degreaser GM P/N 1050436 or equivalent to prevent false diagnosis.

DYE INJECTION

- Charged systems can be injected with tracer dye by using J 41436 Tracer Dye Injector along with the instructions provided.
- Discharged systems can have the tracer dye added to a replaced component, or can be added using the ACR4 unit.

Liquid Leak Detectors and Pressure Testing

Due to their lack of sensitivity, liquid/bubble leak detectors have very limited usefulness and are not recommended.

CAUTION: R-134a service equipment or vehicle A/C systems should not be pressure tested or leak tested with compressed air. Some mixtures of air/R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing injury or property damage. Additional health and safety information may be obtained from refrigerant and lubricant manufacturers.

ELIMINATING AIR CONDITIONING ODOR

Tool Required:

J 36645 A/C Evaporator Cleaning Gun

Some vehicles may experience odors emitted from the air conditioning system primarily at start up in hot, humid climates. This odor may be the result of debris in the evaporator module case and/or microbial growth on the evaporator core. To eliminate this condition, the following equipment and procedure should be used.

CAUTION: This procedure should only be performed on a cold vehicle to prevent the disinfectant from coming in contact with hot engine components which could cause irritating vapors to form.

Figure 7 - Checking for Refrigerant Leaks

1B-10 HEATING AND AIR CONDITIONING

Disinfectant can cause substantial, but temporary, eye injury. Avoid contact with eyes or clothing. Wash thoroughly with soap and water after handling disinfectant. If disinfectant gets into eyes, hold eyelids open and flush with a steady, gentle stream of water for fifteen minutes. Obtain medical attention if irritation persists.

Important

- This procedure will eliminate debris or microbial growth which can cause odors but will not prevent the possibility that debris or microbes present in the environment may return.
1. Pour small bottle of two part GM Goodwrench air conditioning system disinfectant kit, GM P/N 25533404 or equivalent, into large bottle. Seal and invert large container once or twice to mix contents.
 2. Connect battery charger to avoid draining battery during cleaning procedure.
 3. Remove blower motor resistor on (C60 or C67) or control module (C68), leaving electrical connectors attached. Refer to SECTION 1B1 or 1C.
- NOTICE:** Do not allow the metal heat sink of the blower motor control module to become grounded to any metal surface as this may result in internal circuitry damage.
4. Check evaporator module case for debris and remove any debris present through opening. If debris is imbedded into evaporator core face and cannot be removed, the core will have to be removed from vehicle and cleaned. If a large amount of debris is present in evaporator module case, the air inlet screen will require sealing around the windshield wiper post holes and fender edges.
 5. Turn ignition to the "RUN" position, but do not start vehicle.
 6. Set HVAC control to "ECON," 16° C (60° F) and low blower motor speed for C68 systems or "HEATER," full cold and "LOW" blower speed.
 7. Open all windows and doors and exit vehicle.
 8. Place drain pan with at least a two quart capacity below evaporator drain hole to collect disinfectant and rinse water runoff.
 - To prevent liquid from splashing on wiring harness and sound deadener, remove the 90° rubber hose from the evaporator drain pipe and attach a 0.60 m (2 foot) piece of 13 mm (0.5 inch) inside diameter, non reinforced hose to the evaporator drain pipe. Direct hose into drain pan.
 9. Position pedestal fan to provide cross ventilation during cleaning procedure. Turn on high.
 10. Use tool J 36645 or equivalent siphon type parts cleaning spray gun capable of delivering two ounces/minute of liquid when driven with 552 to

621 kPa (80 to 90 psi) of compressed air. Insert nozzle of spray gun through power module opening and insert siphon hose into container of disinfectant. Direct spray toward evaporator face taking extra care to ensure adequate coverage of the corners and edges, completely saturating the entire core. Use entire container of solution.

11. Turn ignition to the "OFF" position and allow core to soak for five minutes.
12. Check underneath vehicle to verify proper drain operation. If necessary, unclog drain hose.
13. Turn ignition to the "RUN" position, but do not start the vehicle.
14. Thoroughly rinse evaporator core with one quart of clean water using spray gun to remove any disinfectant residue.
15. Turn ignition to the "OFF" position and reinstall blower motor resistor (C60 or C67) or blower motor control module (C68). Refer to SECTION 1B1 or 1C.

CAUTION: Blower motor control module heat sink may be hot. To avoid danger of being burned, do not install control module when it is hot.

16. Dispose of disinfectant and rinse water runoff collected in drain pan in an approved manner.
17. Disconnect battery charger.

ON VEHICLE SERVICE

REFRIGERATION SYSTEM SERVICES

Replacing O-Rings (Seals)

Install new GM approved service replacement air conditioning O-rings when a joint or a fitting is installed, except when the O-rings are provided on new replacement components. Unless service replacement O-rings of the specified part numbers are used, excessive leakage of Refrigerant-134a may occur. Refer to the part number for identification, not to the former color coating method of identification, because some formerly color coated service replacement O-rings may be black.

Air conditioning O-rings should be coated with mineral oil 525 viscosity refrigerant oil just before installation and should be slipped onto the flange tube to assure proper locating and sealing. To prevent the possibility of swelling and a reduction in sealing effectiveness, O-rings should not be allowed to soak in refrigerant oil. Do not allow the mineral base 525 viscosity refrigerant oil to enter the refrigeration system, it is only used as an O ring lubricant.

Before installation, the O-rings and the fittings should be examined to insure that they have not been nicked or deformed. Nicked or deformed parts must be replaced or excessive refrigerant leakage may result.

Handling Refrigerant-134a

The air conditioning system in this vehicle contains Refrigerant-134a (R-134a). This chemical mixture requires special handling procedures to avoid personal injury.

Always wear goggles and wrap a clean cloth around fittings, valves, and connections when performing work that involves opening the refrigerant system. Always work in a well ventilated area and avoid breathing any refrigerant fumes. Do not weld or steam clean on or near any vehicle installed air conditioning lines or components.

If R-134a should come in contact with any part of the body, flush the exposed area with water and immediately seek medical attention.

CAUTION: Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose, and throat. To remove R-134a from the A/C system, use service equipment certified to meet the requirements of SAE J2210 or SAE J2209. If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and lubricant manufacturers.

- Do not store or heat refrigerant containers above 125° F (52° C).
- Do not heat a refrigerant container with an open flame; if container warming is required, place the bottom of the container in a pail of warm water.
- Do not intentionally drop, puncture, or incinerate refrigerant containers. Refrigerant will displace oxygen, therefore be certain to work in well ventilated areas to prevent suffocation.
- If it is necessary to carry a container of "Dot CFR" Refrigerant-134a in a vehicle, it should not be carried in the passenger compartment. Only containers that meet DOT SPEC 4BA or 4BW should be used.

NOTICE: R-12 refrigerant and R-134a refrigerant must never be mixed, even in the smallest of amounts, as they are incompatible with each other. If the refrigerants are mixed, compressor failure may occur.

Use only polyalkylene glycol (PAG) synthetic refrigerant oil for internal circulation through the R-134a A/C system and only mineral base 525 viscosity refrigerant oil on fitting threads and O-rings. If lubricants other than those specified are used, compressor failure and/or fitting seizure may occur.

Do not introduce compressed air to any refrigerant container or refrigerant component, because contamination will occur.

Before attempting any service which requires opening refrigeration system lines or components, refer to "Handling Refrigerant Lines and Fittings" and "Maintaining Chemical Stability in the Refrigeration System" that follow.

Carefully follow the instructions for refrigerant recovery and recycling, adding oil, evacuating, and recharging the refrigeration system.

All Refrigerant-134a disposable (colored blue) containers are shipped with a heavy metal screw cap to protect the valve and safety plug of the container from damage. It is good practice to replace the cap after each use of the container to continue protection.

Handling Refrigerant Lines and Fittings

CAUTION: For personal protection, goggles should be worn and a clean cloth wrapped around fittings, valves and connections when doing work that includes opening the refrigeration system. If Refrigerant-134a comes in contact with any part of the body, severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

- All metal tubing lines should be free of dents or kinks to prevent loss of system capacity due to line restriction.
- The flexible hose lines should never be bent to a radius of less than four times the diameter of the hose.
- The unprotected flexible hose lines should never be allowed to come within a distance of 63.5 mm (2.5 inches) of the exhaust manifold, 30 mm (1.2 inches) for protected hoses.
- Flexible hose lines should be inspected regularly for leaks or brittleness and replaced with new lines if deterioration or leaking is found.
- When disconnecting any fitting in the refrigeration system, the system must first be discharged of all Refrigerant-134a. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
- Once a refrigerant line is opened to the atmosphere, it should be capped or taped immediately to prevent entry of moisture and dirt.
- The use of the proper wrenches when making connections on O-ring fittings is important. The opposing fitting should always be backed up with a wrench to prevent distortion of connecting lines or components.
- Tighten all tubing connections to the specified torque for the fitting. Too little or too much torque when tightening can result in loose joints or deformed joint parts. Either condition can result in refrigerant leakage and an inoperative air conditioning system. Refer to "Fitting Tightening Specifications" at the end of this section.
- O-rings and seats must be in perfect condition. A burr or piece of dirt may cause a refrigerant leak.

1B-12 HEATING AND AIR CONDITIONING

Install new O-rings that have been lubricated with mineral base 525 viscosity refrigerant oil. Do not use PAG oil.

- Keep polyalkylene glycol (PAG) refrigerant oil off fitting threads. Long term contact of PAG oil on threads may cause future disassembly difficulties. Flush threads of fittings with mineral base 525 viscosity refrigerant oil. Do not use PAG oil. Do not wipe threads with a cloth.

Maintaining Chemical Stability in the Refrigeration System

The efficient operation and life of the air conditioning system is dependent upon the chemical stability of the refrigeration system. When foreign materials such as dirt, air, or moisture, contaminate the refrigeration system, the stability of the Refrigerant-134a and polyalkylene glycol (PAG) synthetic refrigerant oil will change. Contaminants will also affect pressure temperature relationship, reduce efficient operation and possibly cause interior corrosion and abnormal wear of moving parts.

The following general practices should be observed to ensure the chemical stability in the system:

- Before breaking a refrigerant connection, wipe away any dirt or oil to reduce the possibility of dirt entering the system. Both sides of the connection should be capped, plugged or taped as soon as possible to prevent the entry of dirt, foreign material and moisture.
- Keep tools clean and dry. This includes the manifold gage set and replacement parts.
- When adding polyalkylene glycol (PAG) synthetic refrigerant oil, the transfer device and container should be exceptionally clean and dry to assure that refrigerant oil remains as moisturefree as possible.
- When it is necessary to "open" an A/C system, have everything needed ready and handy so that as little time as possible will be required to perform the operation. Do not leave the A/C system open any longer than is necessary.
- Any time the A/C system has been "opened," it should be properly evacuated before recharging with Refrigerant-134a.
- All service parts are dehydrated and sealed prior to shipping. They should remain sealed until just prior to making connections. All parts should be at room temperature before uncapping. This prevents condensation of moisture from the air entering the system. If for any reason caps are removed but the connections are not made, parts should be resealed as soon as possible.

REFRIGERANT RECOVERY AND RECYCLING, ADDING OIL, EVACUATING AND RECHARGING PROCEDURES

General Description

Figure 8

The J 39500 air conditioning refrigerant recovery, recycling and recharging (ACR-4) system removes Refrigerant-134a from the vehicle A/C system, recycles and recharges all with one hookup.

Single pass filtering during recovery cycle, plus automatic multiple pass filtering during evacuation cycle assures constant supply of clean/dry refrigerant for A/C system charging.

NOTICE: R-12 and R-134a require separate and non interchangeable sets of recovery, recycling, and recharging equipment, because the refrigerants and lubricants are not compatible and cannot be mixed even in the smallest amounts. Do not attempt to use one set of equipment for both R-12 and R-134a, as all equipment contains residual amounts of refrigerant and/or lubricant, which will result in contamination, and damage to the recovery/recycle equipment. Adaptors to convert from one size fitting to the other must never be used; refrigerant/lubricant contamination will occur and system failure may result.

Figure 8 - Complete Operational Setup

STATION (ACR-4) SETUP AND MAINTENANCE**INITIAL SETUP**

Refer to the manufacturer instructions for all initial setup procedures.

OPERATION SETUP**Figure 8**

CAUTION: Always wear goggles and gloves when doing work that involves opening the refrigeration system. If liquid refrigerant comes into contact with the skin or eyes, injury may result.

CAUTION: Use only authorized 23 kg (50 pound) refillable refrigerant tanks (J 39500-50). Use of other tanks could cause personal injury and void the warranty.

NOTICE: Refrigerant-134a systems have special fittings (per SAE specifications) to avoid cross contamination with Refrigerant-12 systems. Do not attempt to adapt this unit to Refrigerant-12 systems as severe system failure will result.

Connect high side (red) and low side (blue) hoses to the ACR-4 unit. Be sure to route hoses through hose reel bracket grommets.

CONTROL PANEL FUNCTIONS**Figures 9 and 10**

This section explains the functions of the various components of the unit control panel (Figure 9).

Main Power Switch - supplies electrical power to the control panel.

Beeper - emits an audible tone to alert the operator to unit operating functions.

Digital Display - shows the time programmed for vacuum and the weight of refrigerant programmed for recharging.

Low Side Manifold Gage - when connected to an A/C system, this gage shows the system low side pressure.

High Side Manifold Gage - when connected to an A/C system, this gage shows the system high side pressure.

Moisture Indicator - shows if the refrigerant is wet or dry.

Low Side Valve - connects the low side of the A/C system to the unit.

High Side Valve - connects the high side of the A/C system to the unit.

In addition to the number keys, the control panel contains special keys that accomplish specific operating functions (Figure 10).

"RECYCLE" - activates the recycling sequence.

"RECOVER" - activates the recovery sequence.

"SHIFT/RESET" - activates "shifted" position of keys on the keypad and resets the program mode.

**Figure 9 - Control Panel****Figure 10 - Keypad Functions**

1B-14 HEATING AND AIR CONDITIONING

"FILTER" - automatically recovers and evacuates to 57 kPa (17 inches Hg) vacuum from the filter and low side of the unit.

"CHG" - automatically charges the A/C system with the programmed amount of refrigerant.

"HOLD/CONT" - interrupts the automatic cycle in the "HOLD" position, and then resumes functions in the "CONT" position. Press this button once for "HOLD" and again for "CONT."

"VACUUM" - activates the vacuum and automatic recycling sequence.

"ENTER" - enters programmed data into the unit control memory.

DIGITAL DISPLAY FUNCTIONS

For information regarding the functions of the digital display, refer to the manufacturer instructions.

MAINTENANCE

Refer to the manufacturer instructions for all maintenance procedures.

Refrigerant Recovery

Figures 8 through 11

! Important

- Use only the 23 kg (50 pound) unit refrigerant tank (J 39500-50) designed for the ACR-4. The unit overfill limitation mechanism has been calibrated specifically for use with this tank, and the tank valving is set up specifically for use with the unit.
 - Connect battery charger to vehicle battery to prevent battery drain.
1. Attach the high side (red) hose with the quick disconnect coupler to the high side refrigerant service valve fitting of the vehicle A/C system. This valve is located in the air conditioning compressor and condenser hose, between the air conditioning compressor and the condenser. Open the coupler valve after attachment.
 2. Attach the low side (blue) hose with the quick disconnect coupler to the low side refrigerant charge valve fitting of the vehicle A/C system. This valve is located on the air conditioning accumulator. Open the coupler valve after attachment.
 3. Check the high side and low side gages on the unit control panel to be sure the A/C system has pressure. If there is no pressure, there is no refrigerant in the system to recover.

! Important

- If there is no refrigerant in the A/C system, do not continue with the recovery operation. Air will be drawn into the recovery tank.
4. Open both the high side and the low side valves on the control panel (Figure 9).
 5. Open both the red "GAS" (vapor) and the blue "LIQUID" valves on the tank.

6. Slowly open the oil drain valve to see if the oil separator contains oil (Figure 8).
 - If any oil drains into the catch bottle at the bottom of the unit, allow it to drain until there is no more oil in the separator.
7. Close the oil drain valve.
 - Dispose of the oil in the catch bottle in an appropriate manner and return the bottle to its place on the unit.
8. Plug the unit into the proper voltage outlet and turn on the "MAIN POWER" switch.
9. Turn ignition switch "OFF," then back to "RUN," and blower motor to "HIGH." A battery charger should be connected to prevent battery drain.
10. Press "RECOVER" on the keypad. Before recovery begins, the unit will clear itself of refrigerant. "CLL" will appear on the display. The cleaning process takes from thirty seconds to three minutes to complete (Figure 11).

! Important

- Blower motor setting to "HIGH" will increase the rate at which refrigerant can be recovered.
11. When cleaning is complete. The unit will automatically start recovery, and the control panel display will show the unit is in the "RECOVER" mode of the "AUTOMATIC" cycle. Also, the weight of refrigerant being recovered will be displayed.

! Important

- Maintain A/C blower motor on "HIGH" during recovery operation.
12. The compressor shuts off automatically when initial recovery has occurred, at approximately 57 kPa (17 inches Hg) vacuum.
 13. At the end of the initial recovery process, the display shows "CPL" and then alternately flashes the weight of refrigerant recovered and "OIL/OZ" ("OIL/GMS").

! Important

- A small amount of A/C system lubricating oil polyalkylene glycol (PAG) might be removed with the refrigerant during recovery. The amount of oil removed (often there will be none) will vary greatly depending on a variety of conditions of the vehicle being serviced. The ACR-4 separates the oil from the refrigerant.
 - The "OIL/OZ" ("OIL/GMS") flashing is a reminder to always drain the recovered oil at this time. The same amount of oil must be replaced in to the A/C system later when the system is recharged with refrigerant.
14. Slowly open the oil drain valve and drain the oil into the calibrated oil catch bottle at the bottom of the unit (Figure 8).
 15. After the oil is completely drained, close the valve.
 16. Read and record the amount of oil removed in the catch bottle.
 17. Dispose of the recovered oil in an appropriate manner. Never reuse this oil.
 18. Check the control panel "LOW-SIDE GAGE."
 - If the A/C system has maintained a vacuum, the recovery is complete.
 19. If the "LOW-SIDE GAGE" pressure rises above "0," this indicates the presence of more refrigerant in the system. In this case, press the "HOLD/CONT" key on the keypad to recover the additional refrigerant. Repeat this step as needed until the system maintains vacuum for two minutes.

! Important

- If the display flashes "FULL" during the recovery process, and the unit shuts off, the unit tank is full.

- An empty unit tank (J 39500-50) must be installed to accommodate additional refrigerant, before proceeding to the next step in the recovery operation. Do not use any other kind of tank.
- It is possible to lower the amount of refrigerant in the unit tank by charging other vehicles.

Evacuation**Figures 12 and 13**

Make sure the unit tank has sufficient R-134a refrigerant for charging. Simultaneously press "RESET" and "ENTER" to enter the diagnostic mode, then press "6." The display must show 16 kg (36 pounds) or more. If less than 16 kg (36 pounds) is displayed, add new refrigerant to the tank. Refer to the manufacturer instructions for this procedure.

1. With the high side and low side hoses connected to the vehicle A/C system, open both the high side (red) and the low side (blue) valves on the unit control panel.
2. Open both the red "GAS" (vapor) and the blue "LIQUID" valves on the tank.

! Important

- To remove all the air and properly dry the A/C system, the unit automatically goes to a preprogrammed evacuation time.
 - It is possible to evacuate longer. Press keys to enter time desired. New entry will show on the display. Press "ENTER," the display will blink indicating input of data (Figure 12).
3. Press "VACUUM" to start the vacuum pump. The display counts down the vacuum time to zero to indicate operation time remaining. The display reads "RECYCLE" five seconds after the vacuum pump starts and continues while the process takes place.

! Important

- Automatic refrigerant recycling during each evacuation is a feature of the ACR-4 system. No action is required by the technician.

Figure 12 - System Evacuation (1 of 2)

Figure 13 - System Evacuation (2 of 2)

- The control panel “MOISTURE INDICATOR” must be green during recycling verifying refrigerant moisture content is within specifications. Yellow indicates a set condition requiring a filter/drier cartridge change. Refer to the manufacturer instructions for this procedure.
 - Noncondensable gases (mostly air) are automatically vented from the tank during the recycling process. An audible sound of pressure release may be heard as this happens. This is a normal function.
4. At approximately the 12 minute mark on the display (pump has run for three minutes), press “HOLD/CONT” key to stop vacuum pump (Figure 13).
 - A. A “0” vacuum reading indicates a major system leak. Repair leak and restart evacuation procedure.
 - B. If a vacuum reading of 91-101 kPa (27-30 inches of Hg) is indicated, close the low side and high side valves. Observe the vacuum level for a few minutes as a leak check of the A/C system. If vacuum is not maintained, find and repair the A/C system leak before continuing.
 - C. If a vacuum reading of 91-101 kPa (27-30 inches of Hg) is maintained, open the high side and low side valves and press the “HOLD/CONT” key to restart the vacuum pump.

5. When the vacuum sequence has run the programmed time, the display shows “CPL” to indicate that evacuation is complete.

**Important**

- The vacuum pump oil must be changed frequently.
- When the pump has run for a total time of ten hours, the message “OIL” will flash on the control panel display as a reminder to change the oil.
- If the “OIL” warning flashes during operation, press “CONT” and change the oil before the next operation. Refer to the manufacturer instructions for this procedure.

A/C System Oil Charge Replenishing

If oil was removed from the A/C system during the recovery process or due to component replacement, it must be replenished at this time. Refer to “Specifications” at the end of this section for proper oil capacities.

1. Select the graduated bottle of replenishing polyalkylene glycol (PAG) synthetic refrigerant oil (GM P/N 12345923 or equivalent).
2. Adjust the O-ring around the PAG oil bottle to the required oil charge level.
 - Example: If bottle oil level is at 4 ounces and 1/2 ounce of oil is required, adjust O-ring to 3 1/2 ounces as final level mark.
3. Install the bottle on the oil injection system on the back of the unit.

**Important**

- Keep the oil bottles tightly capped at all times to keep out moisture and contamination.
 - Do not open the oil injection valve while there is positive pressure in the A/C system. This will result in oil blowback through the bottle vent. A/C system vacuum is required for this operation.
 - Never let the oil level drop below the pickup tube while charging or replenishing. This will allow air into the A/C system.
4. Open the valve at the top of the plastic container and watch the level of oil being drawn into the system.
 5. Close the valve when the required oil charge has been pulled into the system.

Refrigerant Oil Loss Due to a Large Leak

If the refrigerant charge is abruptly lost due to a large refrigerant leak, approximately 90 ml (3 fluid ounces) of refrigerant oil will be carried out of the system suspended in the refrigerant. Any failure that caused an abrupt refrigerant discharge will experience this oil loss. Failures that allow the refrigerant to seep or bleed off over time do not experience this oil loss.

Upon replacement of a component which caused a large refrigerant leak, add 90 ml (3 fluid ounces) of new polyalkylene glycol (PAG) synthetic refrigerant oil (GM P/N 12345923 or equivalent) plus the required amount of oil for the particular component (as outlined above).

Add the oil directly to the replaced component if possible. If the oil cannot easily be added to the replaced part, add the oil during the recharging procedure.

COMPRESSOR

Up to 120 ml (4 fluid ounces) of oil can collect in the crankcase. Therefore, it is important when replacing a compressor that the oil in the old compressor crankcase be drained and measured (discard the oil after recording the amount). All replacement compressors will be shipped with approximately 240 ml (8 fluid ounces) of oil in the crankcase. The oil must be drained and retained. Then replace the oil in the same amount as previously recorded from the old compressor, if less than 30 ml (1 fluid ounce) of oil is drained from the old compressor add 30 ml (1 fluid ounce) of oil to new compressor.

Charging the A/C System (Engine Off)

Figures 8, 14 and 15

! Important

- The A/C system must be evacuated prior to charging.
 - Check that the "LB/KG" switch on the back of the unit to be sure it is set for the desired units of weight system (operate switch with main power "OFF").
1. Close the low side valve on the control panel.
 2. Open the high side valve on the control panel.
 3. Press "CHG" on the keypad to be sure the unit is in the program mode.
 4. Enter the amount of refrigerant charge to charge the A/C system by pressing the appropriate number keys. Be sure to use correct unit of weight (pounds or Kg).

! Important

- Charge A/C system with 0.79 kg (1 pound 12 ounces). Do not overcharge.
5. Press "ENTER."
 - A blink of the display indicates the charge amount is in the unit memory.
 6. Press "CHG" on the keyboard to begin the charging process.
 7. The display shows "AUTOMATIC" and the amount of refrigerant programmed for charging.
 - The display counts down to zero as the charging process proceeds.
 - At the end of the process, the display shows "CPL."

Figure 14 - System Charging (1 of 2)

! Important

- If the transfer of refrigerant stops before complete, refer to "Unsuccessful Transfer" that follows.

SUCCESSFUL TRANSFER COMPLETE

1. Close the high side valve on the unit control panel (both valves should now be closed).
2. Start the vehicle and the A/C system and let run until the readings on the high side and low side gages stabilize. Compare outlet temperature, ambient temperature, and humidity readings to the "Air Conditioning Performance Chart" in this section.
3. With the A/C system running, close the high side coupler valve and disconnect the high side (red) hose from the vehicle.
4. Open both the high side and low side valves on the control panel.

Figure 15 - System Charging (2 of 2)

5. Refrigerant from both hoses will be drawn quickly into the A/C system through the low side (blue) hose.
6. Close the low side coupler valve and disconnect from the vehicle.

UNSUCCESSFUL TRANSFER

On rare occasions, the total charge does not transfer to the vehicle A/C system. There are two reasons why this can occur.

1. If the transfer is too slow because the pressure in the unit tank and the vehicle A/C system are about the same, the unit will emit an audible signal and the display shows the weight remaining for transfer. In this case:
 - A. Close the high side valve (Figure 15).
 - B. Open the low side valve.
 - C. Start the vehicle A/C system, and press "HOLD/CONT" on the keyboard. This will put the remainder of the charge into the A/C system.
 - D. Continue with the previous procedure, "Successful Transfer Complete."
2. If the transfer will not complete and the display shows "CHECK REFRIGERANT," there is not enough refrigerant in the tank to complete the process. This condition requires the recovery of the partial charge of refrigerant in the vehicle A/C system and another complete evacuation and charge procedure.
 - A. Press "HOLD/CONT" on the keypad to interrupt the cycle.

B. Press "RESET" to reset the unit.

C. Recover the refrigerant that has been charged into the system, refer to "Refrigerant Recovery" in this section.

3. Add refrigerant to the tank following the manufacturer instructions, and refer to "Evacuation" in this section.

REPLACEMENT PROCEDURES

CAUTION: For personal protection, goggles should be worn and a clean cloth wrapped around fittings, valves and connections when doing work that includes opening the refrigeration system. If Refrigerant-134a comes in contact with any part of the body, severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

NOTICE: Tighten all hose and tube connections to the specified torque for the fitting. Too little or too much torque when tightening can result in loose joints or deformed joint parts. Either condition can result in refrigerant leakage and an inoperative air conditioning system. Refer to "Refrigerant Hose and Tube Tightening Specifications" at the end of this section.

Accumulator

Figure 16

The accumulator (2) should be replaced only if it is leaking from a perforation, damaged O-ring seal or damaged threads. It is not necessary to replace the accumulator (2) if the vehicle has been involved in a collision but no perforation of the outer shell is discovered, even if the outer shell is dented. The accumulator (2) should be replaced only when it is punctured and leaking, or if the refrigeration system has been left open to the outside air for an extended period of time, saturating the desiccant. Desiccant cannot be replaced separately; the complete accumulator (2) must be replaced if the original desiccant becomes saturated.

The service replacement accumulator package includes two new O-ring seals for the inlet and outlet connections.

Remove or Disconnect

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Hose (8) at accumulator (2).
 - A. Seal open end of hose (8) with tape or approved plastic caps to prevent dirt and moisture contamination.
 - B. Discard O-ring seal.
3. Hose (9) at accumulator (2).

Figure 16 - Refrigerant Lines and Hoses

A. Seal open end of hose (9) with tape or an approved plastic cap to prevent dirt or moisture contamination.

B. Discard O-ring seal.

4. Switch, if replacing accumulator. Refer to "Pressure Cycling Switch" in this section.

5. Accumulator (2).

A. Seal fitting openings with tape or approved plastic caps to prevent system contamination.

B. Loosen bolt/screw (15) enough to remove accumulator (2) from bracket (16).

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Refrigerant oil.

- Add 105 ml (3.5 fluid ounces) of polyalkylene glycol (PAG) oil GM P/N 12345923 to new accumulator (2).

2. Accumulator (2) to bracket (16).

3. Switch (3), if removed. Refer to "Pressure Cycling Switch" in this section.

4. Hose (9) and new O-ring seal to accumulator (2).

- Coat new O-ring seal with mineral base 525 viscosity refrigerant oil GM P/N 5416939 or equivalent just before installation.
- Do not allow oil to enter refrigeration system.

Tighten

- Hose (9) to 41 N-m (30 lb. ft.).
- Use two wrenches when making connection, a calibrated torque wrench and a backup wrench.

5. Hose (8) and new O-ring seal to accumulator (2).

- Coat new O-ring seal with mineral base 525 viscosity refrigerant oil GM P/N 5416939 or equivalent just before installation.
- Do not allow oil to enter refrigeration system.

Tighten

- Hose (8) to 41 N-m (30 lb. ft.).

1B-20 HEATING AND AIR CONDITIONING

- Use two wrenches when making connection, a calibrated torque wrench and a backup wrench.
6. Position accumulator (2) in bracket (16).
 - Position accumulator fittings to provisions on bracket (16).

Tighten

- Bolt/screw (15) to 6 N.m (53 lb. in.).
7. Evacuate and recharge air conditioning system. Refer to “Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures” in this section.
 8. Leak test fittings. Refer to “Leak testing the Refrigeration System” in this section.

Pressure Cycling Switch

Figure 16

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Electrical connector at switch (3).
3. Switch (3) and seal (17).
- Switch (3) is mounted on a Schrader® type valve so it is not necessary to discharge the refrigeration system.
- Discard seal (17).

Install or Connect

NOTICE: Refer to “Notice” on page 1B-1 of this section.

1. New seal (17) to switch fitting on accumulator (2).
- Coat seal (17) with mineral base 525 viscosity refrigerant oil GM P/N 12301108 or equivalent.
2. Switch (3).

Tighten

- Switch (3) to 4.5 N.m (40 lb. in.).
3. Electrical connector to switch (3).
 4. Battery negative cable.

Tighten

- Battery negative cable to 17 N.m (13 lb. ft.).

Air Conditioning Condenser

Figure 17

Remove or Disconnect

1. Recover refrigerant. Refer to “Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures” in this section.
2. Air intake duct and resonators.
3. Upper fan shroud, if vehicle is equipped with a mechanical engine cooling fan. Refer to SECTION 6B.
4. Electric engine cooling fan(s). Refer to SECTION 6B.
5. Radiator upper mounting panel, if vehicle is not equipped with a mechanical engine cooling fan. Refer to SECTION 6B.
6. Compressor and condenser hose-to-condenser fitting and condenser-to-evaporator tube fitting.
 - Discard seals.
 - Plug open fittings.
7. Condenser (18).
 - Tilt top edge of radiator rearward and slide condenser out between radiator and radiator support.
8. Insulators (19) from upper corners of condenser (18).
9. Insulators (20) from radiator support (21), if necessary.
10. Expansion tube from lower condenser fitting. Refer to “Expansion Tube” in this section.

Inspect

- Fittings for nicks, burrs or dents. Fittings must be in perfect condition.
- Expansion tube for contamination. Blow off any metal chips, flakes, slivers or other contaminants with an air hose. If any damage is noted, replace expansion valve.

Install or Connect

NOTICE: Refer to “Notice” on page 1B-1 of this section.

1. PAG refrigerant oil.
 - If condenser (18) is new or drained, add 30 ml (1 fluid ounce) of new PAG refrigerant oil GM/PN 12345923 or equivalent. This can be done before installing the condenser or during the evacuating and recharging procedure.
2. Expansion tube to lower condenser fitting. Refer to “Expansion Tube” in this section.
 - New condensers will have expansion tube installed. Do not reuse old expansion tube if condenser was replaced.
3. Insulators (10) to radiator support (21), if removed.

Figure 17 - Air Conditioning Condenser

4. Insulators (19) to upper corners of condenser (18).
 - Position as shown in Figure 17.
 5. Condenser (18).
 - Tilt top edge of radiator rearward and slide condenser (18) between radiator and radiator support.
 - Condenser (18) must seat in insulators (19).
 6. Compressor and condenser hose-to-condenser fitting, and condenser-to-evaporator tube fitting.
 - A. Unplug fittings.
 - B. Lubricate new seals with mineral base 525 viscosity refrigerant oil GM/PN 12301108 and install.
- Tighten**
- Compressor and condenser hose-to-condenser fitting to 24 N.m (18 lb. ft.).
 - Condenser-to-evaporator tube fitting to 24 N.m (18 lb. ft.).
7. Radiator upper mounting panel, if vehicle is not equipped with a mechanical engine cooling fan. Refer to SECTION 6B.
 8. Electric engine cooling fan(s). Refer to SECTION 6B.
 9. Upper fan shroud, if vehicle is equipped with a mechanical engine cooling fan. Refer to SECTION 6B.
 10. Air intake duct and resonators.
 11. Evacuate and recharge air conditioning system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
 12. Leak test fittings. Refer to "Leak testing the Refrigeration System" in this section.

Air Conditioning Compressor

Figures 16 and 18

Remove or Disconnect

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Radiator fan upper shroud and radiator outlet hose and pipe, if vehicle is equipped with a mechanical engine cooling fan. Refer to SECTION 6B.
3. Nut (22).
4. Hose (8) from compressor (4).
 - Plug open lines and ports.
 - Discard seals (25).
5. Raise and suitably support vehicle. Refer to SECTION 0A.
6. Serpentine drive belt. Refer to SECTION 6A4A.
7. Drive belt tensioner. Refer to SECTION 6A4A.
8. Bolts/screws (23 or 24).
9. Nut (27).
 - Use a 9/16 inch deepwell socket and 3/8 drive ratchet.

Figure 18 - Air Conditioning Compressor Mounting

- If unsuccessful, remove right engine mount through bolt/screw and slightly raise engine for additional clearance.

- Electrical connector at compressor (4).
- Compressor (4).
- Bolts/screws (28) and brace (29), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

- Polyalkylene glycol (PAG) refrigerant oil.
 - If compressor (4) is being replaced, drain refrigerant oil from both defective compressor and new replacement compressor. Measure amount removed from defective compressor. If measured amount is less than 30 ml (1 fluid ounce), add 30 ml (1 fluid ounce) to new replacement compressor. If more than 30 ml (1 fluid ounce) is drained from defective compressor add same amount to new compressor. Use PAG refrigerant oil GM P/N 12345923 or equivalent.
- Brace (29) and bolts/screws (28), if removed.

Tighten

- Bolts/screws (28) to 25 N.m (18 lb. ft.).
- Compressor (4).
 - Electrical connector at compressor (4).

- Nut (27).
- Do not tighten at this time.
- Bolts/screws (23 or 24).

Tighten

- A. Bolts/screws (23 or 24) to 50 N.m (37 lb. ft.).
- B. Nut (27) to 41 N.m (30 lb. ft.).

- Lower engine, if raised.
- Engine mount through bolt/screw, if removed.

Tighten

- Engine mount through bolt/screw to 95 N.m (70 lb. ft.).
- Drive belt tensioner. Refer to SECTION 6A4A.
 - Serpentine drive belt. Refer to SECTION 6A4A.
 - Lower vehicle.
 - Seals (25) to hose (8).
 - Coat seals (25) with 525 viscosity mineral base refrigerant oil GMP/N 12301108.
 - Hose (8) to compressor (4).
 - Nut (22).

Tighten

- Nut (22) to 35 N.m (26 lb. ft.).
- Radiator outlet hose and pipe, and radiator fan upper shroud, if removed. Refer to SECTION 6B.

16. Charge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
17. Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

Air Conditioning Refrigerant Service Valve

Figure 16

Tool Required:
J 39037 Octagon Socket

Remove or Disconnect

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Valve cap (30).
3. Service valve (31).
 - Use J 39037 to remove valve.

Install or Connect

1. Service valve (31).
 - Coat seal (32) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
 - Use J 39037 to install valve.
2. Valve cap (30).
 - Make sure valve cap has seal.
3. Evacuate and recharge the A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
4. Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

Air Conditioning Refrigerant Pressure Sensor

Figure 16

Remove or Disconnect

1. Electrical connector at sensor (13).
2. Sensor (13) and seal (33).
 - Sensor (13) is mounted on a Schrader® type valve so it is not necessary to discharge the refrigeration system.
 - Discard seal (33).

Install or Connect

1. New seal (33) to sensor fitting.
 - Coat seal (33) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
2. Sensor (13).

Tighten

- Sensor (13) to 6 N·m (53 lb. in.).
3. Electrical connector to sensor (13).

Expansion Tube

Figure 19

Tool Required:
J 26549-E Expansion Tube Remover

Remove or Disconnect

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

2. Battery negative cable.
3. Condenser-to-evaporator tube fitting.
 - A. Seal open end of evaporator tube with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - B. Discard seal (34).
4. Expansion tube (14) with J 26549-E from condenser outlet pipe.
 - If expansion tube (14) is restricted or plugged, and is difficult to remove, the following procedure is recommended:
 - a. Remove as much residue as possible.
 - b. Carefully apply heat with heat gun, such as a hair dryer or an epoxy dryer near open end of condenser outlet pipe. Do not overheat pipe.
 - c. While applying heat, grip expansion tube (14) with J 26549-E and use a twisting push-pull motion to loosen impacted expansion tube (14) and remove it.

Clean

- Expansion tube (14), if it is to be reused.
 - A. Blow off any metal chips, flakes, slivers and other contaminants with air hose.
 - B. Clean expansion tube (14) in solvent and dry it.

Inspect

- Expansion tube (14), if it is to be reused.
 - a. Discard if plastic frame is broken.
 - b. Discard if filter screen is torn, damaged or plugged with fine gritty material.
 - c. Discard if brass orifice tube is damaged or plugged.

Install or Connect

1. Expansion tube (14).
 - A. Coat expansion tube seal with mineral base 525 viscosity refrigerant oil.
 - B. Insert expansion tube (14) into open end of condenser outlet pipe as shown in Figure 19. Install expansion tube (14) until it stops, indicating proper seal seating.

Figure 19 - Expansion Tube

2. Seal (34) to evaporator tube (10).
 - Coat new seal (34) with mineral base 525 viscosity refrigerant oil GM P/N 12301108 and fit onto evaporator tube (10).
3. Condenser-to-evaporator tube fitting.

 Tighten
 - Condenser-to-evaporator tube fitting to 24 N.m (18 lb. ft.).
4. Battery negative cable.
5. Charge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
6. Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

Air Conditioning Compressor and Condenser Hose

Figure 16

Remove or Disconnect

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Electrical connector from sensor (13).
3. Clip (37) from compressor and condenser hose (8).
4. Compressor and condenser hose fitting at accumulator (2).

- Discard seal (35).
 - Seal open end of accumulator (2) with tape or an approved plastic cap to prevent dirt or moisture contamination.
5. Compressor and condenser hose fitting-to-condenser fitting.
 - Use a backup wrench to hold condenser fitting while loosening compressor and condenser hose fitting.
 - Discard seal (36).
 6. Nut (22).
 7. Compressor and condenser hose (8).
 - Discard seals (25).

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Clean fittings with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
 - Do not allow refrigerant oil to enter A/C system.
2. Seals (25) to compressor and condenser hose (8).
 - Lightly coat seals (25) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
3. Compressor and condenser hose (8) into position.
4. Nut (22).

**Tighten**

- Nut (22) to 41 N.m (30 lb. ft.).
- Seal (36) to compressor and condenser hose (8).
 - Lightly coat seal (36) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
 - Compressor and condenser hose-to-condenser fitting.

**Tighten**

- Compressor and condenser hose-to-condenser fitting to 24 N.m (18 lb. ft.).
- Seal (35) to compressor and condenser hose fitting.
 - Lightly coat seal (35) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
 - Compressor and condenser hose fitting to accumulator (2).

**Tighten**

- Compressor and condenser hose fitting to 41 N.m (30 lb. ft.).
- Clip (37) to compressor and condenser hose (8).
 - Electrical connector to sensor (13).
 - Evacuate and recharge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
 - Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

Air Conditioning Evaporator Tube**Figures 19 and 20****Remove or Disconnect**

- Refrigerant.
 - Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
- Condenser to evaporator tube fitting.
 - Seal open end of condenser with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - Discard seal (34).
- Evaporator tube (10) at evaporator (1).
 - Remove nut (39) holding evaporator tube (10) to evaporator inlet port.
 - Pull evaporator tube out of evaporator, being careful not to bend tube (10).
 - Seal open evaporator inlet port with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - Discard seal (40).

**Install or Connect****NOTICE:** Refer to "Notice" on page 1B-1 of this section.

- Evaporator tube (10) to evaporator (1).

Figure 20 - Tube and Hose Attachment at Evaporator

1B-26 HEATING AND AIR CONDITIONING

- A. Remove tape or cap from open end of evaporator inlet port.
- B. Coat new seal (40) with clean mineral base 525 viscosity refrigerant oil GM P/N 12301108 and install it.
- C. Install evaporator tube (10) to evaporator (1).
- D. Install nut (39) at evaporator inlet port.

Tighten

- Nut (39) to 16 N.m (12 lb. ft.).
2. Condenser-to-evaporator tube fitting.
 - Coat new seal (34) with mineral base 525 viscosity refrigerant oil GM P/N 12301108 and install it.

Tighten

- Condenser-to-evaporator tube fitting to 24 N.m (18 lb. ft.).
3. Refrigerant.
 - Evacuate and recharge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.

Accumulator Hose

Figures 16 and 20

Remove or Disconnect

1. Refrigerant.
 - Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Accumulator hose-to-accumulator fitting.
 - A. Seal accumulator (2) with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - B. Discard seal (36).
3. Accumulator hose (9) at evaporator (1).
 - A. Remove nut (43) holding accumulator hose (9) to evaporator outlet port.
 - B. Pull hose (9) out of evaporator (1).
 - C. Discard seal (44).

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Seal (44) to accumulator hose (9).
 - Coat new seal (44) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
2. Accumulator hose (9) at evaporator (1).
 - A. Push hose (9) into evaporator outlet port.
 - B. Nut (43).

Tighten

- Nut (43) to 16 N.m (12 lb. ft.).

3. Seal (36) to accumulator hose (9).
 - Coat seal (36) with mineral base 525 viscosity refrigerant oil GM P/N 12301108.
4. Accumulator hose-to-accumulator fitting.

Tighten

- Accumulator hose-to-accumulator fitting to 41 N.m (30 lb. ft.).
5. Evacuate and recharge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
 6. Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

Evaporator

Figures 16 & 20

Remove or Disconnect

1. Refrigerant.
 - Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Hose (9) at evaporator (1).
 - A. Remove nut (43) holding hose (9) to evaporator outlet port.
 - B. Pull hose (9) forward to remove it.
 - C. Seal open end of hose (9) with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - D. If you do not intend to proceed immediately to the following step, seal open evaporator outlet port with tape or an approved plastic cap.
 - E. Discard seal (44).
3. Evaporator tube (10) at evaporator (1).
 - A. Remove nut (39) holding tube (10) to evaporator inlet port.
 - B. Pull tube (10) forward to remove it.
 - C. Seal open evaporator inlet port with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - D. Seal opened end of tube (10) with tape or an approved plastic cap to prevent dirt or moisture contamination.
 - E. Discard seal (40).
4. Studs (42) using a female E7 TORX® socket.
5. Heater core cover. Refer to "Heater Core Cover" in this section.
6. Evaporator mounting bracket bolt/screw and bracket.
7. Evaporator (1).
 - Slide evaporator (1) rearward, then down, to remove it.

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Evaporator (1).
 - Studs (42) must be removed during installation.
2. Evaporator mounting bracket and bolt/screw.

**Tighten**

- Bolt/screw to 1.9 N·m (17 lb. in.).
3. Heater core cover. Refer to “Heater Core Cover” in this section.
 4. Refrigerant oil.
 - Add 90 ml (3 fluid ounces) of fresh polyalkylene glycol (PAG) refrigerant oil GM P/N 12345923, if evaporator (1) was replaced.
 5. Studs (42) using a female E7 TORX® socket.
 6. Tube (10) to evaporator inlet port.
 - A. Remove tape or cap from the open end of evaporator inlet port and tube (10).
 - B. Coat a new seal (40) with clean mineral base 525 viscosity refrigerant oil GM P/N 12301108 or equivalent and install it.
 - C. Install tube (10) to evaporator inlet port.
 - D. Install nut (39) at evaporator inlet port.

**Tighten**

- Nut (39) to 16 N·m (12 lb. ft.).
7. Hose (9) to evaporator outlet port.
 - A. Remove tape or cap from open end of evaporator outlet port and hose (9).
 - B. Coat a new seal (44) with clean mineral base 525 viscosity refrigerant oil GM P/N 12301108 or equivalent and install it.
 - C. Install hose (9) to evaporator outlet port.
 - D. Install accumulator hose nut (43) at the evaporator outlet port.

**Tighten**

- Accumulator hose nut (43) to 16 N·m (12 lb. ft.).
8. Evacuate and recharge A/C system. Refer to “Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures” in this section.
 9. Leak test fittings. Refer to “Leak Testing the Refrigeration System” in this section.

Blower Motor**Figure 21****Remove or Disconnect**

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Right hand instrument panel insulator. Refer to SECTION 8C.
3. Blower motor electrical connector.

4. Right hand body hinge pillar trim panel by pulling it away from front body hinge pillar.
5. Bolts/screws (45) and blower motor cover.
 - A. Remove two bolts/screws (45), allowing third bolt/screw (45), nearest right hand rear corner of module to remain in place.
 - B. Remove third bolt/screw (45) while supporting motor (46).
6. Motor (46).
 - Remove isolator (47) from blower motor flange, if necessary.

**Install or Connect**

NOTICE: Refer to “Notice” on page 1B-1 of this section.

**Important**

- The impeller is part of a blower motor service kit. The kit is preassembled and balanced. Therefore, do not attempt to separate the impeller from the blower motor.

1. Motor (46).
 - Position isolator (47) on blower motor flange.
 - Align motor (46) with opening in bottom of module and carefully move motor (46) up and into position.
2. Bolts/screws (45).

**Tighten**

- Bolt/screw (45) to 1.9 N·m (17 lb. in.).
3. Right hand body hinge pillar trim panel by pressing it into position until retainers snap into place.
 4. Blower motor electrical connector.
 5. Right hand instrument panel insulator. Refer to SECTION 8C.
 6. Battery negative cable.

**Tighten**

- Battery negative cable to 17 N·m (13 lb. ft.).

Rear Defogger Relay**Figure 21****Remove or Disconnect**

CAUTION: Refer to “Caution” under “Disconnecting Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Right hand instrument panel insulator. Refer to SECTION 8C.
3. Electrical connector at relay (48).
4. Bolt/screw (49).
5. Relay (48).

Figure 21 - Blower Motor Area from Below

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Relay (48).
2. Bolt/screw (49).

Tighten

- Bolt/screw (49) to 1.9 N·m (17 lb. in.).
3. Electrical connector to relay (48).
 4. Right hand instrument panel insulator. Refer to SECTION 8C.
 5. Battery negative cable.

Tighten

- Battery negative cable to 17 N·m (13 lb. ft.).

Heater Inlet and Outlet Hoses

Figure 22

Remove or Disconnect

1. Drain engine cooling system. Refer to SECTION 6B.
2. Bolts/screws (50).
3. Radiator fan upper shroud, if vehicle is equipped with a mechanical cooling fan.

4. Fan belt, if vehicle is equipped with a mechanical fan.
5. Clamps (51) at water pump.
6. Hoses (52 and 53) at water pump.
7. Coolant recovery reservoir hose at hose tee.
8. Clamps (51) at heater core ports.
9. Heater outlet and inlet hoses (52 and 53).

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Heater outlet and inlet hoses (52 and 53).
2. Clamps (51) at heater core ports.
3. Coolant recovery reservoir hose at hose tee.
4. Hoses (52 and 53) to water pump.
5. Clamps (51) at water pump.
6. Fan belt, if removed.
7. Radiator fan upper shroud, if removed. Refer to SECTION 6B.
8. Bolts/screws (50).

Tighten

- Bolts/screws (50) to 1.9 N·m (17 lb. in.).
9. Refill and bleed engine cooling system. Refer to SECTION 6B.

Figure 22 - Heater Hoses

Heater Core

Figures 22 & 25

↔ Remove or Disconnect

1. Drain engine coolant. Refer to SECTION 6B.
2. Heater inlet and outlet hose clamps (51) from heater core inlet and outlet tubes.
3. Heater outlet and inlet hoses (52 or 53) from heater core.
4. Heater core cover. Refer to "Heater Core Cover" in this section.
5. Heater core.
 - A. Remove heater core mounting straps and bolts/screws.
 - B. Pull heater core rearward, working heater core inlet and outlet tubes out of seal.

→← Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Heater core.
 - A. Move heater core into position, carefully guiding heater core inlet and outlet tubes through round holes in tube seal at cowl panel.
 - B. Install heater core mounting straps and bolts/screws.
2. Heater core cover. Refer to "Heater Core Cover" in this section.

3. Heater outlet and inlet hoses (52 or 53) to heater core.
4. Heater inlet and outlet clamps (51) to heater core inlet and outlet tubes.
5. Refill and bleed engine coolant. Refer to SECTION 6B.

🔍 Inspect

- With engine warmed up and running, and with HVAC control set for maximum heating, inspect heater outlet and inlet hoses (52 and 53) for leaks.
- Also carefully feel hoses (52 and 53) to ensure that warm engine coolant is flowing through heater core.

Heater and Air Conditioning Module

Figure 23

Heater and air conditioning module (57) must be removed to permit removal of vacuum tank.

↔ Remove or Disconnect

1. Refrigerant.
 - Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Drain engine coolant. Refer to SECTION 6B.

1B-30 HEATING AND AIR CONDITIONING

Figure 23 - Heater and Air Conditioning Module

Figure 24 - Instrument Panel - (Chevrolet)

Figure 25 - Heater Core Cover

3. Heater outlet and inlet hoses (52 and 53) from heater core.
4. Accumulator hose (9) and evaporator tube (10) from evaporator (1).
 - A. Remove accumulator hose and evaporator tube nuts (39 and 43) and slide hose (9) and tube (10) forward and off studs (42).
 - B. Discard seals (40 and 44).
 - C. Seal open ends of both accumulator hose (9) and tube (10) with tape or an approved plastic cap to prevent dirt or moisture contamination.
5. Instrument panel. Refer to SECTION 8C.
6. Air distributor and tie bar. Refer to SECTION 8C.
7. Floor air distributor. Refer to SECTION 8C.
8. Windshield defroster nozzle. Refer to SECTION 8C.
9. Air inlet grille panels. Refer to SECTION 10-5.
10. Windshield wiper transmission access hole cover bolts/screws and cover.
11. Vacuum supply hose connector at bottom of module (57).
12. Bolts/screws (55) and nuts (56).
 - Remove three bolts/screws (55) and one nut (56) from the engine compartment first, then remove two nuts (56) from the passenger compartment.
13. Module (57).
 - Slide module (57) rearward, tilting it as necessary to be sure heater core tubes and evaporator refrigerant line connections are clear of holes in cowl panel before removing module (57) from two cowl panel studs.

**Install or Connect**

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Module (57) and two nuts (56).
 - A. Move module (57) forward, positioning two upper tabs onto cowl panel studs for support.
 - B. Carefully guide heater core tubes, evaporator refrigerant line connections and stud near refrigerant line connections through appropriate holes in cowl panel.
 - C. Install two nuts (56) onto two dash panel studs, but do not tighten them.
2. Bolts/screws (55) and nut (56).
 - A. From engine compartment, verify that heater core tubes, evaporator refrigerant line connections and module mounting stud are properly positioned and holes for bolts/screws (55) are aligned.
 - B. Install three bolts/screws (55). Tighten in proper sequence.

Tighten

- Bolts/screws (55) to 2.8 N.m (25 lb. in.).
- C. Install stud nut (56).

Tighten

- Nut (56) to 6 N.m (53 lb. in.).

3. Dash panel nuts (56).

Tighten

- Nuts (56) to 6 N.m (53 lb. in.).

- Vacuum supply hose connector.
- Windshield wiper transmission access hole cover and bolts/screws.
- Air inlet grille panels. Refer to SECTION 10-5.
- Windshield defroster nozzle. Refer to SECTION 8C.
- Floor air distributor. Refer to SECTION 8C.
- Air distributor and tie bar. Refer to SECTION 8C.
- Instrument panel. Refer to SECTION 8C.
- Accumulator hose (9) and evaporator tube (10) to evaporator (1).
 - Remove tape or plastic caps from open ends of hose (9), tube (10) and both evaporator ports.
 - Coat seals (40 and 44) with clean mineral base 525 viscosity refrigerant oil GM P/N 12301108 just before installation.
 - Slide hose (9) and tube (10) into position onto mounting studs (42), then install accumulator hose fitting and evaporator tube fitting nuts (39 and 43).

Tighten

- Accumulator hose and evaporator tube fitting nuts (39 and 43) to 16 N.m (12 lb. ft.).

- Heater outlet and inlet hoses (52 and 53) to heater core.
- Refill and bleed engine cooling system. Refer to SECTION 6B.

Inspect

- With engine warmed up and running, and with HVAC control set for maximum heating, inspect heater outlet and inlet hoses (52 and 53) for leakage.
- Evacuate and recharge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
 - Leak test fittings. Refer to "Leak Testing the Refrigeration System" in this section.

HEATER CORE COVER

Figure 25

The heater core cover must be removed from the module to gain access to the evaporator and heater core.

Remove or Disconnect

- Right hand instrument panel insulator and instrument panel lower reinforcement. Refer to SECTION 8C.
- Right-Hand floor carpet retainer. Refer to SECTION 10-6.
- Instrument panel trim plate for Chevrolet or instrument panel lower trim plate for Buick. Refer to SECTION 8C.
- Instrument panel upper trim pad for Chevrolet. Refer to SECTION 8C.
- Bolts/screws (67) for Chevrolet.
- Bolt/Screw (68), nut (69), and brace (70) for Chevrolet.
- Pull right lower corner of instrument away from dash [approximately 25 mm (1 inch)] and support for Chevrolet.
- Vacuum harness connectors at heater core cover (62).
 - Disconnect both connectors, then remove connector halves from heater core cover.
 - Position vacuum harnesses out of the way.
- Roll floor carpet back to provide access to forward lower area of module (57).
- Heater core cover bolts/screws (61).
 - There are seven bolts/screws (61) attaching the flange of the heater core to the rest of the shell of the module.
 - The bolt/screw (61) near the center of the flange next to the cowl panel (the forward flange) may be difficult to locate. The bolt/screw head is straight down from the vacuum tank and almost directly below the lower righthand heater core tube. The bolt/screw can be reached for removal or installation with a 7 mm socket attached to a universal joint adapter and a short extension to a ratchet handle.
- Heater core cover (62).

Clean

- Original sealer from mating surfaces of exposed flanges.

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

- New sealer to cover mounting flanges.
- Heater core cover (62).
 - Guide heater core cover (62) into place, taking care to avoid scraping away any sealer from flanges.
- Heater core cover bolts/screws (61).
 - Install at least two bolts/screws (61) while holding cover in position. Tighten both bolts/screws finger tight.

- B. Install remaining bolts/screws (61) fingertight.
- C. Tighten all seven bolts/screws (61) evenly to compress flange sealer.

**Tighten**

- Bolts/screws (61) to 1.9 N.m (17 lb. in.).
- 4. Fit floor carpet in place under module (57) and against cowl panel.
- 5. Vacuum harness connectors.
 - A. Connect both connector halves.
 - B. Install assembled connectors to case.
- 6. Right hand body hinge pillar trim panel by seating retainer into front body hinge pillar.
- 7. Instrument panel support and position instrument panel to dash.
- 8. Brace (70), nut (69), and bolt/screw (68), for Chevrolet.

**Tighten**

- Nut (69) to 10 N.m (89 lb. in.).
- Bolt/Screw (68) to 1.9 N.m (17 lb. in.).
- 9. Bolts/Screws (67) for Chevrolet or bolts/screws (58) for Buick.

**Tighten**

- Bolts/screws (67) to 10 N.m (89 lb. in.).
- Bolts/screws (58) to 10 N.m (89 lb. in.).
- 10. Instrument Panel upper trim pad. Refer to SECTION 8C.
- 11. Instrument panel lower trim plate for Buick or instrument panel trim plate for Chevrolet. Refer to SECTION 8C.
- 12. Right-hand floor carpet retainer. Refer to SECTION 10-6.
- 13. Instrument panel lower reinforcement and right-hand instrument panel insulator. Refer to SECTION 8C.

Schrader® Valve Core

Tool Required:

J 22132-02 Access Valve Core Remover and Installer

A Schrader® valve core is located under the following components:

- Pressure cycling switch.
- Air conditioning refrigerant pressure sensor.
- Low side refrigerant service valve fitting.

**Remove or Disconnect**

1. Recover refrigerant. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
2. Valve cap and seal or pressure cycling switch or air conditioning refrigerant pressure sensor, refer to "Pressure Cycling Switch" or "Air Conditioning Refrigerant Pressure Sensor" in this section.

3. Valve core.

- A. J 22132-02 may be used to remove valve core.
- B. Discard valve core.

**Install or Connect**

1. New valve core and seal.
 - A. J 22132-02 may be used to install valve core.
 - B. Do not overtighten valve core.
2. Pressure cycling switch or air conditioning refrigerant pressure sensor, if removed. Refer to "Pressure Cycling Switch" or "Air Conditioning Refrigerant Pressure Sensor" in this section.

NOTICE: Valve caps must be properly tightened to prevent a refrigerant leak.

3. Valve cap and seal, if removed.
 - Tighten valve cap until the seal in valve cap is compressed against the service valve fitting.
4. Charge A/C system. Refer to "Refrigerant Recovery and Recycling, Adding Oil, Evacuating and Recharging Procedures" in this section.
5. Leak test fitting. Refer to "Leak Testing the Refrigeration System" in this section.

Vacuum Actuators**HEATER AND DEFROST VALVE VACUUM ACTUATOR****Figure 26****Remove or Disconnect**

1. Instrument panel steering column opening filler. Refer to SECTION 8C.
2. Blue and gray vacuum hoses.
 - Disconnect vacuum hose connectors at actuator (63) by sliding tabs of connector retainers past L-shaped bends in vacuum tubes. Slide connectors off tubes while continuing to hold tabs back against body of connectors.
3. Actuator (63).
 - A. With thin-blade screwdriver, disengage tab locking actuator (63) to module (57) and slide actuator (63) away to remove it.
 - B. Unhook actuator arm from the valve crank.

**Install or Connect**

1. Actuator (63).
 - A. Engage slot in actuator arm with hook of valve crank.
 - B. Slide actuator (63) into place until tab clicks to lock actuator (63) to module (57).
2. Blue and grey vacuum hoses.
 - Bend retaining tabs of vacuum hose connectors back flush against end of connectors and hold it there while slipping tabs and connectors onto vacuum tubes. When connectors are fully seated, pull retaining tabs over Lshaped bends in tubes to hold connectors in place.
3. Instrument panel steering column opening filler. Refer to SECTION 8C.

Remove or Disconnect

1. Right hand instrument panel sound insulator. Refer to SECTION 8C.
2. Vacuum hoses.
 - Disconnect tan vacuum hose connector at actuator (64) by sliding tab of connector retainer past Lshaped bend in vacuum tube. Slide connector off tube while continuing to hold tab back against body of connector.
 - Disconnect red vacuum hose connector by lifting tab off "arrow" and sliding connector off of vacuum tube.
3. Actuator (64).
 - A. With thin-blade screwdriver, disengage tab locking actuator (64) to module (57) and slide actuator (64) away to remove it.
 - B. Unhook actuator arm from valve crank.

Install or Connect

1. Actuator (64).
 - A. Engage slot in actuator arm with hook of valve crank.
 - B. Slide actuator (64) into place until tab clicks to lock actuator (64) to module (57).
2. Vacuum hoses.
 - A. Install red-coded hose to upper fitting of actuator (64) and tan-coded hose to lower fitting.

- B. To connect tan vacuum hose, bend retaining tab of hose connector back flush against end of connector and hold it there while slipping tab and connector onto vacuum tube. When connector is fully seated, pull retaining tab over L-shaped bend in tube to hold connector in place.
- C. Connect red vacuum hose by sliding connector onto tube and pulling tab over "arrow."
3. Right hand sound insulator. Refer to SECTION 8C.

AIR INLET VALVE VACUUM ACTUATOR

Figure 26

Remove or Disconnect

1. Instrument panel. Refer to SECTION 8C.
2. Orange vacuum hose.
 - Disconnect vacuum hose connector at actuator (65) by sliding tab of connector retainer past L-shaped bend in vacuum tube. Slide connector off tube while continuing to hold tab back against body of connector.
3. Actuator (65).
 - A. With thinblade screwdriver, disengage tab locking actuator (65) to module (57) and slide actuator (65) away to remove it.
 - B. Unhook actuator arm from valve crank.

Install or Connect

1. Actuator (65).
 - A. Engage slot in actuator arm with hook of air inlet valve arm.
 - B. Slide actuator (65) into place until tab clicks to lock actuator (65) to module (57).

2. Orange vacuum hose.
 - Bend retaining tab of vacuum hose connector back flush against end of connector and hold it there while slipping tab and connector onto vacuum tube. When connector is fully seated, pull retaining tab over L-shaped bend in tube to hold connector in place.
3. Instrument panel. Refer to SECTION 8C.

Vacuum Tank

Figure 26

Remove or Disconnect

1. Module. Refer to "Heater and Air Conditioning Module" in this section.
2. Vacuum hoses at tank (66).
 - Note position of both hoses for reference during installation.
3. Vacuum tank bolts/screws.
4. Tank (66).

Install or Connect

NOTICE: Refer to "Notice" on page 1B-1 of this section.

1. Tank (66).
2. Vacuum tank.

Tighten

- Bolts/screws to 1.9 N.m (17 lb. in.).
3. Vacuum hoses at tank (66).
 - Install violet hose to right of black hose.
 4. Module. Refer to "Heater and Air Conditioning Module" in this section.

MANUAL CONTROL AIR CONDITIONING

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location View in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out those fasteners that require a thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

OVERVIEW

Figures 1 and 2

The air conditioning system (C60) delivers air that has been heated or cooled and dehumidified for occupant comfort. It also provides power ventilation, and windshield and side window defrosting. During most operating conditions, outside air is drawn through the heater and air conditioning module by the blower motor. Additional outside air is also forced into the vehicle by forward movement of the vehicle.

Within the heater and air conditioning module, air is pushed by the blower motor through the evaporator, then through the heater core and into the passenger compartment. For air conditioning or defroster operation at ambient temperatures above 7° C (45° F) refrigeration system will chill the evaporator to almost freezing. As the air passes through the evaporator, the air temperature drops which causes moisture in the air to condense on the evaporator core fins. This moisture leaves the vehicle by gravity feed through a drain hole, dehumidifying the vehicle.

1B1-2 MANUAL CONTROL AIR CONDITIONING

From the evaporator, some or all of the air may pass through the heater core, which is warmed by engine coolant. Any of the air which is not to be heated will mix with the heated air before entering the passenger compartment.

When maximum air conditioning mode is selected, most of the air entering the blower motor is taken from the passenger compartment recirculated where it is most likely to be cooler than the outside air. Only outside air is used in all other modes.

HVAC CONTROL

Temperature Control

Figure 1

The temperature control is mechanically linked to the air temperature valve (door) by a temperature control cable. Rotating the temperature control clockwise allows more of the incoming or recirculated air to flow through the heater core, thus increasing the air temperature entering the vehicle. Rotating the temperature control counterclockwise decreases air flow through the heater core, thus decreasing the air temperature entering the vehicle.

Mode Control

The mode control has eight settings: "OFF," "MAX," "A/C," "B/L" (BI-LEVEL) A/C, "VENT," "HEAT," "BLEND," and "DEFROST." Each setting is described below.

"OFF" MODE

At the "OFF" setting, electrical power is not supplied to the blower motor and A/C is not requested to the powertrain control module (PCM). A small amount of air which is forced into the heater and air conditioning module by forward movement of the vehicle will still be discharged through the air outlets. This is the only mode in which the blower motor does not operate.

"MAX" A/C MODE

The "MAX" A/C setting is one of five settings which requests A/C operation to the PCM. At this setting the blower motor will operate in one of the four blower motor speed control settings and air will be discharged from the instrument panel air outlets only.

To provide maximum air conditioning, most of the air entering the heater and air conditioning module is taken from the vehicle interior (recirculated) where it is most likely cooler than the outside air. This is the only mode in which air is recirculated, all other modes use outside air only. This setting would be most useful during conditions of high temperature and humidity, or when the outside air may have an objectionable odor.

Figure 1 - Heater Ventilation and Air Conditioning HVAC Control

03-28-95
BT0011B1

Normal "A/C" MODE

The normal "A/C" setting functions the same as "MAX" A/C setting, except only outside air enters the module. There may be a slight reduction of blower noise compared to "MAX" A/C mode because the recirculation valve (door) is closed.

"B/L" (BI-LEVEL) A/C MODE

The "B/L" (BI-LEVEL) A/C setting requests A/C to the PCM and allows the blower motor to operate in one of four settings similar to "MAX" A/C, except only outside air enters the module and air is distributed through the instrument panel outlets and the floor air outlets.

"VENT" MODE

The "VENT" setting does not request A/C to the PCM but allows the blower motor to operate normally. This is one of two economy modes (other than "OFF") in which A/C is not requested. Air is discharged through the instrument panel outlets only.

"HEAT" MODE

The "HEAT" setting functions the same as the "VENT" setting, except most of the air is discharged through the floor outlets with a small amount discharged through the defroster outlets. The "HEAT" mode is the normal selection for cold weather operation unless windshield or side window defrosting is required.

"BLEND" MODE

The "BLEND" setting allows operation of the blower motor and sends an A/C request signal to the PCM for compressor operation. During this setting, air is discharged through the defroster and floor air outlets. This setting allows greater passenger comfort than "DEFROST" but is not as effective in defrosting the windshield and side windows.

"DEFROST" MODE

The "DEFROST" setting functions the same as "BLEND" setting except all air is discharged through the defroster outlets.

Blower Motor Speed Control**Figure 1**

With the ignition switch in the "RUN" position, the blower motor runs in all mode control positions except "OFF". Blower motor speed is controlled by a four-position electrical blower motor speed control switch at the left side of the HVAC control. The blower motor speed control switch provides a choice of a low blower motor speed, two medium speeds, and a high speed.

Electrical power is routed from the HVAC fuse number 17 in the instrument panel fuse block to the mode control switch. The mode control switch breaks the circuit when it is in the "OFF" position, and closes the circuit in all other positions.

From the mode control switch, the circuit then goes to the blower motor speed control switch. When the blower motor speed control switch is in "LOW," current is conducted to the resistor. At the resistor, the current passes through all three resistors and is reduced to provide the low blower motor speed.

When the blower switch is in either of the two "MEDIUM" speed positions, it closes to send current through either two or one of the resistors in the resistor assembly. Because the current follows the path of least resistance, the circuit branch leading directly to all three resistors becomes ineffective and the current bypasses either one or two resistors, depending upon which "MEDIUM" speed position is selected. The reduced resistance increases current flow and blower motor speed.

When the blower motor speed control switch is in the "HIGH" position, it energizes the high blower relay and power is taken from a separate circuit that is protected by a maxi-fuse. This separate power circuit is "hot" at all times and has the capacity to handle the current demands of the blower motor at high speed.

The circuit to the blower motor is completed to ground through the instrument panel harness at the body, just below the left side of the instrument panel. Refer to SECTION 8A for more electrical information.

AIR DISTRIBUTION SYSTEM**Figures 2 and 3**

Air enters the heater and air conditioning module where it may be cooled for air conditioning or defrost modes, and then heated as necessary before being sent to the proper outlets for discharge into the passenger compartment. Within the heater and air conditioning module, valves (doors) guide the airflow in response to the position of the mode control.

Vacuum System

All valves in the heater and air conditioning module except the temperature valve are controlled by engine vacuum drawn from the vacuum tank, mounted below and to the left of the passenger-side inflator module. The vacuum is routed by a vacuum selector valve in the HVAC control to spring-loaded vacuum actuators on the heater and air conditioning module. Vacuum stored in the vacuum tank is prevented from bleeding back to its source during conditions of low engine manifold vacuum (acceleration, hard pulling, etc.) by a check valve in the vacuum source hose.

The vacuum selector valve in the HVAC control is controlled by the mode control. For each mode control position, the vacuum selector valve directs vacuum to specific hoses to overcome the force of the springs within the appropriate vacuum actuators. The vacuum selector valve also vents the hoses to each remaining vacuum actuator to normal air pressure, allowing the actuator spring to expand. This results in the valves (doors) being properly positioned for the selected operating mode.

Figure 2 - Air Distribution System

The heater and defrost valve uses a three-position vacuum actuator. A three-position vacuum actuator has a diaphragm with a spring on both sides. At rest (no vacuum applied) the diaphragm will be in a mid-position, allowing for a "BLEND" mode. When vacuum is applied to either end of the diaphragm, the diaphragm will move the heater and defrost valve to either stop, which will direct airflow to either the defroster outlets or the floor outlets.

When air is directed to the floor outlets, as in "HEAT" mode, a small amount of air still bleeds through the defroster outlets to help eliminate re-frosting of the windshield.

Other Components

Other components of the air distribution system include the plenum, the blower motor, the evaporator, and the heater core. The plenum provides a source of outside air to the system. The blower motor draws air from the plenum or from the vehicle interior into the heater and air conditioning module and forces it through the air distribution system to the outlets.

Air Inlet Valve

The first valve in the air distribution system is the air inlet valve. This two-position valve controls the two air entrances which feed air to the blower motor. When "MAX" A/C mode is selected, vacuum is applied to the air inlet vacuum actuator and the air inlet valve opens the entrance which supplies inside air from the passenger compartment. In this position, the air inlet valve partially closes the entrance for outside air so only a slight amount can enter.

Recirculating the cooled air inside the passenger compartment when outside temperature is very high gives a faster cool down to a more comfortable temperature.

When any other operating mode (including "OFF") is selected, the air inlet vacuum actuator is vented to normal air pressure and the air inlet valve completely closes off the entrance for inside air. Only fresh outside air is used in the system in these modes.

Blower Motor and Evaporator

In any operating mode except "OFF," the blower motor draws in air from the plenum and pushes it through the evaporator. When any air conditioning or defrost mode is selected, the air conditioning refrigeration system chills the core of the evaporator to slightly above freezing temperature. This cools the airflow and causes excess humidity to condense on the fins of the evaporator. The condensed moisture drips to the bottom of the case and drains out through a hose that lets the water fall on the road surface below the vehicle. From the evaporator, the air flows toward the temperature valve and heater core.

Temperature Valve and Heater Core

The temperature control in the HVAC control is linked to the temperature valve by a flexible control cable. When the temperature control is rotated fully counterclockwise to the full "COOL" position, the temperature valve is held snugly against the air entrance to the heater core. This causes all of the airflow from the evaporator to bypass the heater core and there is no heat transfer.

Figure 3 - Air Distribution Components

1B1-6 MANUAL CONTROL AIR CONDITIONING

and defrost vacuum actuator causing the heater and defrost valve to direct all airflow to the floor outlets with a small bleed to the defroster outlets.

Ducts and Outlets

There are four adjustable high-level outlets in the instrument panel, two near the center and one at each extreme end of the panel. In addition, there are two side window defrost outlets, one at each end of the instrument panel upper trim pad. All six outlets are fed by the air distributor.

Heated or cooled air can be directed to the windshield through the windshield defroster nozzle.

Ventilation

The air distribution system provides fresh air ventilation for the passenger compartment in all operating modes. A small amount of the air circulated within the passenger compartment in the "MAX" A/C mode is taken from outside the vehicle, and all of the

air circulated in the other modes is from outside. Even in the "OFF" mode, fresh outside air is forced into the air distribution system by the forward movement of the vehicle. It then exits the pressure relief valve.

DIAGNOSIS

FUNCTIONAL TEST

The following operational test sequence will aid in determining whether the air conditioning electrical, air, vacuum and refrigeration systems are working properly. Temperature of the air should be at least 16°C (60°F). The air conditioning system cannot be properly tested unless it is at least this warm.

The engine should be started and allowed to idle until the engine cooling system thermostat is open.

Perform steps 1-9 on Chart and compare vehicle response to the normal system response shown on the chart. If vehicle does not respond correctly during any of these steps, begin diagnosis as noted below:

FUNCTIONAL TEST

HEATER VENTILATION AND AIR CONDITIONING CONTROL SETTING					SYSTEM RESPONSE				
STEP	Mode Control Lever Setting	Temperature Control Lever Setting	Blower Motor Switch	Blower Motor Speed	Heater Outlets	A/C Outlets	Defroster Outlets	Comments	Outlet Temperature
1.	Off	Cold	Low	Off	No Air Flow	No Air Flow	No Air Flow		Ambient
2.	Max/AC	Cold	Low	Low	No Air Flow	Air Flow	No Air Flow	A, E	At least 11°C (20°F) cooler than ambient
3.	Max/AC	Cold	Low to High	Low to High	No Air Flow	Air Flow	No Air Flow	B, E	At least 11°C (20°F) cooler than ambient
4.	Normal	Mid-range	High	High	No Air Flow	Air Flow	Minimum Air Flow	A	Cool to slightly warm
5.	Bi-level A/C	Cold	High	High	Air Flow	Air Flow	Minimum Air Flow	A	At least 11°C (20°F) cooler than ambient
6.	Vent	Cold	High	High	No Air Flow	Air Flow	No Air Flow	A	Ambient
7.	Heater	Hot	High	High	Air Flow	No Air Flow	Minimum Air Flow	A, C, D	At least 49°C (120°F)
8.	Blend (Defrost)	Hot	High	High	Air Flow	No Air Flow	Air Flow	A, D	At least 49°C (120°F)
9.	Defrost	Hot	High	High	Minimum Air Flow	No Air Flow	Air Flow	A, D	At least 49°C (120°F)

A. Engagement of detent must be felt in each mode control lever setting.

B. A noticeable blower motor speed increase must occur from low, medium low, medium high and high.

C. Temperature lever must travel from full cold to full hot.

D. Air flow must also be present at side window defogger outlets.

E. Instrument panel outlets must hold their position during high blower motor speed but should be moveable by hand.

T5723

- Insufficient heating. Refer to “Insufficient or No Heating” in this section.
- Insufficient cooling. Refer to “Insufficient or No Cooling” in this section.

- Improper air delivery. Refer to “Improper Air Delivery” in this section.
- Blower motor inoperative or incorrect speed. Refer to SECTION 8A.

INSUFFICIENT OR NO HEATING DIAGNOSTIC CHART

- PERFORM PRELIMINARY INSPECTION.
- MAINTAIN PROPER ENGINE OPERATING TEMPERATURE.
- DISCONNECT TEMPERATURE CONTROL CABLE AT MODULE.
- ROTATE TEMPERATURE CONTROL KNOB. INSPECT OPERATION OF KNOB AND CABLE. REPLACE IF NECESSARY.
- SET IGNITION SWITCH TO "RUN" POSITION.
- ROTATE TEMPERATURE VALVE (APPROXIMATELY 65 DEGREES) TO FULL HOT POSITION.
- SET BLOWER MOTOR SWITCH TO HI—FAN POSITION.
- IS DISCHARGED AIR TEMPERATURE AT LEAST 49°C (120°F)?

YES

- CONNECT CABLE AT MODULE.
- INSPECT FOR PROPER OPERATION.

NO

ARE THERE RESTRICTIONS
THROUGH FINS ON HEATER CORE?

YES

REPLACE HEATER CORE.

NO

REPLACE HEATER AND
AIR CONDITIONING
MODULE ASSEMBLY.

C9242

INSUFFICIENT OR NO HEATING DIAGNOSTIC CHART

INSUFFICIENT OR NO HEATING

Preliminary Inspection:

1. Check for proper engine coolant level.
2. Check engine for proper operating temperature [approximately 91° C (195° F)]. If engine does not reach 91° C (195° F), replace thermostat. Refer to SECTION 6B.
3. With engine at normal operating temperature, check heater inlet and outlet hose temperature.
 - Heater inlet hose temperature should be at or near engine operating temperature.

- Heater outlet hose temperature should be slightly cooler than the heater inlet hose.
 - If heater hose temperatures are incorrect, replace heater core.
4. Inspect plenum area (at base of windshield) for debris or anything that may cause airflow restriction.
 5. Refer to "Insufficient or No Heating" diagnostic chart.

INSUFFICIENT OR NO COOLING DIAGNOSTIC CHART

C9243

INSUFFICIENT OR NO COOLING DIAGNOSTIC CHART

INSUFFICIENT OR NO COOLING

Preliminary Inspection:

1. If A/C compressor is inoperative, refer to SECTION 6E3-C10.
2. Check to make sure instrument panel outlets are open.
3. If vehicle is not equipped with engine-driven cooling fan, check primary (left-hand) cooling fan for operation during air conditioning operation. If fan is inoperative, refer to SECTION 6E3-C12 for diagnosis.
4. Check the condenser for debris which may obstruct airflow through the fins.
5. Check the plenum area (at base of windshield) for any debris which may prevent proper airflow into the vehicle interior.
6. With air conditioning system operating, check accumulator temperature. Accumulator temperature should be near freezing (cold to touch). If this is not true, service the refrigeration system. Refer to SECTION 1B.
7. Check the air conditioning system for overcharge. If system is overcharged, recover, recycle and recharge air conditioning system. There should be 0.79 kg (1 lb. 12 ounces) of R-134a refrigerant.
8. Refer to "Insufficient or No Cooling" diagnostic chart.

1B1-10 MANUAL CONTROL AIR CONDITIONING

BS0071B1

Figure 4 - Improper Air Delivery Vacuum Diagram

IMPROPER AIR DELIVERY DIAGNOSTIC CHART

IMPROPER AIR DELIVERY DIAGNOSTIC CHART

- PERFORM PRELIMINARY INSPECTION.
- SET MODE SELECTOR VALVE IN THE "OFF" POSITION.
- DISCONNECT VACUUM LINE AT CHECK VALVE (RIGHT SIDE OF INTAKE MANIFOLD). USING A HAND VACUUM PUMP, APPLY VACUUM TO BLACK VACUUM LINE LEADING TO VACUUM TANK. DOES VACUUM HOLD?

NO

CHECK BLACK VACUUM LINE LEADING TO VACUUM TANK. IF LINE IS CONNECTED AND WORKING PROPERLY CHECK VIOLET VACUUM LINE AND VACUUM TANK FOR LEAKS BEFORE REPLACING MODE SELECTOR VALVE.

YES

- DISCONNECT VACUUM LINE MULTI-CONNECTOR AT MODE SELECTOR VALVE.
- TURN IGNITION SWITCH TO "RUN" POSITION (ENGINE NOT RUNNING).
- SELECT "HIGH" BLOWER MOTOR SPEED.
- APPLY VACUUM TO EACH VACUUM LINE INDIVIDUALLY (EXCEPT VIOLET AND ORANGE LINES) AND CHECK FOR AIR FLOW AT THE PROPER OUTLETS. REFER TO "DIAGNOSTIC AID CHART" BELOW. DOES AIR FLOW AT PROPER OUTLETS?

YES

- APPLY VACUUM TO ORANGE VACUUM LINE. DOES BLOWER MOTOR AIR FLOW NOISE INCREASE?

YES

SYSTEM OK.

NO

REPAIR OR REPLACE AIR INLET VACUUM ACTUATOR LINKAGE AND/OR AIR INLET VALVE.

NO

REPAIR OR REPLACE ACTUATOR LINKAGE AND/OR AIR VALVE (DOOR).

YES

- APPLY VACUUM TO VACUUM LINE LEADING TO MODE SELECTOR VALVE AND CHECK IN EACH SETTING ("MAX" A/C TO "DEFROST"). DOES VACUUM HOLD IN EVERY SETTING?

NO

- DISCONNECT VACUUM LINE MULTI-CONNECTOR AT MODE SELECTOR VALVE.
- APPLY VACUUM TO EACH LINE AT MULTI-CONNECTOR CONTROLLED BY THE MODE SELECTOR VALVE AT A SETTING WHERE VACUUM DID NOT HOLD. IS VACUUM LEAK PRESENT AT ONE OR MORE LINES?

YES

REPAIR OR REPLACE VACUUM LINE AND/OR VACUUM ACTUATOR.

NO

REPLACE MODE SELECTOR VALVE.

DIAGNOSTIC AID CHART

APPLY VACUUM TO:	AIR FLOW SHOULD BE DIVERTED TO:
TAN VACUUM LINE	INSTRUMENT PANEL OUTLETS ONLY
RED VACUUM LINE	WINDSHIELD, AND SIDE WINDOW DEFOGGER OUTLETS
GREY VACUUM LINE	WINDSHIELD AND SIDE WINDOW DEFOGGER, FLOOR AND INSTRUMENT PANEL OUTLETS
BLUE VACUUM LINE	FLOOR AND INSTRUMENT PANEL OUTLETS
ORANGE VACUUM LINE	BLOWER MOTOR AIR NOISE INCREASE
NO VACUUM LINES (ALL LINES VENTED TO ATMOSPHERE)	ALL OUTLETS

IMPROPER AIR DELIVERY

Figure 4

System Description

This system is operated completely by vacuum, except for the electrically powered blower motor. Engine vacuum is routed through a vacuum check valve then to the HVAC control vacuum selector valve and to the vacuum tank. The vacuum check valve is used to prevent vacuum loss due to heavy acceleration or steep uphill traveling when the engine is under a heavy load.

When vacuum is applied to a vacuum actuator, the vacuum actuator will apply sufficient force to overcome any resistance due to air flow from the blower motor and from the actuator internal spring, and move the air valve (door) to its correct position.

ON-VEHICLE SERVICE

TEMPERATURE CONTROL CABLE ADJUSTMENT

The temperature control cable cannot be adjusted. If the diagnosis determines improper operation, then the cable must be replaced.

REPLACEMENT PROCEDURES

HVAC Control and Temperature Control Cable

Figures 5 through 7

Remove or Disconnect

1. Instrument panel trim plate, I/P insulator, and I/P compartment. Refer to SECTION 8C.
2. Cable (12) at HVAC module (8).
3. Bolts/screws (34)
4. Pull HVAC control (1) away from instrument panel.
5. Electrical connectors from HVAC control (1).
6. Vacuum harness (60) from HVAC control (1).
7. HVAC control (1) with cable (12) attached.
 - Note cable routing.
8. Cable (12) from HVAC control (1).
 - Open tangs and separate cable (12).

Install or Connect

NOTICE: Refer to "Notice" on page 1B1-1 of this section.

Preliminary Inspection

1. Inspect vacuum lines at engine and vacuum check valve for proper connection.
2. Disconnect vacuum line at vacuum check valve. Start engine and check for presence of vacuum, if no vacuum is present, replace vacuum check valve.
3. Disconnect vacuum line leading to HVAC control at vacuum check valve. Apply vacuum to check valve port. If vacuum does not hold, replace vacuum check valve.
4. Make sure vacuum line multi-connector under instrument panel insulator is fully connected.
5. Refer to "Improper Air Delivery" diagnostic chart.

1. Cable (12) to HVAC control (1).
 - Align and snap cable (12) into place.
 2. Align HVAC control (1) with cable (12) attached to instrument panel.
 - Route cable properly.
 3. Vacuum harness (60) to HVAC control (1).
 4. Electrical connectors to HVAC control (1).
 5. Seat HVAC control (1) to instrument panel.
 6. Bolts/screws (34).
-  **Tighten**
- Bolts/screws (34) to 1.9 N·m (17 lb. in.).
7. Cable (12) to module (8).
 8. Instrument panel trim plate, I/P insulator, and I/P compartment. Refer to SECTION 8C.

Blower Motor Resistor and Blower Motor Relay

Figure 8

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Instrument panel insulator. Refer to SECTION 8C.
3. Resistor (39), if required.
 - A. Disconnect blower motor resistor electrical connector.
 - B. Remove three bolts/screws (78) and guide resistor (39) out of bottom of heater and air conditioning module (8).

Figure 7 - Temperature Control Cable-to-Module

4. Relay (40), if required.
 - A. Disconnect relay electrical connector.
 - B. Remove relay retaining bolt/screw and remove relay (40) from bottom of heater and air conditioning module.

Install or Connect

NOTICE: Refer to "Notice" on page 1B1-1 of this section.

1. Relay (40), if removed.
 - A. Position relay (40) to bottom of heater and air conditioning module (8) and install retaining bolt/screw.
 - B. Connect relay electrical connector.
2. Resistor (39), if removed.
 - A. Insert resistor (39) into place in bottom of heater and air conditioning module (8).
 - B. Install three bolts/screws (78).

Tighten

- Bolts/screws (78) to 1.9 N·m (17 lb. in.).
- C. Connect resistor electrical connector.
- 3. Instrument panel insulator. Refer to SECTION 8C.
- 4. Battery negative cable.

Figure 8 - Blower Motor Housing Area from Below

Air Conditioning Compressor Relay

The air conditioning compressor relay acts as an on/off switch in series in the circuit to the compressor clutch. When the powertrain control module (PCM) receives a signal indicating one or more specific operating conditions such as a wide-open throttle or excessive engine heat, the PCM opens the relay coil to open the relay contacts and to break the compressor clutch circuit.

This gives the PCM the ability to interrupt the operation of the air conditioning refrigeration system when necessary.

The relay is located inside the underhood electrical center on the right-hand front fender inner panel.

Vacuum Hose Harnesses**Figures 3 and 4**

It is not necessary to replace an entire vacuum harness in case of a localized leakage or hose collapse. A repair can be made by cutting the hose and inserting a plastic connector.

If an entire hose must be replaced, the entire HVAC module must be removed, Refer to SECTION 1B.

SPECIFICATIONS**GENERAL SPECIFICATIONS**

A/C System R-134a Capacity	0.79 kg (1 lb. 12 oz.)

ELECTRONIC CONTROL AIR CONDITIONING (C67) AUTOMATIC CONTROL AIR CONDITIONING (C68)

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR), refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Before doing any work on the A/C system, review the precautions on handling Refrigerant R134A. Also review the refrigerant recovery and recycling, adding oil, evacuating and charging procedures in HEATING AND AIR CONDITIONING (SECTION 1B).

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

DEFINITIONS (C67)

Several abbreviations and terms are commonly used throughout this section. They are presented here for reference and clarification.

- A/C - Air Conditioning.
- AIR DELIVERY MODE - Manner or place from which the air enters the passenger compartment.
- AMBIENT - What is immediately surrounding; for example, ambient air temperature is the temperature of the surrounding air.
- B + - Battery voltage.
- CCOT - Cycling Clutch Orifice Tube.
- CKT - Circuit.
- Electric Actuator - (air mix motor).

- GND - Ground.
- H-A/C Control - Heater and Air Conditioning Control.
- HVAC - Heater, Ventilation and Air Conditioning.
- IGN - Ignition.
- I/P - Instrument Panel.
- MODE VALVE - A vacuum controlled airflow-directing door that is installed in the heater, ventilation and air conditioning system.
- PCM - Powertrain Control Module.
- POT - Potentiometer.
- SIR - Supplemental Inflatable Restraint.
- TEMPERATURE VALVE - An airflow-directing device that blends heated and cooled air to obtain a desired interior temperature.

- **VACUUM ACTUATOR** - A device that when vacuum is applied to it, will move a mechanical arm. For example, a mode valve actuator.
- **VACUUM/ELECTRIC SOLENOID** - An electrical device that controls vacuum to a vacuum actuator or vacuum controlled device.

GENERAL DESCRIPTION (C67)

SYSTEM OVERVIEW

The electronic control air conditioning system is a manually select system with four blower motor speeds, eight mode setting and a "slide" type temperature lever. Although the electronic control air conditioning system is a manual select system, the vacuum actuators are used for air delivery, and the temperature valve is controlled electronically.

GENERAL OPERATION

BLOWER MOTOR SPEED SETTING

Blower motor speed is controlled by a four position switch in the H-A/C control which uses a low blower relay and blower motor resistor for all speeds except "HIGH." For "HIGH" speed operation, the H-A/C control uses a high blower relay which, when energized, sends direct battery voltage to the blower motor. For more information, refer to CHART 1C-7.

TEMPERATURE SETTINGS

Figure 1C-1

The temperature setting is adjusted using the temperature slide lever. The H-A/C control sends voltage to the electric actuator corresponding to the position of the temperature slide lever. The H-A/C control sends 0 volts or a voltage proportional to any intermediate setting. The electric actuator will then move the temperature valve to the appropriate position.

"OFF" Setting

When the off switch is activated, the blower motor will remain off, however, any air which enters as the vehicle is moving will be directed to the floor outlets. The discharge air temperature will continue to be controlled by the temperature valve.

"RECIRC" Setting

The "RECIRC" (recirculation) setting will activate the A/C setting, and also close the air inlet (recirculation) valve so most of the air entering the module is taken from the vehicle's interior.

"MIDDLE" Setting

The "MIDDLE" setting is an air delivery setting. When activated, air will be discharged through the instrument panel outlets. This setting will self-activate when either A/C or RECIRC switch is pressed.

"DEFOG" Setting

The "DEFOG" setting provides a 50/50 blend of air between the defroster outlet and the floor outlet. This setting also requests A/C to the PCM.

"FLOOR" Setting

The "FLOOR" setting, like "MIDDLE" and "BLEND," is an air delivery setting. When activated, air will be discharged through the floor outlet.

Defrost Setting

The defrost setting provides airflow to the defroster outlet with a small bleed to the floor outlets. This setting also requests A/C to the PCM.

REAR WINDOW DEFOGGER

Figure 1C-1

The rear window defogger on the C67 system operates the same as the C68 system. For information on the rear window defogger, refer to "Rear Window Defogger" under "Automatic Air Conditioning (C68)" in this section.

AIR DELIVERY SYSTEM

Figure 1C-2

Proper air delivery is achieved using a vacuum/electric solenoid which is controlled by manual input of the operator on the H-A/C control. For information and diagnostic procedures, refer to "Improper Air Delivery," CHART 1C-3.

REFRIGERATION SYSTEM

The refrigeration system functions the same as the automatic control air conditioning (C68) system. For diagnosis, refer to SECTION 1B.

IDLE SPEED CONTROL

In order to minimize the effects of compressor clutch operation on engine idle speed, the PCM is able to modify the engine idle speed during air conditioning mode operation. When the PCM receives the clutch engagement signal from the H-A/C control, in anticipation of the engine load, the PCM makes an adjustment in the idle speed before allowing the compressor to engage.

IDLE SPEED CONTROL POWER STEERING PRESSURE SWITCH

When the power steering pressure switch senses a heavy load of approximately 4827 kPa (700 psi), it sends a signal to the PCM. The PCM then de-energizes the air conditioning compressor relay to cut out use of the compressor. This will most likely happen when the operator of the vehicle makes a parking maneuver.

1C-4 AUTOMATIC CONTROL AIR CONDITIONING

Figure 1C-1 - H-A/c Control (C67)

DIAGNOSIS (C67)

OVERVIEW

The electronic control air conditioning (C67) system does not have the ability to set diagnostic trouble codes or display any system parameters. Diagnosis must begin with the "System Response Chart (C67)." Refer to Figure 1C-2.

SYSTEM RESPONSE CHART (C67)

BLANK

CHART 1C-1

INSUFFICIENT OR NO HEATING (C67)

Circuit Description:

The H-A/C control sends a voltage through CKT 1199 corresponding to the position of the temperature slide lever. The H-A/C sends 0 volts in the extreme cold position, 12 volts in the extreme hot position or a voltage proportional to any intermediate setting. The electric actuator has an internal potentiometer in it. Using internal feedback from the "POT," the electric actuator can move the temperature valve to its command.

Diagnostic Aids:

1. Check for proper engine coolant level.
2. Check engine for proper operating temperature (approximately 91°C (195°F)). If engine does not reach 91°C (195°F), replace thermostat.
3. With engine at normal operating temperature, check heater inlet and outlet hose temperature.
 - Heater inlet hose temperature should be at or near engine operating temperature.
 - Heater outlet hose temperature should be slightly cooler than the heater inlet hose.
 - If heater hose temperatures are incorrect, replace heater core.
4. Inspect plenum area (at base of windshield) for debris or anything that may cause airflow restriction.

CHART 1C-1 **INSUFFICIENT OR NO** **HEATING (C67)**

- PERFORM PRELIMINARY INSPECTION FIRST.
 - REMOVE RIGHT HAND TRIM PANEL.
 - OPEN GLOVE BOX PAST STOPS.
 - WITH IGNITION IN THE "RUN" POSITION, SLOWLY MOVE TEMPERATURE SLIDE FROM FULL HOT TO FULL COLD AND BACK TO FULL HOT.
- DOES ELECTRIC ACTUATOR DRIVE SHAFT ROTATE WHILE TEMPERATURE SLIDE IS MOVED?

YES

- REMOVE ELECTRIC ACTUATOR.
 - WITH ENGINE RUNNING AT NORMAL OPERATING TEMPERATURE, MANUALLY ROTATE TEMPERATURE VALVE SHAFT (ABOUT 65°) FROM STOP TO STOP.
- DOES TEMPERATURE VALVE SEAT IN BOTH DIRECTIONS WITH DISCHARGED AIR TEMPERATURE CHANGING FROM ABOUT AMBIENT TO AT LEAST 49°C (120°F).

YES

- REINSTALL ELECTRIC ACTUATOR WITH TEMPERATURE SLIDE LEVER IN THE FULL HOT POSITION.
- IS DISCHARGED AIR TEMPERATURE AT LEAST 60°C (140°F)?

YES

NO TROUBLE FOUND.

NO

REPLACE H-A/C MODULE.

NO

- DISCONNECT ELECTRIC ACTUATOR ELECTRICAL CONN.
 - WITH IGNITION IN THE "RUN" POSITION USING A DVM, CHECK FOR B+ AT TERM "10."
- IS B+ PRESENT AT TERM "10"?

YES

- CHECK TERM "7" FOR GROUND.
- IS GROUND PRESENT?

YES

- USING A DVM, MONITOR VOLTAGE AT TERM "8" WHILE MOVING TEMPERATURE SLIDE LEVER FROM FULL HOT TO FULL COLD.
- DOES VOLTAGE CHANGE FROM 12V TO 0V?

YES

REPLACE ELECTRIC ACTUATOR.

NO

REPAIR OPEN IN CKT 241 BETWEEN TERM "10" AND S211.

NO

REPAIR OPEN IN CKT 450 BETWEEN TERM "7" AND S201.

NO

- CHECK FOR AN OPEN OR SHORT TO GROUND IN CKT 1199.
- IF OK, REPLACE H-A/C CONTROL.

CHART 1C-2

INSUFFICIENT OR NO COOLING (C67)

Circuit Description:

The H-A/C control sends a voltage through CKT 1199 corresponding to the position of the temperature slide lever. The H-A/C sends 0 volts in the extreme cold position, 12 volts in the extreme hot position or a voltage proportional to any intermediate setting. The electric actuator has an internal potentiometer in it. Using internal feedback from the "POT," the electric actuator can move the temperature valve to its command.

Diagnostic Aids:

1. Check to make sure instrument panel outlets are open by sliding levers to the left.
2. If vehicle is not equipped with engine driven cooling fan, check primary (right-hand) cooling fan for operation during air conditioning operation. If fan is inoperative, refer to SECTION 6E3-C12 for diagnosis.
3. Check the condenser for debris which may obstruct airflow through the fins.
4. Check the plenum area (at base of windshield) for any debris which may prevent proper airflow into the vehicle interior.
5. With air conditioning system operating, check accumulator temperature. Accumulator temperature should be near freezing (cold to touch). If this is not true, service the refrigeration system. Refer to SECTION 1B and "Refrigerant System Check," CHART 1C-6 in this section.
6. Check the air conditioning system for overcharge. If system is overcharged, recover, recycle, and recharge air conditioning system. There should be 0.8 kg (1 pound 12 ounces) of R-134a refrigerant.

CHART 1C-3 IMPROPER AIR DELIVERY (C67)

Circuit Description:

Air Delivery

With the ignition switch in "RUN," voltage is applied through I/P fuse #20 to the H-A/C control. The operating mode of the system is determined by buttons on the front panel. Ground signals determine which air valves are to be operated as well as the position of the temperature valve.

The vacuum/electric solenoid contains the solenoid valves that control the vacuum actuators. When the solenoids are de-energized, the valves vent the vacuum actuators, allowing the vacuum actuator to return to the vent position.

Air Delivery

H-A/C Control

With the ignition switch in "RUN," voltage is applied through I/P fuse #20 to the H-A/C control. The operating mode of the system is determined by buttons on the front panel. Ground signals determine which air valves are to be operated as well as the position of the temperature valve.

Vacuum/Electric Solenoid

The vacuum/electric solenoid contains the solenoid valves that control the vacuum actuators. When the solenoids are de-energized, the valves vent the vacuum actuators, allowing the vacuum actuator to return to the vent position.

Recirculation Valve

The recirculation valve closes off most of the outside air inlet, so that the air from the inside of the vehicle is re-circulated through the A/C system for maximum cooling. The outside air inlet is partially closed when vacuum is applied to the actuator. When the air inlet valve actuator is vented, the recirculation valves close off the in-car air inlet which allows outside air to be drawn into the vehicle.

Temperature Valve

The temperature valve determines how much air flows through the heater core, which determines the temperature of the air to the outlets. It is moved by the temperature valve electric actuator. The position of the valve is determined by the temperature selected at the H-A/C control.

DEF/Heater

The DEF/heater valve determines whether air flow will be directed to the windshield defrost outlets. With vacuum applied to the gray hose at the defroster valve actuator, the valve is positioned to allow air flow to the windshield defrost outlets, with some bleed to the heater outlet.

Upper/Lower Mode

The upper/lower mode valve can assume three positions and is operated by a bi-directional vacuum port which can move the valve to either of two positions. If no vacuum is applied to either vacuum port, the valve is in mid-position. Air flow with the valve in mid-position will be delivered to the panel outlets and the floor outlets (Bi-Level). When the

upper/lower solenoid (#3) (tan vacuum hose) is operated, the valve is positioned to direct air flow to the A/C outlets. When the upper/lower solenoid (#4) (red vacuum hose) is operated, the valve is positioned to direct air flow to the heater outlets and defroster outlets.

Diagnostic Aids:

1. Make sure that ground G200 is clean and tight.
2. Check I/P fuse 20. If open, check for a short to ground in CKT 241.
3. Check for normal operation of engine vacuum check valve.

With engine warm and running in idle:

4. Check manifold vacuum at the violet hose from the vacuum tank to the electric solenoid.
5. Check for vacuum at the violet hose from the vacuum tank to the electric solenoid.
6. Check that the vacuum hoses from the electric solenoid to the vacuum actuators are connected and in good condition.
7. Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity/voltage check. Refer to SECTION 8A.
8. Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems. Refer to SECTION 8A.

Vacuum Diagnosis

1. Check vacuum supply to vacuum/electric solenoid (black vacuum hose) while engine is running.
 - Vacuum should be approximately 38 to 43 cm Hg (15 to 16 inch Hg) with engine running.
 - Vacuum should remain at approximately 38 to 43 cm Hg (15 to 16 inch Hg) when engine is turned off.
2. Test each vacuum actuator by disconnecting the vacuum hose and applying vacuum directly to the actuator. Repair or replace as necessary.
3. Reconnect all vacuum and electrical connections. Run engine and cycle through the operating modes and full temperature range of the H-A/C control while observing the vacuum actuators.
 - Check for vacuum to the vacuum actuators by noting vacuum actuator position. When vacuum is applied, the actuator will retract refer to the top of page 1C-14.
 - If a vacuum actuator retracts when it should not, replace the H-A/C control, after performing the diagnostics on page 1C-16.
 - If a vacuum actuator does not retract when it should, check for vacuum leaks, collapsed vacuum hoses, binding valves or bad connections at the vacuum/electric solenoid. If OK, replace the vacuum/electric solenoid.

(CONTINUED ON NEXT PAGE)

CHART 1C-3 **(Page 2 of 2)** **IMPROPER AIR DELIVERY** **(C67)**

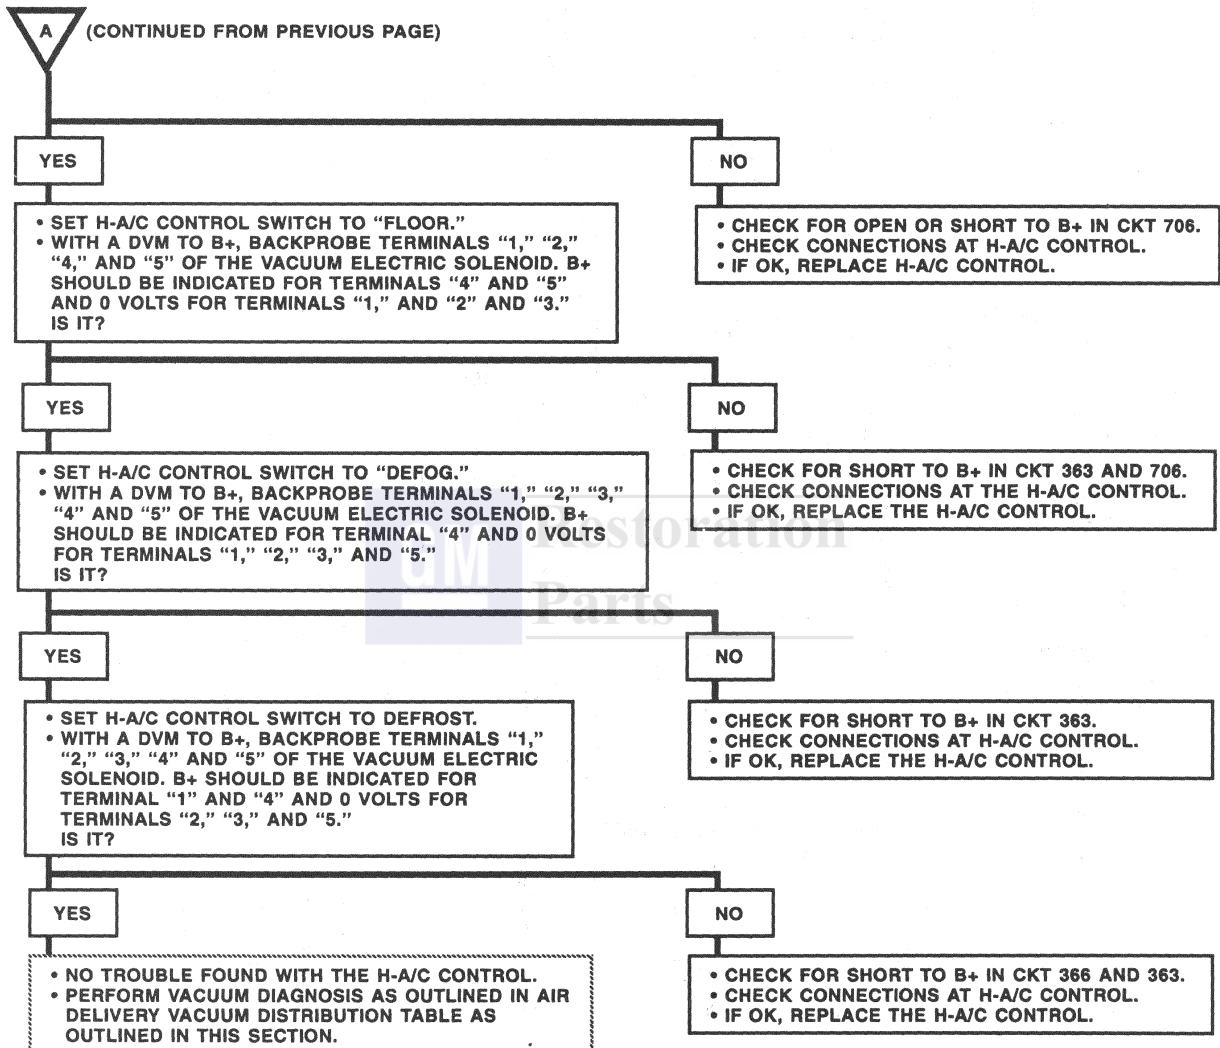

Figure 1C-5-Blower Control Schematic (C67)

Circuit Description:

The blower motor is a variable speed motor, which runs at a speed proportional to the applied voltage. The higher the voltage applied to the motor, the faster the speed.

While the ignition switch is in the "Run" position, battery voltage is applied to the H-A/C control through fuse #17. With the H-A/C control in the "OFF" position, no voltage is supplied to the blower motor.

When any other mode position is selected, voltage is applied to the H-A/C control blower switch and blower motor resistor, if not in "HI."

With the H-A/C control "ON," the low blower relay contacts will be closed, current will flow through CKT 60 to S264 through CKT 60 to terminal "A" of the blower motor resistor.

As the H-A/C control blower switch is moved through positions "M1" and "M2", the switch bypasses part of the blower resistor allowing more voltage to be applied to the blower motor, which will increase its speed.

When the H-A/C control blower switch is in the "HI" position, voltage is applied through CKT 52 to the coil of the high blower relay. The high blower relay energizes, removing the blower resistor from the circuit. Battery voltage is then applied directly to the blower motor through the high blower relay contacts. The motor runs at maximum speed.

Diagnostic Aids:

1. Check I/P fuse 17. If open, check for a short to ground in CKT 641.
2. Check Underhood maxifuse 10 for open. If open, check for short to ground through CKT 42.
3. Check G200 by noting normal operation of the underhood lamp or license lamp.
4. If blower motor is "ON" with ignition switch in "OFF," check for short to B+ on CKT 60, CKT 52, CKT 63, CKT 64, CKT 65, CKT 72 and CKT 101. If OK, replace high blower relay.
5. If blower motor is "ON" at all times with ignition switch in "RUN" and H-A/C selector switch is "OFF," check for short to ignition voltage on CKT 60, CKT 52, CKT 63, CKT 64, CKT 65, CKT 72 and CKT 101. If OK, replace H-A/C selector switch.
6. Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity/voltage check. Refer to SECTION 8A.
7. Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems. Refer to SECTION 8A.

DEFINITIONS (C68)

Several abbreviations and terms are commonly used throughout this section. They are presented here for reference and clarification.

- ACAC - Automatic Control Air Conditioning.
- A/C - Air Conditioning.
- AIR DELIVERY MODE - Manner or place from which the air enters the passenger compartment.
- AMBIENT - What is immediately surrounding; for example, ambient air temperature is the temperature of the surrounding air.
- B + - Battery voltage.
- CCOT - Cycling Clutch Orifice Tube.
- CKT - Circuit.
- DLC - Data Link Connector.
- DTC - Diagnostic Trouble Code.
- Electric Actuator - (air mix motor).
- GND - Ground.
- H-A/C Control - Heater and Air Conditioning Control.
- HVAC - Heater, Ventilation and Air Conditioning.
- IGN - Ignition.
- I/P - Instrument Panel.
- MODE VALVE - A vacuum controlled airflow-directing door that is installed in the heater, ventilation and air conditioning system.
- PCM - Powertrain Control Module.
- POT - Potentiometer.
- PROGRAM NUMBER - A number calculated by the H-A/C control microprocessor, based on various inputs, that relates to the amount of heating and cooling required to maintain the set temperature. A program number of 0 indicates full cooling and 255 indicates full heating.
- RAM - Random Access Memory.
- SET TEMPERATURE - The desired interior temperature chosen by the operator.
- SDL - Serial Data Link.
- SIR - Supplemental Inflatable Restraint.
- TEMPERATURE VALVE - An airflow-directing device that blends heated and cooled air to obtain a desired interior temperature.
- THERMISTOR - An electrical device that changes resistance as temperature changes. When temperature increases, resistance decreases and when temperature decreases resistance increases.
- VACUUM ACTUATOR - A device that when vacuum is applied to it, will move a mechanical arm. For example, a mode valve actuator.
- VACUUM/ELECTRIC SOLENOID - An electrical device that controls vacuum to a vacuum actuator or vacuum controlled device.
- VF - Vacuum Fluorescent.

GENERAL DESCRIPTION (C68)

SYSTEM OVERVIEW

The automatic control air conditioning system can be used as a fully automatic interior climate control system, or as a partially automatic system that provides manual control of blower motor speed, compressor operation and/or air mode selection while temperature continues to be controlled automatically.

The main components that comprise this system are the heater and air conditioning control, powertrain control module (PCM), blower motor control module, air temperature sensors, heater and air conditioning evaporator module, and the refrigeration system.

The automatic control air conditioning system is more easily understood if it is divided into four categories. These are:

1. General Operation
2. Air Delivery System
3. Refrigeration System
4. Temperature Control System

In order to fully understand the automatic control air conditioning system you should first have a thorough understanding of the general operation, air delivery refrigeration system and temperature control system. If necessary, refer to SECTION 1B.

GENERAL OPERATION (C68)

BLOWER MOTOR CONTROL

Blower motor speed is controlled through a blower motor control module. The blower motor control module receives blower motor speed input from the H-A/C control. Power is supplied from a 30 ampere fuse (H-A/C MOD I/P fuse 40) in the fuse block and a "hot at all times" circuit that serves only the blower motor control module. For fuse location, refer to ELECTRICAL DIAGNOSIS 8A-11.

The blower motor control module will either transmit the full voltage of the circuit to the blower motor for high speed operation, or it will electronically reduce the voltage to provide a variable blower motor speed in automatic operation. For full manual blower motor control, two blower motor speeds are provided, high and low. For automatic control, three settings are provided; auto low, auto and auto high.

A branch circuit from the power feed line to the blower motor brings a voltage signal to the heater and air conditioning control. This provides the H-A/C control with feedback input on the actual blower motor speed.

When heating is required, blower motor operation after start-up will be delayed until engine coolant had reached a temperature adequate to provide heat unless defrost operation or blower motor speed is manually selected.

TEMPERATURE SETTINGS

Figure 1C-6

The various temperature settings work much the same way as a house thermostat. Settings are spaced out between 18°C (65°F) and 29°C (85°F). To change temperature settings, press the "TEMP" up or "TEMP" down switch until the desired temperature setting is displayed. Touching the same switch a second time after reaching the extreme will cause the setting to jump down to 16°C (60°F) or up to 32°C (90°F) and the system will deliver either maximum cooling or maximum heating, as appropriate. This selected temperature will continue until another temperature setting is selected. Air conditioning cannot occur if the mode selected is "OFF" or "VENT," as in these settings the compressor will not run.

"OFF" Setting

The "EXT TEMP" graphic will be displayed. With this setting selected the system will not let the blower motor or compressor run. The system will, however, still try to reach the set temperature. For example, if 21°C (70°F) is selected and it is a cold day, the vehicle may eventually reach the 21°C (70°F) range, but over a long period of time due to the blower motor not running. If it is a hot day, it can only cool the vehicle to around outside (ambient) air temperature since in this mode, the blower motor and compressor will not run. In this selection all air coming out of the evaporator module will be diverted to the floor outlets.

"VENT" Setting

This switch provides an input to the H-A/C control, which controls the A/C compressor. Touching the "VENT" switch will interrupt the A/C request signal to the PCM. This prevents the added fuel consumption caused by the power drag of compressor operation. When operating in this mode, the H-A/C control graphic display will light "VENT" and the set temperature. Touching the "VENT" switch again will allow compressor operation.

While in the "VENT" mode, the system performs in the same manner as in "AUTO," with the exception that the A/C compressor is not enabled. When the "VENT" button is pushed, the set temp will be displayed for five seconds.

"AUTO" Setting

This switch, when touched, provides fully automatic operation. The compressor circuit is energized, providing all criteria is met, as described in SECTION 6E3-C-10, and temperature is controlled automatically to deliver air at the desired temperature setting. The air distribution mode and the speed of the blower motor will adjust to provide optimum interior comfort. The graphic display will show "AUTO" along with the set temperature (for five seconds) when automatic operation is selected.

In this mode, the system has the capability of any blower motor speed, any air inlet position, and any air outlet position to reach and maintain the set temperature. Depending on the heating or cooling requirements, most of the air will enter the passenger compartment from one or a combination of the

- A "AUTO" SWITCH
- B "TEMP" SWITCH
- C GRAPHIC DISPLAY
- D "FAN" (BLOWER MOTOR) SWITCH
- E "MIDDLE" SWITCH
- F "BLEND" SWITCH
- G "FLOOR" SWITCH
- H "DEFOG" SWITCH
- J REAR WINDOW DEFOGGER SWITCH
- K DEFROST SWITCH
- L "OFF" SWITCH
- M "VENT" SWITCH
- 16 H-A/C CONTROL

Figure 1C-6 - H-A/C Control (C68)

following four positions:

1. Out the floor outlets.
2. Out the instrument panel outlets.
3. Out the defroster outlet.
4. Defroster and floor outlets.

Defrost Setting

Touching this switch will direct most of the air to the windshield and some air to the heater outlet. The blower motor will be controlled automatically with no delay. The compressor will run whenever defrost is selected. Unless the low pressure cycling switch is open [below 165 kPa (24 psi)] or outside air temperature is below 2°C (35°F). This provides a dehumidifying effect that helps to remove frost faster. After start-up, the blower motor speed can be reduced by touching the FAN down switch. The set temp will display for five seconds.

"DEFOG" Setting

This switch, when touched, will provide a 50/50 air delivery blend between the defroster outlet and the floor outlets. During this setting, the blower motor will also be controlled automatically with no delay. The compressor will also be controlled automatically. This setting provides greater passenger comfort than defrost, but is not as effective in defrosting the windshield. The set temp will display for five seconds.

MANUAL MODE

If the "MIDDLE," "BLEND," "FLOOR" or "DEFOG" button is pushed, the automatic control air conditioning system will revert to manual operation until "AUTO" is pushed again. If the fan switch is

pushed at anytime, the blower control will also be in manual mode. Pushing "AUTO" or defrost will put the blower control back in "AUTO" mode.

AIR DELIVERY SYSTEM

Figure 1C-7

The heater and air conditioning evaporator module incorporates most of the air conditioning components into one assembly. The function of the air delivery system is to distribute air flow through the vehicle. The major components are the air inlet valve, blower motor, evaporator, temperature valve, heater core, defroster valve, and the mode valve. For a description of operation, along with diagnostics and repair procedures, refer to CHART 1C-3 "Improper Air Delivery," in this section.

REFRIGERATION SYSTEM

The sole function of the refrigeration system is to maintain the evaporator temperature near freezing when air conditioning is requested. The major components, interconnected by hose and tube, that accomplish this are the A/C compressor, the condenser, the expansion (orifice) tube, the evaporator and the accumulators. For diagnosis, refer to "Chart 6: Refrigerant System Check," in this section. The location of the components and a description of operation, along with repair procedures and further diagnostics, are found in SECTION 1B.

5-24-94
BS0071C

Figure 1C-7 - Heater and Air Conditioning Evaporator Module Assembly

TEMPERATURE CONTROL SYSTEM

The temperature control system is dependent upon the interaction of many electronic components. In the following paragraphs the location of these components, as well as a brief description of operation, are given.

CONTROL SYSTEM COMPONENTS

Heater and Air Conditioning Control (H-A/C Control)

The H-A/C control accomplishes automatic temperature control via a microprocessor that accepts input from momentary contact push buttons and external sensors to provide customer temperature control, as needed.

The H-A/C control will send signals to the electric actuator (air mix motor), vacuum/electric solenoid and blower motor control module. The H-A/C control will also display DTCs and ACAC data when used in diagnosing an ACAC complaint.

Powertrain Control Module (PCM)

The PCM contains a microprocessor that receives diagnostic mode and air conditioning requests from the H-A/C control. The H-A/C control receives engine coolant temperature, vehicle speed, engine rpm, air conditioning clutch status, and PCM system diagnostic trouble codes from the PCM. For additional information, refer to SECTION 6E3.

Sensor Inputs

Three sensor inputs are monitored by the H-A/C control to control the climate control system. Two temperature values and one sun load value are sent to the H-A/C control via thermistors and a reverse bias photo diode. Each of these sensors is described below.

Inside (In-Car) Air Temperature Sensor

The inside air temperature sensor is a thermistor. It is mounted at the top of the instrument panel, just above the instrument panel compartment. The sensor fits within a short horizontal tube connected to an aspirator on the evaporator module. Airflow from the blower motor tends to draw a continual stream of air through the aspirator and the sensor. This forced flow of inside air over the thermistor provides a constantly updated inside air temperature signal to the H-A/C control.

Resistance of the inside air temperature sensor thermistor varies from 100,701 ohms at -40°C (-40°F) to 282 ohms at 85°C (185°F). The H-A/C control supplies a 5-volt reference voltage to the thermistor and measures the voltage drop in the circuit to tell whether the mode, blower motor speed, or the temperature valve position must be changed. Refer to "Temperature Valve Position" in this section.

Outside Air Temperature Sensor

The outside air temperature sensor is mounted to the radiator center support, just below the hood latch. In this position, it is exposed to airflow through the grille before the air enters the radiator. This provides a sample of outside (ambient) air temperature.

Resistance of the sensor varies from 100,701 ohms at -40°C (-40°F) to 667 ohms at 60°C (140°F). The H-A/C control supplies a constant 5 volt reference voltage to the thermistor and measures the voltage drop in circuit to obtain a temperature signal.

This signal is an input that tells the H-A/C control how much cooling or heating will be required to deliver air at the desired temperature to the passenger compartment. It also affects the mode and blower motor speed.

Sun Load Temperature Sensor

The sun load sensor is in the left side of the windshield defroster nozzle grille in the instrument panel upper trim pad, close to the windshield. The sensor is a reverse bias photo diode - a dome type sensor that responds to varying degrees of sunlight by permitting more or less of the 5-volt reference voltage to flow through the circuit. The effect of the sensor in bright sunlight is as if the temperature setting was lowered by as much as 3 degrees.

Blower Motor Control Module

The blower motor control module controls the operation of the blower motor, and is attached to the bottom of the evaporator module, just to the left of the blower motor. Two multi-connectors from the body wiring harness are connected to terminals on the bottom of the blower motor control module. The blower motor control module receives blower drive signals from the H-A/C control which are amplified into strong output signals proportional to the input. The blower motor control module is transistorized and it provides variable blower motor speeds. A large heat sink, attached to the blower motor control module, protrudes into the evaporator air stream as a means of dissipating the heat which the blower motor control module generates. Commanded blower motor speed can be monitored under pointer number "-07." Refer to "Diagnostic Parameters" in this section.

Rear Window Defogger

Figure 1C-6

The rear window defogger is energized by pressing the defogger switch. Current flows from the rear defogger circuit breaker through the rear defogger relay to the rear window. Electrically conductive horizontal grid lines are bonded to the inside of the rear window. When the grid lines are subjected to current flow, the rear window is heated and the surface is defogged. The outside rearview mirrors (if equipped) are defogged at the same time.

When the defogger switch is pressed, a signal is sent to the H-A/C control. The H-A/C control grounds the rear defogger relay to allow current to flow. The H-A/C control will de-energize the relay after ten minutes. Additional five minute periods of heating can be obtained each time the switch is pressed until a new ignition cycle occurs. The defogger can be manually shut off at anytime during its operating cycle by pressing the defogger switch or turning off the

ignition. The small defogger symbol will appear near the lower right corner of the graphic display area when the rear window defogger is operating.

CLIMATE CONTROL FEATURES

Program Number

The program number is a number calculated by the H-A/C control to express the amount of heating and cooling required to meet the desired inside temperature. This number is based upon the following variables:

- Set temperature.
- Outside temperature.
- Inside temperature.
- Sun load.

The calculated program number is used to determine the proper air delivery mode and blower motor speed, and is a factor in determining the temperature valve position. A program number of 0 represents maximum system cooling and 255 represents maximum system heating. As the inside temperature nears the set temperature, the program number changes to maintain the set temperature.

The program number can be observed while in the diagnostic model, refer to "ACAC Diagnostic System Check" in this section. A self-diagnostic feature allows the service technician to manually override the calculation of the program number to observe system operation throughout the working range.

Temperature Valve Position (Mix Door)

The proper temperature valve position is determined by the H-A/C control. In order to provide the proper mix of warm and cool air, the H-A/C control monitors the program number.

When inputs indicate a need to move the temperature valve, the H-A/C control sends a voltage signal to the electrical actuator motor of the temperature valve on the evaporator module. The motor is a reversible drive motor. Temperature valve movement is commanded through CKT 1199 from the H-A/C Control (PIN C7) to the actuator (PIN 6). Zero volts means move to hot position, 2.5 volts mean stop and 5 volts mean move to cold (all reading ± 0.5 volts). In this manner, the H-A/C control moves the temperature valve to its proper position.

A feedback potentiometer (a variable rheostat) built into the electric actuator motor monitors the temperature valve and sends a reference signal corresponding to the position of the valve. This signal is transmitted to the H-A/C control indicating the present position of the valve. From this input, the H-A/C control determines exactly where to stop moving the valve. Commanded Temperature Valve Position can be seen at pointer -25. Actual can be seen at pointer -20. This signal is in A/D counts. 5 A/D counts means maximum heating. 255 A/D counts means maximum cooling.

Air Delivery Mode Control

The various temperature settings discussed under "Temperature Settings" in this section are used in order to provide comfortable heating or cooling. The H-A/C control will direct the blended air in one of several air delivery modes. The air is directed to the outlets by commanding the vacuum/electric solenoid to energize specific vacuum actuators controlling the appropriate combination of valves. The H-A/C control determines the proper air delivery mode based upon the current program number, set temperature and selected mode. Air delivery mode can be observed in pointer number "-27". Refer to "Diagnostic Pointers and Parameters" in this section.

In addition, the H-A/C control will remember the last previous temperature setting (and the blower motor speed setting if operating in "AUTO") and display the same setting the next time the ignition is turned "ON."

The vacuum/electric solenoid is attached to a vacuum manifold that is supplied by a hose from the vacuum tank on the top of the heater and air conditioning evaporator module. In the vacuum/electric solenoid, five individual solenoids each control a vacuum valve within the solenoid. When its solenoid is energized, each valve feeds vacuum to a hose leading to its associated vacuum actuator. When its solenoid is de-energized, the valve vents the hose to normal air pressure.

Off Mode

When the "OFF" switch is activated the blower motor will remain off, however, any air which enters as the vehicle is moving will be directed to the floor outlets. The discharge air temperature will continue to be controlled by the temperature valve.

Recirculation Mode (RECIRC) Mode

When in this mode, air is delivered to the instrument panel outlets and the air inlet valve closes to force interior air to recirculate through the evaporator for maximum cooling.

Air Conditioning Mode (MIDDLE)

Air inlet valve is open to provide outside air to the instrument panel outlets.

Bi-Level Mode (BLEND)

Provides outside air to floor outlet with a bleed to defroster outlet.

Heat Mode (FLOOR)

Provides outside air to floor outlet with a bleed to defroster outlet.

Defog Mode

Air will be split equally between the defroster and heater outlets.

Defrost Mode

Provides outside air to defroster outlet with a bleed to floor outlets.

Delay Mode

A delay mode is needed for cool climates in which the vehicle will be going through a cold start. During a cold weather start, warm moisture from the breath of the vehicle occupant(s) may condense as a fog on the windshield. When conditions are likely to cause this problem, a delay mode program sets the air valves to deliver airflow to the windshield through the defroster outlet. With the "AUTO" switch set for automatic operation, a low blower speed is automatically selected to minimize windshield frost or fogging. When engine temperature reaches 35°C (95°F) or within 3 minutes, whichever comes first, the automatic control air conditioning system will revert to its normal operating mode.

Purge Mode (Cold Purge)

During a start in cool weather with a still warm engine, the humid air which collects around the heater core inside the evaporator module could cause windshield fogging. To prevent this, a purge routine is programmed into the H-A/C control. With coolant temperature at least 16°C (60°F) and the blower motor and air distribution in the "AUTO" mode, the air valves will move to guide the airflow away from the windshield. During the first 5 seconds, while the air valves are moving into position, the blower motor will not run. Then for the next 15 seconds, a low blower motor speed purges the moist air from the system. After that, the system goes to the normal operating mode.

AIR CONDITIONING PURGE MODE

During a start in warm weather, warm moist air can accumulate around the evaporator (from previous air conditioning operation and heat soak from the sun). To divert this undesirable air from the driver's face, the H-A/C control will disable the blower motor for five seconds while the mode valves position to divert the air to the floor outlets. After positioning the mode valves, the heater and air conditioning control will set the blower motor on low for 10 seconds to "purge" the air from the module before returning to "AUTO" mode.

COMPRESSOR CLUTCH CONTROL

The H-A/C control will request the air conditioning compressor clutch to be enabled for all modes when "AUTO," "DEFOG" or "DEFROST" is selected. For ambient temperatures above 2°C (35°F), the H-A/C control will request the compressor clutch to be enabled. For ambient temperatures below 2°C (35°F), the H-A/C control will not request the compressor clutch to be enabled. Once it has been determined that this condition exists, the ambient temperature must rise above 4°C (40°F) in order for the H-A/C control to request the compressor clutch to be enabled. When the system is in the "OFF" or "VENT" mode, the H-A/C control will not request the clutch to be enabled.

IDLE SPEED CONTROL

In order to minimize the effects of compressor clutch operation on engine idle speed, the PCM is able to modify the engine idle speed during air

conditioning mode operation. When the PCM receives the clutch engagement signal from the H-A/C control, in anticipation of the engine load, the PCM makes an adjustment in the idle speed before allowing the compressor to engage.

IDLE SPEED CONTROL POWER STEERING PRESSURE SWITCH

When the power steering pressure switch senses a heavy load of approximately 4827 kPa (700 psi), it sends a signal to the PCM. The PCM de-energizes the air conditioning compressor relay to cut out use of the compressor. This will most likely happen when the operator of the vehicle makes a parking maneuver.

DIAGNOSIS**OVERVIEW**

To diagnose the climate control system in the shortest time, it is important to know how a properly functioning system will perform.

**Important**

- Diagnosis of all climate control functions must begin with the "ACAC System Check." in this section. This quick test can save time and lead to the correct diagnosis procedure to repair the problem.

ACAC DIAGNOSTIC SYSTEM CHECK

Figures 1C-8, 1C-9, and 1C-12

If the ACAC system detects an error within the HVAC system, a current and history diagnostic trouble code (DTC) will be set. Once the failure is no longer detected, the DTC will be stored only as history trouble code. A two-digit code is a current DTC and the same two-digit code preceded by a "1" is a history DTC. History codes will be stored for 199 ignition cycles. When the counter gets to 199, all history trouble codes will be cleared and the counter will be set back to zero. There will not be any indication to the operator that a failure has been detected or that a current or history trouble code is stored in the H-A/C control memory unless the self-diagnostic mode is entered.

If an HVAC DTC is set, the H-A/C control will use a "default value" until the DTC has been cleared or repaired. To enter the "ACAC Diagnostic System Check," press the "TEMP" up switch and the "OFF" switch on the control panel at the same time. Upon entry, a segment check will be performed and then the graphic display will show pointer number "-00". If the compressor clutch is being requested, the "EXT TEMP" graphics will be displayed. The fan up and fan down switch can be used to increase and decrease the pointer number. The "MIDDLE" switch can be used to change from pointer number -02 to DTC or parameter values for pointers "05-31."

ACAC SYSTEM CHECK

! IMPORTANT:

- IF YOU HAVE NOT REVIEWED THE BASIC INFORMATION ON HOW TO USE THE COMPUTER SELF-DIAGNOSTICS, REFER TO "ON-BOARD DIAGNOSTIC SYSTEM CHECK" IN THIS SECTION.

- TURN IGNITION TO "RUN" AND ENTER DIAGNOSTICS.
- ARE ANY HVAC DIAGNOSTIC TROUBLE CODES (DTC) DISPLAYED?
(IF H-A/C CONTROL DISPLAY IS BLANK, REFER TO "CHART 8; INOPERATIVE H-A/C CONTROL" IN THIS SECTION.)

NO DTC DISPLAYED.

- DTC DISPLAYED.
- REFER TO "DIAGNOSTIC TROUBLE CODES (DTC)" IN THIS SECTION.

H-A/C CONTROL OPERATIVE BUT WILL NOT ENTER DIAGNOSTICS.

REPLACE H-A/C CONTROL.

- EXIT DIAGNOSTICS.
- START ENGINE.
- SELECT 16°C (60°F) AND "HI" BLOWER MOTOR ASSEMBLY SPEED.
- AMBIENT TEMPERATURE MUST BE ABOVE 10°C (50°F).
- DO BLOWER MOTOR AND COMPRESSOR OPERATE?

BOTH BLOWER MOTOR AND COMPRESSOR OPERATE.

NO COMPRESSOR OPERATION.

BLOWER MOTOR DOES NOT OPERATE.

BOTH BLOWER MOTOR AND COMPRESSOR DO NOT OPERATE.

INSTALL GAGE SET IS A/C LOW SIDE PRESSURE ABOVE 55 psi?

REFER TO CHART 1 IN THIS SECTION.

REFER TO CHART 1 IN THIS SECTION AND SECTION 6E3-C10.

YES

NO

REFER TO SECTION 6E3-C10.

LEAK CHECK A/C SYSTEM. REFER TO SECTION 1B.

• IF COMPLAINT IS:

- | | |
|--|-----------------|
| - IMPROPER AIR DELIVERY | SEE CHART 1C-3. |
| - INSUFFICIENT OR NOT HEATING | SEE CHART 1C-4. |
| - INSUFFICIENT OR NO COOLING | SEE CHART 1C-5. |
| - IMPROPER DEFOGGER OR HEATED MIRROR OPERATION | SEE CHART 1C-7. |
| - INCORRECT OUTSIDE AIR TEMPERATURE DISPLAY | SEE CHART 1C-9. |

C9114

Figure 1C-8 - ACAC Diagnostic System Check Operation Flow Chart

Figure 1C-9 - On-board Diagnostic System Check Operation Flow Chart

To display HVAC DTCs, select pointer number “-02”, and press the “MIDDLE” switch. At this time any current and history trouble codes will be displayed. A failure indicates that the control has detected an open, short to ground or faulty component in that circuit. While that failure is detected, the control will use a default value. When the graphic display is displaying numbers 200 to 299, they appear as numbers 100 through 199 with a “-” in front of them. For example, the value of 200 would be displayed as “-100.”

HVAC DTCs can be cleared from H-A/C control by pressing the “OFF” button while in diagnostic pointer number “-02” while the HVAC DTCs are displaying.

To exit the self-diagnostic mode, press the “AUTO” switch.

TECH 1

The **Tech 1** can also be used to display HVAC DTCs, clear HVAC DTCs and display HVAC data.

HVAC DTCs in the Tech 1 will display as a three digit number. The H-A/C control HVAC DTC 01 (current) [DTC 101 (history)] will display in the Tech 1 as 001C (current) and DTC 001H (history). The remaining HVAC DTCs will display in a like manner.

Looking at other systems on CKT 800 (with a scan tool) and returning to the “HVAC” selection can cause an HVAC DTC 26 to set in the H-A/C control. When diagnosing an HVAC DTC 26, clear the DTC and check for HVAC DTCs again.

The **Tech 1** cartridge used for the **Tech 1** is mass storage cartridge #3000003. Refer to the **Tech 1** operators manual for further information on Tech 1 use and procedures. Below is a list of HVAC data that can be read in the Tech 1.

HVAC Program No.	0-255
Air Delivery Mode	See table
Blower Duty Cycle	0%-50%
A/C Comp On Time	0 = OFF, 1 = ON
Mix Door Com	0-255
Mix Door FDBK	0-255
In-car Air Temp	(Temp display in) C°/F°
Ambient Air Temp	(Temp display in) C°/F°
Sun Load Input	A/D counts
HVAC Program No.	A/D counts
Full Cold Pos.	A/D counts
Full Hot Pos.	A/D counts

"ON-BOARD" DISPLAY	TECH 1 DISPLAY
00 = OFF	OFF
01 = RECIRC	RECIRC
02 = AC (MIDDLE)	AC (MIDDLE)
03 = BI-LEVEL (BLEND)	BI-LEVEL (BLEND)
04 = DEFOG	DEFOG
05 = HEAT (FLOOR)	HEAT (FLOOR)
06 = DEFROST	DEFROST
07 = DELAY	DELAY
08 = PURGE	PURGE
09 = A/C PURGE	A/C PURGE

Diagnostic Pointers and Parameters

Figure 1C-9

Refer to Figure 1C-9 for a list diagnostic pointers and parameters with their display ranges and default values.

Inputs

The inside, outside temperature, and sun load sensors are inputs to the H-A/C control. These inputs along with the feedback from the electric actuator potentiometer are used by the H-A/C control to determine the correct temperature valve position, blower motor speed and air delivery mode.

Outputs

The H-A/C control sends outputs to the blower motor control module, the rear defogger relay, PCM, electric actuator and vacuum/electric solenoid to control the ACAC system.

Diagnostic Pointers and Parameters

Figure 1C-4

Refer to Figure 1C-4 for a list diagnostic pointers and parameters with their display ranges and default values.

Inputs

The inside, outside temperature, and sun load sensors are inputs to the H-A/C control. These inputs along with the feedback from the electric actuator potentiometer are used by the H-A/C control to determine the correct temperature valve position, blower motor speed and air delivery mode.

Outputs

The H-A/C control sends outputs to the blower motor control module, the rear defogger relay, PCM, electric actuator and vacuum/electric solenoid to control the ACAC system.

DIAGNOSTIC POINTERS AND PARAMETERS			
Pointer #		Display Range	Default Value
-02	ACAC (HVAC) System Diagnostic Trouble Codes	In this section.	
		Parameters	
-05	Program Number	0-255 Parameters	—
-07	Commanded Blower Motor Speed	0-128	—
-14	Vehicle Speed	In mph	25 (mph)
-15	HVAC Learn Mode (Temperature Calibration Offset)	-5° to 5° (F)	—
-18	Sun Load Temperature Sensor	0-255	240
-20	Current Temperature Valve Position	0-255	—
-22	Temperature Valve Position (Full Cold)	180-250	180
-23	Temperature Valve Position (Full Hot)	5-60	60
-24	Coolant Temperature	In °C	91°C
-25	Commanded Temperature Valve Position	0-255	128

-37	EEPROM revision #	—	—

Figure 1C-10 - Diagnostic Pointers and Parameters

Overrides

The program number (pointer number "-05") is displayed as a number between 0 and 255 in the diagnostic mode. It is shown where the climate control set temperature is normally displayed. This number represents various levels of heating and cooling effort. As it first appears, the number displayed is the program number currently being used by the ACAC system. As operating conditions and other inputs change, this number will automatically change to control the desired temperature setting.

The automatic calculation of program number can be bypassed by manual override using the "TEMP UP" and "TEMP DOWN" switch on the H-A/C control panel. Pressing the "TEMP UP" switch will force the program number to increase at a three increment rate until a value of "253 to 255" is reached. "255" represents the maximum amount of heat the ACAC system can produce at that given engine temperature.

Pressing the "TEMP DOWN" switch will force the program number to decrease until the value of "0 to 2" is reached which represents the maximum amount of air conditioning the system can produce. This override has a wrap-around feature, if the program number sequence is continued past either end.

HVAC LEARN MODE (TEMPERATURE CALIBRATION OFFSET)

Figure 1C-5

This feature allows the ACAC system to be custom calibrated to the desire of the operator. This is done by programming an offset value in the memory to increase or decrease the actual interior temperature above or below the set temperature. During the calibration offset procedure, the procedure can be aborted any time before the new calibration is locked in by pressing the "AUTO" switch.

CLIMATE CONTROL IN DIAGNOSTIC MODE

Upon entering the diagnostic mode, the climate control will operate in whatever mode was being commanded just prior to depressing the "TEMP" up and the "OFF" switches. Though the display may change just as the switches are depressed, the prior operating mode is remembered and will resume after the diagnostic mode is entered.

SYSTEM RESPONSE PROCEDURE

Diagnostic Pointers and Parameters

Figure 1C-4

Refer to Figure 1C-4 for a list diagnostic pointers and parameters with their display ranges and default values.

Inputs

The inside, outside temperature, and sun load sensors are inputs to the H-A/C control. These inputs along with the feedback from the electric actuator potentiometer are used by the H-A/C control to determine the correct temperature valve position, blower motor speed and air delivery mode.

Outputs

The H-A/C control sends outputs to the blower motor control module, the rear defogger relay, PCM, electric actuator and vacuum/electric solenoid to control the ACAC system.

SYSTEM RESPONSE PROCEDURE

Figure 1C-11

1. Enter diagnostic mode.
 - Press "OFF" and "TEMP" up switches at the same time.
2. Select pointer number "-15".
 - Use fan up and fan down switches.
3. Show current "LEARN VALUE."
 - Press "MIDDLE" switch.
4. Enter "LEARN MODE."
 - Press "TEMP" down and "VENT" switches at the same time. (°C/°F will illuminate).
5. Change temperature calibration test offset.
 - Press the "TEMP" up or "TEMP" down switches to change value.
 - The "LEARN VALUE" can be changed $\pm 3^{\circ}\text{C}$ ($\pm 5^{\circ}\text{F}$).
6. Lock in "LEARN VALUE."
 - Press "VENT" and front defrost switches for five seconds. Value will blink off then on indicating new "LEARN VALUE" HAS BEEN LOCKED INTO MEMORY.
 - "LEARN MODE" WILL EXIT.

Refer to Figure 1C-11 in this section for proper system response to H-A/C control settings.

ACAC SYSTEM CHECK

Figure 1C-12

Refer to Figure 1C-12 for the ACAC Diagnostic System Check. This chart should be used first when diagnosing a customer HVAC complaint.

DIAGNOSTIC AIDS

CONNECTOR VIEW

Figure 1C-13

Refer to Figures 1C-13 for connector view of the H-A/C control connector.

CIRCUIT DIAGRAMS

Figures 1C-14 and 1C-15

Refer to Figures 1C-14 and 1C-15 for a complete wiring diagram overview of the automatic control air conditioning circuits.

COMPONENTS LOCATION

Figures 1C-16 and 1C-17

VACUUM SYSTEM DIAGRAM

Refer to "Improper Air Delivery," CHART 1C-3 for a diagram of the automatic control air conditioning vacuum system.

H-A/C CONTROL SETTINGS	EXPECTED RESULTS
• "OFF"	• "EXT TEMP" will display temperature. • Blower motor does not run.
• "AUTO" 16°C (60°F)	• System is in "RECIRCULATION" mode. • Blower motor runs at maximum speed. • Air flows from instrument panel outlets. • Engine idle speed increases. • A/C compressor turns on (ambient temp above 35°F). • Air flow becomes cold.
• "LO" (Fan)	• Blower motor speed reduces as long as button is pressed. • Blower motor speed is displayed while button is pressed. • Blower motor runs at speed attained when button is released.
• "HI" (Fan)	• Blower motor speed increases as long as button was depressed. • Blower motor speed is displayed. • Blower motor runs at speed attained when button was released.
• "ECON"	• A/C compressor turns off. • Air flow may start to warm.
• "AUTO" 36°C (90°F)	• System is in "HEATER" mode. • Blower motor runs at maximum speed. • Air flows from floor outlets with some bleed to front and side window defroster outlets. • Air flow becomes warm.
• "AUTO" 24°C (75°F)	• Blower motor speed reduces as in-car temperature approached 24°C (75°F). • A/C system maintains in-car temperature at approximately 24°C (75°F).
• "DEFOG"	• Manual Mode. • Air flows from windshield outlet, side window outlets with a 50% bleed to the floor outlets.
• DEF (Front)	• Some bleed to heater outlets. • Air flows from windshield outlet and side window outlets.
• "REAR DEFOGGER"	• Rear defogger operation for 10 minutes will occur after button is pushed. Pushing the button again (during same ignition cycle) will allow 5 additional minutes of operation.
• "BLEND"	• Manual mode. • Fifty percent of airflow will be out of the I/P outlets. • Fifty percent of airflow out of floor outlets.
• "MIDDLE"	• Manual mode. • One hundred percent of airflow will be out of the I/P outlets.
• "FLOOR"	• Manual mode. • One hundred percent of airflow will be out of the floor outlets.

Figure 1C-11 - System Response Chart (C68)

ACAC SYSTEM CHECK

- TURN IGNITION TO "RUN" AND ENTER DIAGNOSTICS.
- ARE ANY HVAC DIAGNOSTIC TROUBLE CODES (DTC) DISPLAYED? (SEE FIGURE 1C-8.) (IF H-A/C CONTROL DISPLAY IS BLANK, REFER TO "CHART 8; INOPERATIVE H-A/C CONTROL" IN THIS SECTION.)

NO DTC DISPLAYED.

- DTC DISPLAYED.
- REFER TO "DIAGNOSTIC TROUBLE CODES (DTC)" IN THIS SECTION.

H-A/C CONTROL OPERATIVE BUT WILL NOT ENTER DIAGNOSTICS.

REPLACE H-A/C CONTROL.

- EXIT DIAGNOSTICS.
- START ENGINE.
- SELECT 16°C (60°F) AND "HI" BLOWER MOTOR ASSEMBLY SPEED.
- AMBIENT TEMPERATURE MUST BE ABOVE 10°C (50°F).
- DO BLOWER MOTOR AND COMPRESSOR OPERATE?

BOTH BLOWER MOTOR AND COMPRESSOR OPERATE.

NO COMPRESSOR OPERATION.

BLOWER MOTOR DOES NOT OPERATE.

BOTH BLOWER MOTOR AND COMPRESSOR DO NOT OPERATE.

INSTALL GAGE SET IS A/C LOW SIDE PRESSURE ABOVE 55 psi?

REFER TO CHART 1 IN THIS SECTION.

REFER TO CHART 1 IN THIS SECTION AND SECTION 6E3-C10.

YES

NO

REFER TO SECTION. 6E3-C10.

LEAK CHECK A/C SYSTEM. REFER TO SECTION 1B.

- IF COMPLAINT IS:
 - IMPROPER AIR DELIVERY SEE CHART 1C-3.
 - INSUFFICIENT OR NOT HEATING SEE CHART 1C-4.
 - INSUFFICIENT OR NO COOLING SEE CHART 1C-5.
 - IMPROPER DEFOGGER OR HEATED MIRROR OPERATION SEE CHART 1C-7.
 - INCORRECT OUTSIDE AIR TEMPERATURE DISPLAY SEE CHART 1C-9.

CHART 1C-1

BLOWER MOTOR WILL NOT RUN IN ANY MODE (C68)

Circuit Description:

Blower motor speed is determined by the amount of voltage applied to the motor. This voltage varies from approximately 4 volts (low speed) to approximately 12 volts (high speed).

The speed at which the blower motor operates is governed by the H-A/C control. The blower motor speed can be adjusted manually by pressing the blower control "UP" or "DOWN" switches or automatically by placing the H-A/C control in the "AUTO" mode.

The H-A/C control sends blower request information to the blower motor control module in the form of a variable voltage signal. This voltage signal ranges from approximately 2.5 volts, for minimum blower motor speed, to approximately 7 volts, for maximum blower motor speed. An amplifier and

driver circuit in the blower motor control module supplies between 4 and 12 volts to the blower motor according to the request signal from the H-A/C control. Blower motor voltage is also sent back to the H-A/C control to insure blower speed stability and the indicate any failure in the blower motor circuitry.

Diagnostic Aids:

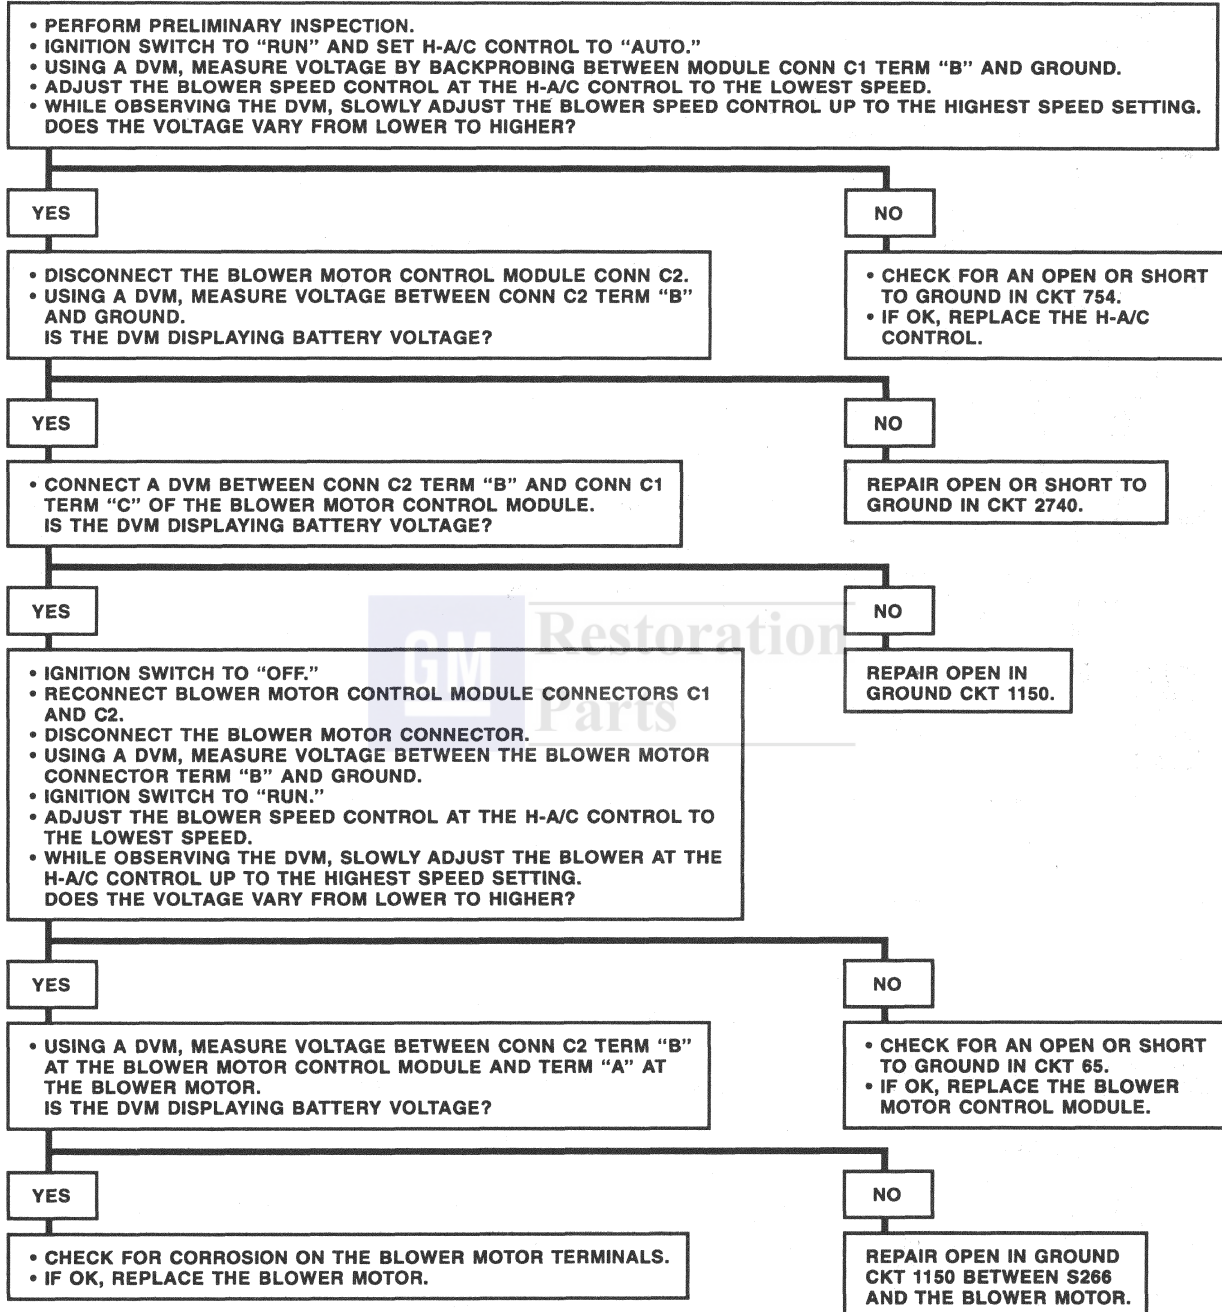

1. Check for an open in I/P fuse 38. If open, repair short to ground in CKT 940.
2. Make sure grounds G200 and G202 are clean and tight.
3. If blower motor can be controlled in either the manual mode or the auto mode but not in both, replace the H-A/C control.

CHART 1C-1 BLOWER MOTOR WILL NOT RUN IN ANY MODE (C68)

IMPORTANT:

- ACAC SYSTEM CHECK MUST BE PERFORMED FIRST.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10305

CHART 1C-2

BLOWER MOTOR RUNS ALL OF THE TIME OR HIGH SPEED ONLY (C68)

Circuit Description:

Blower motor speed is determined by the amount of voltage applied to the blower motor. This voltage varies from approximately 4 volts (low speed) to approximately 12 volts (high speed).

The speed at which the blower motor operates is governed by the H-A/C control. The blower motor speed can be adjusted manually by pressing the blower control "UP" or "DOWN" switches or automatically by placing the H-A/C control in the "AUTO" mode.

The H-A/C control sends blower request information to the blower motor control module in the form of a variable voltage signal. This voltage signal ranges from approximately 2.5 volts, for minimum blower speed, to approximately 7 volts, for maximum blower speed. An amplifier and driver circuit in the blower motor control module supplies between 4 and 12 volts to the blower motor according to the request signal from the H-A/C control. Blower motor voltage is also sent back to the H-A/C control to insure blower speed stability and to indicate any failure in the blower motor circuitry.

CHART 1C-3 IMPROPER AIR DELIVERY

Circuit Description:

Air Delivery

With the ignition switch in "RUN," voltage is applied through I/P fuses #20 and #33 to the H-A/C control. The operating mode of the system is determined by buttons on the front panel. Ground signals determine which air valves are to be operated as well as the position of the temperature valve.

The vacuum/electric solenoid contains the solenoid valves that control the vacuum actuators. When the solenoids are de-energized, the valves vent the vacuum actuators, allowing the vacuum actuator to return to the vent position.

Air Delivery

H-A/C Control

With the ignition switch in "RUN," voltage is applied through I/P fuses #20 and #33 to the H-A/C control. The operating mode of the system is determined by buttons on the front panel. Ground signals determine which air valves are to be operated as well as the position of the temperature valve.

Vacuum/Electric Solenoid

The vacuum/electric solenoid contains the solenoid valves that control the vacuum actuators. When the solenoids are de-energized, the valves vent the vacuum actuators, allowing the vacuum actuator to return to the vent position.

Recirculation Valve

The recirculation valve closes off most of the outside air inlet, so that the air from the inside of the vehicle is re-circulated through the A/C system for

maximum cooling. The outside air inlet is partially closed when vacuum is applied to the actuator. When the air inlet valve actuator is vented, the recirculation valves close off the in-car air inlet which allows outside air to be drawn into the vehicle.

Temperature Valve

The temperature valve determines how much air flows through the heater core, which determines the temperature of the air to the outlets. It is moved by the temperature valve electric actuator. The position of the valve is determined by the temperature selected at the H-A/C control.

DEF/Heater

The DEF/heater valve determines whether air flow will be directed to the windshield defrost outlets. With vacuum applied to the gray hose at the defroster valve actuator, the valve is positioned to allow air flow to the windshield defrost outlets, with some bleed to the heater outlet.

Upper/Lower Mode

The upper/lower mode valve can assume three positions and is operated by a bi-directional vacuum port which can move the valve to either of two positions. If no vacuum is applied to either vacuum port, the valve is in mid-position. Air flow with the valve in mid-position will be delivered to the panel outlets and the floor outlets (Bi-Level). When the upper/lower solenoid (#3) (tan vacuum hose) is operated, the valve is positioned to direct air flow to the A/C outlets. When the upper/lower solenoid (#4) (red vacuum hose) is operated, the valve is positioned to direct air flow to the heater outlets and defroster outlets.

Temperature Control

Two temperature variable resistors (sensors) are connected to the H-A/C control to provide in-car and outside temperature information. These devices are thermistors which decrease in resistance as the temperature of the device increases. The one exception to this is the solar sensor, which is a photo diode. The photo diode output decreases with increasing light intensity.

Circuits within the H-A/C control use the input from the in-car sensor and the sun load sensor and the set temperature selected by the driver to determine whether the air should be heated or cooled to bring the inside of the vehicle to the selected temperature. The input from the ambient temperature sensor is used to determine the amount of heating or cooling required to bring the temperature inside the vehicle to the selected value as quickly as possible.

Diagnostic Aids:

1. If the temperature valve electric actuator is displaced from its proper position, it will automatically calibrate itself to the proper position if the battery power is removed from the H-A/C control. To recalibrate the temperature valve actuator, remove and install I/P fuse 33.
2. Make sure that ground G202 is clean and tight.
3. Check I/P fuse 33. If open, check for a short to ground in CKT 40.
4. Check I/P fuse 20. If open, check for a short to ground in CKT 241.
5. Check for normal operation of engine vacuum check valve.

With engine warm and running in idle:

6. Check manifold vacuum at the violet hose from the vacuum tank to the electric solenoid.
7. Check for vacuum at the violet hose from the vacuum tank to the electric solenoid.

8. Check that the vacuum hoses from the electric solenoid to the vacuum actuators are connected and in good condition.
9. Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity/voltage check. Refer to SECTION 8A.
10. Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems. Refer to SECTION 8A.

Vacuum Diagnosis

1. Check vacuum supply to vacuum/electric solenoid (black vacuum hose) while engine is running.
 - Vacuum should be approximately 38 to 43 cm Hg (15 to 16 inch Hg) with engine running.
 - Vacuum should remain at approximately 38 to 43 cm Hg (15 to 16 inch Hg) when engine is turned off.
2. Test each vacuum actuator by disconnecting the vacuum hose and applying vacuum directly to the actuator. Repair or replace as necessary.
3. Reconnect all vacuum and electrical connections. Run engine and cycle through the operating modes and full temperature range of the H-A/C control while observing the vacuum actuators.
 - Check for vacuum to the vacuum actuators by noting vacuum actuator position. When vacuum is applied, the actuator will retract refer to the top of page 1C-48.
 - If a vacuum actuator retracts when it should not, replace the H-A/C control, after performing the diagnostics on page 1C-53.
 - If a vacuum actuator does not retract when it should, check for vacuum leaks, collapsed vacuum hoses, binding valves or bad connections at the vacuum/electric solenoid. If OK, replace the vacuum/electric solenoid.

! IMPORTANT:

- FOR SOLENOID/VACUUM CONTROL, REFER TO "AIR DELIVERY VACUUM DISTRIBUTION TABLE," IN SECTION 1C. VACUUM IS ROUTED TO THE CORRESPONDING ACTUATOR WHEN THE SOLENOID IS ENERGIZED. VACUUM IS SHOWN IN "DEFROST" MODE.

CHART 1C-3 IMPROPER AIR DELIVERY (C68)

- TURN IGNITION SWITCH TO "RUN."
- SET H-A/C CONTROL TO "AUTO" 24°C (75°F).
- WITH A TEST LIGHT TO GROUND, BACKPROBE TERM "6" OF THE VACUUM/ELECTRIC SOLENOID. IS TEST LIGHT "ON"?

YES

- TURN IGNITION "OFF."
- DISCONNECT THE VACUUM/ELECTRIC SOLENOID CONNECTOR.
- USING A DVM, CHECK RESISTANCE OF VACUUM/ELECTRIC SOLENOID TERMINALS "6" TO "1", "2", "3", "4" AND "5". IS RESISTANCE BETWEEN 70 TO 120 OHMS FOR ALL TERMINALS?

YES

- RECONNECT VACUUM/ELECTRIC SOLENOID CONNECTOR.
- TURN IGNITION TO "RUN."
- SET H-A/C CONTROL TO "OFF."
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5" OF THE VACUUM/ELECTRIC SOLENOID.
- TEST LIGHT SHOULD BE "ON" FOR TERMINAL "4" AND "OFF" FOR TERMINALS "1", "2", "3" AND "5". IS IT?

YES

- CHECK FOR SHORT TO GROUND IN CKT 363.
- IF OK, PROCEED WITH DIAGNOSIS.
- SET H-A/C CONTROL TO "AUTO" 16°C (60°F).
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5" OF THE VACUUM/ELECTRIC SOLENOID.
- TEST LIGHT SHOULD BE "ON" FOR TERMINALS "2" AND "3" AND "OFF" FOR TERMINALS "1", "4" AND "5". IS IT?

YES

- CHECK FOR SHORT TO GROUND IN CKTS 362 AND 361.
- IF OK, PROCEED WITH DIAGNOSIS.
- SET H-A/C CONTROL TO "AUTO" 32°C (90°F).
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5" OF THE VACUUM/ELECTRIC SOLENOID.
- TEST LIGHT SHOULD BE "ON" FOR TERMINALS "4" AND "5" ONLY. IS IT?

YES

- CHECK FOR SHORT TO GROUND IN CKT 706.
- IF OK, PROCEED WITH DIAGNOSIS.
- PUSH THE H-A/C CONTROL BUTTON FOR "BLEND."
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5".
- TEST LIGHT SHOULD BE "ON" FOR TERM "5" ONLY. IS IT?

YES

- PUSH THE H-A/C CONTROL BUTTON FOR THE FRONT DEFROSTER MODE.
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5".
- TEST LIGHT SHOULD BE "ON" FOR TERMINALS "1" AND "4" ONLY. IS IT?

YES

- CHECK FOR SHORT TO GROUND IN CKT 366.
- IF OK, PROCEED WITH DIAGNOSIS.
- PUSH THE H-A/C CONTROL BUTTON FOR THE DEFOG MODE.
- WITH A TEST LIGHT TO B+, BACKPROBE TERMINALS "1", "2", "3", "4" AND "5".
- TEST LIGHT SHOULD BE "ON" FOR TERM "4" ONLY. IS IT?

YES

- NO TROUBLE FOUND WITH THE H-A/C CONTROL.
- PERFORM VACUUM DIAGNOSIS AS OUTLINED IN THIS SECTION.

NO

- REPAIR OPEN OR SHORT TO GROUND IN CKT 241.

NO

- CHECK CONNECTIONS AT VACUUM/ELECTRIC SOLENOID.
- IF OK, REPLACE VACUUM/ELECTRIC SOLENOID.

NO

- IF TEST LIGHT DOESN'T GO "ON" FOR TERMINAL "4", CHECK FOR OPEN OR SHORT TO B+ IN CKT 363.
- IF TEST LIGHT GOES "ON" FOR TERMINALS "1", "2", "3" AND "5", CHECK FOR SHORT TO GROUND IN CKTS 362, 366, 706 AND 361.
- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

NO

- IF TEST LIGHT DOESN'T GO "ON" FOR TERMINALS "2" AND "3", CHECK FOR OPEN OR SHORT TO B+ IN CKTS 362 AND 361.
- IF TEST LIGHT GOES "ON" FOR TERMINALS "1", "4" AND "5", CHECK FOR SHORT TO GROUND IN CKTS 706, 363 AND 366.
- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

NO

- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

NO

- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

NO

- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

NO

- CHECK CONNECTIONS AT H-A/C CONTROL.
- IF OK, REPLACE H-A/C CONTROL.

CHART 1C-4

INSUFFICIENT OR NO HEATING (C68)

Circuit Description:

Based on the various temperature sensor inputs, sun load sensor input, input from the PCM and the set temperature, the H-A/C control determines the required temperature and delivery mode to achieve and maintain the selected comfort level.

Diagnostic Aids:

1. Check for proper engine coolant level.
2. Check engine for proper operating temperature (approximately 91°C (195°F)). If engine does not reach 91°C (195°F), replace thermostat.
3. With engine at normal operating temperature, check heater inlet and outlet hose temperature.
 - Heater inlet hose temperature should be at or near engine operating temperature.
 - Heater outlet hose temperature should be slightly cooler than the heater inlet hose.
 - If heater hose temperatures are incorrect, replace heater core.
4. Inspect plenum area (at base of windshield) for debris or anything that may cause airflow restriction.

**IMPORTANT:**

- ACAC SYSTEM CHECK MUST BE PERFORMED FIRST.

CHART 1C-4

(Page 1 of 2)
INSUFFICIENT OR NO HEATING
(C68)

- PERFORM PRELIMINARY INSPECTION.
- START ENGINE AND ALLOW IT TO REACH NORMAL OPERATING TEMPERATURE.
- SELECT "AUTO" MODE AND SET TEMPERATURE TO 32°C (90°F). BLOWER MOTOR SHOULD BE IN HIGH SPEED AND A LARGE VOLUME OF AIR SHOULD BE DISCHARGED FROM FLOOR OUTLETS AT APPROXIMATELY 60°C (140°F).

IMPROPER
AIR
DELIVERY

REFER TO
CHART 1C-3.

IMPROPER AIR TEMPERATURE

- ENTER DIAGNOSTICS.
 - SELECT POINTER NUMBER "-20" (CURRENT TEMPERATURE VALVE POSITION). DISPLAY AND RECORD VALUE.
 - SELECT POINTER NUMBER "-25" (COMMANDED TEMPERATURE VALVE POSITION). DISPLAY AND RECORD VALUE.
- ARE THE VALUES OF POINTER NUMBERS "-20" AND "-25" EQUAL TO ± 5 OF EACH OTHER?

YES

- EXIT DIAGNOSTICS.
- SELECT "AUTO" AND SET TEMPERATURE TO 32°C (90°F).
- IGNITION "OFF."
- DISCONNECT ELECTRICAL CONNECTOR FROM ELECTRIC ACTUATOR AND REMOVE ELECTRIC ACTUATOR.

NOTICE: DO NOT ATTEMPT TO OPERATE THE TEMPERATURE VALVE ELECTRIC ACTUATOR WHEN IT IS DISCONNECTED FROM THE HEATER AND AIR CONDITIONING MODULE OR DAMAGE TO THE ELECTRIC ACTUATOR MAY RESULT.

- START ENGINE.
- SELECT "AUTO" AND SET TEMPERATURE TO 32°C (90°F), MAKING SURE THAT THE BLOWER MOTOR IS OPERATING ON "HI FAN."
- MANUALLY ROTATE THE TEMPERATURE VALVE FROM ONE STOP TO THE OTHER STOP (APPROXIMATELY 65 DEGREES OF ANGLE) AND NOTE AIR TEMPERATURE AND VALVE POSITION. DOES AIR TEMPERATURE CHANGE FROM AMBIENT (OUTSIDE) TEMPERATURE TO AT LEAST 49°C (120°F)?

YES

- REINSTALL ELECTRIC ACTUATOR.
- RECALIBRATE SYSTEM BY REMOVING I/P 10 AMP FUSE 33 FOR ONE MINUTE. REINSTALL FUSE AND TURN IGNITION TO "RUN" POSITION FOR FUSE LOCATION. REFER TO ELECTRICAL DIAGNOSIS 8A-11.
- IF PROBLEM STILL EXISTS, REPLACE ELECTRIC ACTUATOR.

NO

INSPECT HEATER CORE FOR AIR RESTRICTIONS THROUGH FINS.

NO RESTRICTIONS

REPLACE HEATER AND EVAPORATOR MODULE ASSEMBLY.

RESTRICTIONS

REPLACE HEATER CORE.

IMPROPER BLOWER MOTOR SPEED

REFER TO
CHART 1C-1
OR 1C-2.

PROPER AIR TEMPERATURE
AND AIR DELIVERY

CONTINUED ON
PAGE 2 OF 2

NO

- DISCONNECT ELECTRIC ACTUATOR ELECTRICAL CONNECTOR.
- WITH IGNITION IN "RUN" POSITION USING A DVM, CHECK FOR BATTERY VOLTAGE AT TERM "5". IS BATTERY VOLTAGE PRESENT AT TERM "5"?

YES

- WITH TEMPERATURE SET AT 32°C (90°F) USING A DVM, MEASURE VOLTAGE AT TERM "6". IS VOLTAGE LESS THAN .5V?

YES

REPLACE ELECTRICAL ACTUATOR.

NO

REPAIR OPEN IN CKT 241 BETWEEN TERM "5" AND S211.

NO

- CHECK FOR A SHORT TO B+ IN CKT 1199.
- IF OK, REPLACE H-A/C CONTROL.

CHART 1C-4

BLANK

CHART 1C-5

INSUFFICIENT OR NO COOLING (C68)

Circuit Description:

Based on the various temperature sensor inputs, sun load sensor input, input from the PCM and the set temperature, the H-A/C control determines the required temperature and delivery mode to achieve and maintain the selected comfort level.

Diagnostic Aids:

1. Check to make sure instrument panel outlets are open by sliding levers to the left.
2. If vehicle is not equipped with engine driven cooling fan, check primary (right-hand) cooling fan for operation during air conditioning operation. If fan is inoperative, refer to SECTION 6E3-C12 for diagnosis.
3. Check the condenser for debris which may obstruct airflow through the fins.
4. Check the plenum area (at base of windshield) for any debris which may prevent proper airflow into the vehicle interior.
5. With air conditioning system operating, check accumulator temperature. Accumulator temperature should be near freezing (cold to touch). If this is not true, service the refrigeration system. Refer to SECTION 1B and "Refrigerant System Check," CHART 1C-6 in this section.
6. Check the air conditioning system for overcharge. If system is overcharged, recover, recycle, and recharge air conditioning system. There should be 0.8 kg (1 pound 12 ounces) of R-134a refrigerant.

! IMPORTANT:

• ACAC SYSTEM CHECK MUST BE PERFORMED FIRST.

- PERFORM PRELIMINARY INSPECTION.
- AMBIENT TEMPERATURE MUST BE ABOVE 10°C (50°F).
- IF VEHICLE IS NOT EQUIPPED WITH ENGINE DRIVEN FAN, PLACE AUXILIARY FAN IN FRONT OF CONDENSER ASSEMBLY.
- START ENGINE.
- SELECT "AUTO" MODE AND SET TEMPERATURE TO 16°C (60°F). BLOWER MOTOR ASSEMBLY SHOULD BE IN HIGH SPEED AFTER THREE MINUTES OF OPERATION, A LARGE VOLUME OF AIR SHOULD BE DISCHARGED FROM INSTRUMENT PANEL OUTLETS AT LEAST 11°C (20°F) COOLER THAN AMBIENT TEMPERATURE.

CHART 1C-5

• CHECK AIR OUTLET TEMPERATURE.
IS TEMPERATURE AT LEAST 11°C (20°F) COOLER THAN AMBIENT TEMPERATURE?

NO

CHECK FOR EVAPORATOR RESTRICTIONS.

IF RESTRICTIONS, REPAIR OR
REPLACE EVAPORATOR.

IF NO RESTRICTIONS, REPLACE
HEATER AND AIR CONDITIONING
EVAPORATOR MODULE ASSEMBLY.

YES

- REINSTALL TEMPERATURE VALVE ACTUATOR.
- RECALIBRATE SYSTEM BY REMOVING I/P HVAC BAT FUSE #33 FOR ONE MINUTE. REINSTALL FUSE AND TURN IGNITION TO "RUN" POSITION.
- FOR FUSE LOCATION, REFER TO SECTION 8A-11.
- IF A PROBLEM STILL EXISTS, REPLACE ELECTRIC ACTUATOR.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10318

CHART 1C-6

REFRIGERANT SYSTEM CHECK (C68)

System Description:

Under normal conditions, liquid refrigerant passes through the orifice tube in the condenser outlet pipe and expands in the evaporator. Expansion occurs due to restricted flow caused by the orifice tube, which reduces pressure in the evaporator. The refrigerant absorbs large amounts of heat from the air passing through the evaporator, and gradually begins to boil as it passes through the evaporator. It is almost completely vaporized as it enters the accumulator. Liquid refrigerant is prevented from entering the compressor by the accumulator.

If a low charge or a partially plugged orifice tube exists, the compressor will cycle rapidly because the evaporator pressure is so low that the refrigerant boils almost immediately instead of gradually. Relatively warm air will come out of the instrument panel outlets under such conditions.

CHART 1C-6 REFRIGERANT SYSTEM CHECK (C68)

IMPORTANT:

- ACAC DIAGNOSTIC SYSTEM CHECK MUST BE PERFORMED FIRST.
- AMBIENT TEMPERATURE MUST BE ABOVE 10°C (50°F).
- CHECK FOR RESTRICTED AIR FLOW AT CONDENSER ASSEMBLY.

- START ENGINE.
- USE AUXILIARY FAN IN FRONT OF RADIATOR (IF VEHICLE IS NOT EQUIPPED WITH ENGINE DRIVEN FAN).
- WITH ENGINE AT 2000 rpm, SELECT "AUTO" MODE AND SET TEMPERATURE TO 16°C (60°F).
- ENTER DIAGNOSTICS AND SELECT POINTER NUMBER "-02". IS "EXT TEMP" GRAPHIC DISPLAYED ON H-A/C CONTROL?

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10319

CHART 1C-7

IMPROPER DEFOGGER OR HEATED MIRROR OPERATION (C67 AND C68)

Circuit Description:

When the ignition switch is turned to "RUN," voltage is applied from I/P Fuse Block Fuses 33 (C68) and 20 to the H-A/C control. When the rear defogger switch is pressed to "ON," voltage is momentarily applied to the defog request input of the solid state timer. Once requested, the timer will close the internal contacts from terminal "D15" to terminal "C1" (C68) or terminal "A1" to terminal "A8" (C67) of the H-A/C control, lighting the "ON" indicator and energizing the coil of the rear defogger relay with voltage applied from I/P Fuse Block Circuit Breaker 4 and CKT 1640 to CKT 293, and I/P Fuse Block Fuse 1 to the heated mirrors.

The solid state timer with the H-A/C control will control the time the internal contacts are closed. When the ignition switch is turned to "RUN" and the rear defogger switch is turned to "ON" for the first time, the defog cycle lasts 10 minutes. Further operation will result in 5 minute defog cycles. The defog cycle is reset to 10 minutes when the ignition switch is turned to "OFF" and back to "RUN."

Diagnostic Aids:

1. Check I/P Circuit Breaker 4. If open, check for short to ground in CKT 1640.
2. Check the rear defogger grid for opens.
3. Check that grounds G201, G202, or G300 and G400 are clean and tight.
4. If both mirror defoggers are inoperative but rear defogger operates normally, check I/P fuse 44. If open, check for a short to ground in CKT 676.
5. Check I/P fuse 11. If open, check for a short to ground in CKT 39.
6. Check I/P fuse 33 (C68). If open, check for a short to ground in CKT 40.
7. Check I/P fuse 20. If open, check for a short to ground in CKT 241.
8. Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity voltage check. Refer to SECTION 8A.
9. Check for proper installation of after market electronic equipment which may affect the integrity of other systems. Refer to SECTION 8A.

CHART 1C-8

INOPERATIVE H-A/C CONTROL (C68)

Circuit Description:

The H-A/C control receives battery voltage at all times through CKT 40. This input is used to retain the volatile memory or the H-A/C control. CKT 241 is an ignition input used to "wake up" the H-A/C control. CKT 351 supplies ground to the H-A/C control.

Diagnostic Aids:

- Check I/P fuse numbers 20 and 33 for open circuits. If open circuit is found, check for short to ground.

CHART 1C-8 INOPERATIVE H-A/C CONTROL (C68)

**IMPORTANT:**

- SYSTEM RESPONSE CHART MUST BE CHECKED FIRST.

• USING A DVM, BACKPROBE THE HVAC CONTROL ASSEMBLY CONNECTOR BETWEEN TERM "C12" AND TERM "C1". IS B+ INDICATED?

YES

• IGNITION SWITCH TO "RUN."
• USING A DVM, BACKPROBE H-A/C CONTROL CONNECTOR BETWEEN TERM "C5" AND TERM "C1". IS B+ INDICATED?

YES

REPLACE THE H-A/C CONTROL.

NO

• CHECK FOR AN OPEN OR SHORT TO B+ IN GROUND CKT 351 BETWEEN G202 AND H-A/C CONTROL.
• IF OK, CHECK FOR AN OPEN OR SHORT TO GROUND IN CKT 40.
• IF OK, REPAIR POOR MATING CONNECTION BETWEEN THE H-A/C CONTROL CONNECTOR AND THE H-A/C CONTROL.

NO

REPAIR OPEN OR SHORT TO GROUND IN CKT 241.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10323

CHART 1C-9

INCORRECT OUTSIDE AIR TEMPERATURE DISPLAY (C68)

System Operation:

The outside air temperature sensor is a thermistor which changes its resistance as outside air temperature changes. As outside air temperature increases, the sensor resistance decreases. The amount of current allowed to pass through the sensor determines the outside air temperature input as monitored on CKT 735.

Outside Air Temperature Display Update

To prevent incorrect outside air temperature display due to engine heat, the H-A/C control will allow the outside air temperature display to increase only after one of the following conditions are met:

When Vehicle is First Started

- Ignition system is turned off for over three hours. The actual outside air temperature will be displayed when the ignition system is turned on.
- Ignition system turned off for less than three hours and engine coolant temperature is less than 10°C (50°F) higher than the outside air temperature reading.

If the above conditions are not met, the outside air temperature display from the previous ignition cycle will be displayed.

When Vehicle is Moving

- Vehicle speed is between 32 and 72 km/h (20 to 45 mph) for three minutes. If the vehicle speed drops below 32 km/h (20 mph), the timer will reset.
- Vehicle speed is above 32 km/h (20 mph) for one minute after reaching 72 km/h (45 mph). If the vehicle speed drops below 32 km/h (20 mph), the timer will reset.

The temperature display will be allowed to decrease at any time.

Diagnostic Aids:

Check for history DTC 101 or 102. While these codes are current, the H-A/C control will use a default value of 9°C (49°F) or 128 A/D counts. There will be no indication that this fault had occurred other than an incorrect outside air temperature display.

Enter diagnostic display mode and display DTCs (if any). Tap on the outside air temperature sensor and wiggle the sensor wiring and electrical connector. If DTC 01 or 02 sets, replace the outside air temperature sensor or repair the electrical connector.

CHART 1C-9 INCORRECT OUTSIDE AIR TEMPERATURE DISPLAY

IMPORTANT:

- ACAC SYSTEM CHECK MUST BE PERFORMED FIRST.

- ENTER DIAGNOSTICS.
 - SELECT POINTER NUMBER "-31" (OUTSIDE AIR TEMPERATURE SENSOR ASSEMBLY INPUT). DISPLAY AND RECORD VALUE.
 - COMPARE RESISTANCE VALUE AND OUTSIDE AIR TEMPERATURE. REFER TO TEMPERATURE VS. OHMS CHART ABOVE.
- IS RESISTANCE VALUE WITHIN SPECIFICATIONS?

NO

- EXIT DIAGNOSTICS.
 - DISCONNECT OUTSIDE AIR TEMPERATURE SENSOR CONNECTOR AND MEASURE RESISTANCE ACROSS SENSOR ASSEMBLY TERMINAL.
 - COMPARE RESISTANCE VALUE AND OUTSIDE AIR TEMPERATURE. REFER TO TEMPERATURE VS. OHMS CHART ABOVE.
- IS VALUE WITHIN SPECIFICATION?

NO

REPLACE
SENSOR.

YES

- REMOVE H-A/C CONTROL.
- CHECK FOR POOR CONNECTIONS AND/OR EXCESSIVE RESISTANCE IN CKTS 735 AND 1791.
- IF OK, REPLACE H-A/C CONTROL.

YES

- ALLOW SUFFICIENT TIME FOR SYSTEM TO UPDATE. REFER TO "SYSTEM OPERATION" ON FACING PAGE.
 - COMPARE RESISTANCE VALUE AND OUTSIDE AIR TEMPERATURE. REFER TO TEMPERATURE VS. OHMS CHART ABOVE.
- IS VALUE WITHIN SPECIFICATIONS?

NO

REPLACE H-A/C
CONTROL.

YES

- INFORM CUSTOMER OF TIME REQUIRED BEFORE SYSTEM WILL UPDATE.
- IF PROBLEM IS INTERMITTENT, REFER TO "DIAGNOSTIC AIDS" ON FACING PAGE.

DTC 01

OUTSIDE AIR TEMPERATURE SENSOR CIRCUIT (C68)

(CIRCUIT OPEN)

Circuit Description:

The outside air temperature sensor is a thermistor used to control the signal voltage at the H-A/C control. The H-A/C control supplies a reference voltage (about 5 volts) on CKT 735 to the sensor. When the outside (ambient) air temperature is cold, the thermistor resistance is high; therefore, the H-A/C control will receive a high signal voltage input. If the outside (ambient) air temperature is hot, the thermistor resistance is low; therefore, the H-A/C control will receive a low signal voltage input. A DTC 01 will be set if the resistance is low; therefore, the H-A/C control will receive a low signal voltage input. A DTC 01 will be set if the resistance seen between CKT 735 and CKT 1791 is above 100.7 k Ω .

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKT 735 stays at 4.5 volts or higher.

Action Taken:

DTC 01 will set in the H-A/C control. The ACAC system will use a default value of 49°F until the fault is cleared. This can be seen by displaying pointer -31 for the outside air temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The system will return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks resistance of outside air temperature sensor.
3. This test checks for normal to above voltage on CKT 735.
4. This test checks for an open in CKT 1791.

Diagnostic Aids:

Visually inspect sensor connector and harness for damage, corrosion or water intrusion. The resistance value of the sensor must be between 282 Ω and 100.7 k Ω [underhood temperature below 82°C (180°F) and above -34°C (-30°F)]. If resistance is not within specifications, replace sensor. Refer to "Outside Air Temperature Sensor" under "Sensors" in this section.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C8774

DTC 02

OUTSIDE AIR TEMPERATURE SENSOR CIRCUIT (C68) (CIRCUIT SHORTED)

Circuit Description:

The outside air temperature sensor is a thermistor used to control the signal voltage at the H-A/C control. The H-A/C control supplies a reference voltage (about 5 volts) on CKT 735 to the sensor. When the outside (ambient) air temperature is cold, the thermistor resistance is high; therefore, the H-A/C control will receive a high signal voltage input. If the outside (ambient) air temperature is hot, the thermistor resistance is low; therefore, the H-A/C control will receive a low signal voltage input. A DTC 01 will be set if the resistance seen between CKT 735 and CKT 1791 is above 100.7k ohms.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKT 735 is at or near zero voltage.

Action Taken:

DTC 02 will set in the H-A/C control. The ACAC system will use a default value of 49°F (or 128 A/D counts) until the fault is cleared. This can be seen by displaying pointer -31 for the outside air temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired, and the system will return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks resistance of outside air temperature sensor.
3. This test checks for a short to ground in CKT 735.

Diagnostic Aids:

Visually inspect sensor connector and harness for damage, corrosion or water intrusion. The resistance value of the sensor must be between 282 Ω and 100.7 k Ω [underhood temperature below 82°C (180°F) and above -34°C (-30°F).] If resistance is not within specifications, replace sensor. Refer to "Outside Air Temperature Sensor" under "Sensors" in this section.

 - IS RESISTANCE VALUE WITHIN SPECIFICATIONS?

YES

NO

- 3
- DISCONNECT H-A/C CONTROL CONNECTOR.
 - USING A DVM TO GROUND, CHECK FOR A SHORT TO GROUND AT TERM "D3" OF THE H-A/C CONTROL CONNECTOR.
 - IS CONTINUITY INDICATED?

REPLACE OUTSIDE AIR TEMPERATURE SENSOR.

YES

NO

REPAIR SHORT TO GROUND IN CKT 735.

- CHECK CKT 735 FOR AN INTERMITTENT SHORT TO GROUND.
- IF OK, CLEAR DTC(s).
- IF DTC RESETS, REPLACE HEATER AND A/C CONTROL.
- IF DTC DOES NOT RESET, SEE "DIAGNOSTIC AIDS."

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C8775

DTC 03

INSIDE (IN-CAR) AIR TEMPERATURE SENSOR CIRCUIT (C68) (CIRCUIT OPEN)

Circuit Description:

The inside air temperature sensor is a thermistor used to control the signal voltage at the H-A/C control. The H-A/C control supplies a reference voltage (about 5 volts) on CKT 734 to the sensor. When the inside air temperature is cold, the thermistor resistance is high; therefore, the H-A/C control will receive a high signal voltage input. If the inside air temperature is hot, the thermistor resistance is low; therefore the H-A/C control will receive a low signal voltage input.

DTC Will Set When:

With ignition in "RUN," a DTC 03 will be set if the resistance seen between CKT 734 and CKT 1791 is above 100.7 k Ω .

Action Taken:

DTC 03 will set in the H-A/C control. With DTC 03 present, the H-A/C control will use a default value of 128 or 24°C (75°F). This can be seen by displaying parameter "-28" for the inside air temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The system will then return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks resistance of inside air temperature sensor.
3. This test checks for normal to above voltage on CKT 734.
4. This test checks for an open in CKT 1791.

Diagnostic Aids:

Visually inspect sensor thermistor element for broken wires or contamination by removing right-hand instrument panel molding.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10324

DTC 04

INSIDE (IN-CAR) AIR TEMPERATURE SENSOR CIRCUIT (C68) (CIRCUIT SHORTED)

Circuit Description

The inside air temperature sensor is a thermistor used to control the signal voltage at the H-A/C control. The H-A/C control supplies a reference voltage (about 5 volts) on CKT 734 to the sensor. When the inside air temperature is cold, the thermistor resistance is high; therefore, the H-A/C control will receive a high signal voltage input. If the inside air temperature is hot, the thermistor resistance is low; therefore the H-A/C control will receive a low signal voltage input.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKT 734 stays at or near 0 volts.

Action Taken:

DTC 04 will set in the H-A/C control. With DTC 03 present, the H-A/C control will use a default value of 128 or 24°C (75°F). This can be seen by displaying parameter "-28" for the inside air temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The system will then return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks resistance of inside air temperature sensor.
3. This test checks for a ground in CKT 734.

Diagnostic Aid:

Visually inspect sensor thermistor element for broken wires or contamination by removing right-hand instrument panel molding.

YES

NO

REPAIR SHORT TO GROUND IN CKT 734.

- CHECK CKT 734 FOR AN INTERMITTENT SHORT TO GROUND.
- IF OK, CLEAR DTC(s).
- IF DTC RESETS, REPLACE H-A/C CONTROL.
- IF DTC DOES NOT RESET, SEE "DIAGNOSTIC AIDS."

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C8777

DTC 05

SUN LOAD TEMPERATURE SENSOR CIRCUIT (C68)

(CIRCUIT OPEN)

Circuit Description:

The sun load sensor is a reverse bias photo diode which measures sun load on the vehicle. In "AUTO" mode, the sensor is an input to the H-A/C control to control air delivery. In bright sunlight, the influence of the sensor is comparable to lowering the guide temperature setting by as much as three degrees. A current DTC 05 will be set if an open exists in the circuit.

DTC Will Set When:

With ignition in "RUN", the H-A/C control will detect this fault anytime that CKT 590 stays at or near 5V or higher.

Action Taken:

DTC 05 will set in the H-A/C control. While the DTC is present, the H-A/C control will use a default value of 240 (readout shows "-140") which is equivalent to no sun load. This can be seen by displaying pointer "-18" for the sun load temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The system will return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks for normal to above voltage on CKT 590.
3. This test checks for an open in CKT 1791.

Diagnostic Aids:

Visually inspect sensor and connector damage by removing grille.

DTC 05 SUN LOAD TEMPERATURE SENSOR CIRCUIT (CIRCUIT OPEN)

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10325

DTC 06 SUN LOAD TEMPERATURE SENSOR CIRCUIT (C68) (CIRCUIT SHORTED)

Circuit Description:

The sun load sensor is a reverse bias photo diode which measures sun load on the vehicle. In "AUTO" mode, the sensor is an input to the H-A/C control to control air delivery. In bright sunlight, the influence of the sensor is comparable to lowering the guide temperature setting by as much as three degrees. A current DTC 06 will be set if a ground exists in the circuit.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKT 590 is at or near zero voltage.

Action Taken:

DTC 06 will set in the H-A/C control. While the DTC is present, the H-A/C control will use a default value of 240 (readout shows "-140") which is equivalent to no sun load. This can be seen by displaying pointer "-18" for the sun load temperature sensor.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired, and the system will return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks for a short to ground in CKT 590.

Diagnostic Aids:

Visually inspect sensor and connector damage by removing grille.

**DTC 06
SUN LOAD TEMPERATURE
SENSOR CIRCUIT
(CIRCUIT SHORTED)**

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10326

DTC 10

AIR MIX MOTOR CIRCUIT (C68) (CIRCUIT OPEN)

Circuit Description:

The electric actuator is driven by the H-A/C control to operate the temperature valve. The position of the temperature valve is adjusted to maintain the set temperature. A feedback potentiometer is used in the electric actuator so that the H-A/C control will know the position of the temperature valve. The feedback potentiometer is part of a flat-pack design motor which is mounted on the rear-facing surface of the heater and air conditioning evaporator module. A low voltage at CKT 1218 (about 1.0 volt) represents a hot air valve position and a high voltage at CKT 1218 (about 4.0 volts) a cold air valve position. The H-A/C control drives the electric actuator motor through CKT 1199 by applying 0-2.5-5 volts through the circuit. Applying 0.0V on CKT 1199 to the logic CKT 1199 will cause the temperature valve to move to the full cold position. Applying 2.5 volts causes the electric actuator to stop moving.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKTs 1217 and 1218 see voltage greater than 4.5 volts.

Action Taken:

DTC 10 will set in the H-A/C control. The ACAC system will use a default value of 128 until the fault is cleared.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The ACAC system will then return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for HVAC DTC(s) and should clear any intermittent DTC(s).
2. This test checks for voltage on CKTs 1217 and 1218.
3. This test checks for an open on CKT 1791.
4. This test checks for feedback voltage at terminal "C8" of the H-A/C control.

Diagnostic Aids:

Check for a binding temperature valve while removing or replacing the actuator. Check for loose connection or bent pins at the electric actuator connector. Operation of the electric actuator may be observed by opening the instrument panel compartment and then changing the H-A/C control temperature setting from full hot to full cold.

If the H-A/C control voltage supply was disconnected, a new actuator was installed or the temperature valve was disturbed, the H-A/C control will have to be re-calibrated. This will prevent a DTC from being set because of a detected difference between the former and present temperature valve positions. To recalibrate the H-A/C control, remove I/P fuse 33, install fuse 33, and turn ignition switch to the "RUN" position.

DTC 10

AIR MIX MOTOR CIRCUIT (CIRCUIT OPEN)

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10327

DTC 11 AIR MIX MOTOR CIRCUIT (C68) (CIRCUIT SHORTED)

Circuit Description:

The electric actuator is driven by the H-A/C control to operate the temperature valve. The position of the temperature valve is adjusted to maintain the set temperature. A feedback potentiometer is used in the electric actuator so that the H-A/C control will know the position of the temperature valve. The feedback potentiometer is part of a flat-pack design motor which is mounted on the rear-facing surface of the heater and air conditioning evaporator module. A low voltage at CKT 1218 (about 1.0 volt) represents a hot air valve position and a high voltage CKT 1218 (about 4.0 volts) a cold air valve position. The H-A/C control drives the electric actuator motor through CKT 1199 by applying 0-2.5-5 volts through the circuit. Applying 0.0V on CKT 1199 to the logic portion causes the temperature valve to move to the full heat position. Applying 5.0V on CKT 1199 will cause the temperature valve to move to the full cold position. Applying 2.5 volts causes the electric actuator to stop moving.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime that CKTs 1217 and 1218 see voltage near or at 0.0V.

Action Taken:

DTC 11 will set in the H-A/C control. The ACAC system will use a default value of 128 until the fault is cleared.

DTC Will Clear When:

This fault will clear as soon as the fault has been repaired. The ACAC system will then return to normal operation.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks for a short to ground in CKTs 1217 and 1218.
2. This test checks for feedback voltage at terminal "C8" of the H-A/C control.

Diagnostic Aids:

Check for a binding temperature valve while replacing the actuator. Check for loose connection or bent pins at the electric actuator connector. Operation of the electric actuator may be observed by opening the instrument panel compartment and then changing the H-A/C control temperature setting from full hot to full cold.

If the H-A/C control voltage supply was disconnected, a new actuator was installed or the temperature valve was disturbed. The H-A/C control will have to be re-calibrated. This will prevent a DTC from being set because of a detected difference between the former and present temperature valve positions. To recalibrate the H-A/C control, remove I/P fuse 33, install fuse 33, and turn ignition switch to the "RUN" position.

DTC 11 AIR MIX MOTOR CIRCUIT (CIRCUIT SHORTED)

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

(CIRCUIT SHORTED TO GROUND, SHORTED TO B+, OPEN)

Looking at the systems on CKT 800 (with a scan tool) and returning to the “HVAC” selection can cause a HVAC DTC 26 to set in the H-A/C control. When diagnosing a HVAC DTC 26, clear the DTC and check for HVAC DTCs again.

DTC 26

SERIAL DATA COMMUNICATION (CIRCUIT SHORTED TO GROUND, SHORTED TO B+, OPEN)

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

C10328

DTC 27

INVALID EEPROM DETECTED (C68)

Circuit Description:

The H-A/C control EEPROM contains the necessary software to run the heating and air conditioning program.

DTC Will Set When:

With ignition in "RUN," the H-A/C control will detect this fault anytime the EEPROM experiences an internal fault.

Action Taken:

DTC 27 will set. The ACAC system can operate in an erratic manner.

DTC Will Clear When:

This fault will clear as soon as the EEPROM internal fault goes away.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

- This test has you clear DTC(s) and recheck for DTC 27.

Diagnostic Aids:

Check connections at H-A/C control connector. Check B+, ignition and ground to the H-A/C control.

DTC 27 INVALID EEPROM DETECTED

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTC(s) AND VERIFY PROPER OPERATION.

ON-VEHICLE SERVICE (C67 and C68)

! Important

- If a service procedure for a specific component or system is not mentioned in this section, refer to SECTION 1B.

ADJUSTMENTS (C68)

Temperature Valve Adjustment

If a new temperature valve has been installed or voltage to the H-A/C control has been disconnected, the H-A/C control must be re-calibrated to assure proper functioning of the valve.

To recalibrate the H-A/C control, remove I/P fuse 33, reinstall fuse 33 and turn ignition switch to the "RUN" position. For fuse location, refer to ELECTRICAL DIAGNOSIS 8A-11. The system will automatically recalibrate.

If the outside temperature is at least 10°C (50°F) and the engine is warmed up to its normal operating temperature, a quick check of overall system performance can be made after the H-A/C control is done re-calibrating. After waiting for 30 seconds with the system in "AUTO" and the temperature set for maximum heating, feel for a strong (high blower motor speed) flow of warm air from the floor outlet before changing the temperature setting.

When the temperature setting is changed to maximum cooling, blower motor speed should diminish momentarily, then increase to high speed again as the shift is completed. During the shift, air should begin to flow from the instrument panel outlets as blower speed decreases. As the blower motor returns again to high speed, the airflow from the floor outlet should stop. If time is available, allow one minute (as opposed to 30 seconds) of operation in the maximum cooling mode. By that time, discharge air temperature at the instrument panel center outlet should be at least 11°C (20°F) lower than outside air temperature.

Before turning off the engine, change the temperature setting to any intermediate number higher than the inside air temperature. The air inlet valve should close as the system shifts out of maximum cooling. Two sounds normally occur to indicate the closing of the air inlet valve; the sound of the valve closing and an apparent reduction in air noise.

If any discrepancies are noted, refer to "Diagnosis" in this section.

REPLACEMENT PROCEDURE (C68)

Sensors (C68)

! Important

- After replacing any sensor, any HVAC Diagnostic Trouble Code (DTC) being displayed by the H-A/C control should be cleared by first pressing the "OFF" switch of the control panel, while displaying DTC(s) in pointer number "-02."

1. Actuator (12).
 - A. Align metal drive sleeve of actuator (12) with flats on temperature valve shaft and press actuator (12) straight forward into position.
 - B. Install two attaching bolts/screws (15).

Tighten

- Bolts/screws (15) to 1.9 N.m (17 lb. in.).
2. Electrical connector to actuator (12).
 3. Instrument panel compartment. Refer to SECTION 8C.
 4. Battery negative cable.

Tighten

- Battery negative cable to 17 N.m (13 lb. ft.).
5. Recalibrate H-A/C control by turning ignition switch to the "RUN" position. The system will automatically recalibrate.

Vacuum Hose Harness (C67 and C68)

Figures 1C-7 and 1C-23

It is not necessary to replace the entire harness in case of a localized leakage or hose collapse. A repair can be made by cutting the hose and inserting a plastic connector.

Remove or Disconnect

1. Disable SIR system. Refer to SECTION 9J.
2. Passenger inflatable restraint module, if access to hose connection at vacuum tank (27) is necessary. Refer to SECTION 9J.
3. Vacuum hose manifold from solenoid (13).
 - Remove manifold by releasing retainers holding it to solenoid (13).
4. Connector (42).
 - Disconnect connector (42) from hose (41).
5. Vacuum hose and connectors at vacuum actuators and tank (27).
 - Disconnect hose end connectors from vacuum tubes of actuators and vacuum tank barbed tubes of sliding plastic retainer tab past bend of L-shaped tube or connector. Then slide connector off tube while continuing to hold tab back against body of the connector.
6. Vacuum hose harness.
 - Remove vacuum hose harness, noting positions and routing of all hoses for reference during installation.

Inspect

- Vacuum hoses for cracks, leaks and collapsed sections. Repair hose or replace harness as required.

Install or Connect

1. Vacuum hose harness.

- Place vacuum hose harness in position as noted during removal. Individual hoses are routed as follows:
 - Black hose to lower fitting of tank (27).
 - Violet hose to upper fitting of tank (27).
 - Orange hose to actuator (9).
 - Blue hose to actuator (11).
 - Gray hose to actuator (11).
 - Red hose to upper fitting of actuator (10).
 - Tan hose to lower fitting of actuator (10).

2. Vacuum hose end connectors.

- Connect hose end connectors by bending retaining tab of plastic connector back flush against end of connector and holding it there while slipping tab and connector onto vacuum tube. When connector is fully seated, pull retaining tab over tube to hold connector in place.

3. Connector (42).

- Connect connector (42) to hose (41).

4. Vacuum hose manifold to solenoid (13).

- Snap manifold into place on bottom of solenoid (13).

5. Passenger inflatable restraint module. Refer to SECTION 9J.

6. Enable SIR system. Refer to SECTION 9J.

Vacuum/Electric Solenoid (C67 and C68)

Figures 1C-22 and 1C-23

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Right hand instrument panel sound insulator. Refer to SECTION 8C.
3. Electrical connector from solenoid (13).
4. Two attaching bolts/screws (77) holding solenoid (13) to evaporator module (1).
5. Solenoid (13) with vacuum hose manifold attached.
6. Vacuum hose manifold from solenoid.
 - Remove manifold by releasing retainers holding it to solenoid (13).

Install or Connect

NOTICE: Refer to "Notice" on page 1C-1 of this section.

1. Vacuum hose manifold to solenoid (13).
 - Snap manifold into place on bottom of solenoid (13).
2. Solenoid (13) and two attaching bolts/screws (77) to evaporator module (1).

Tighten

- Bolts/screws (77) to 1.9 N.m (17 lb. in.).
- 3. Electrical connector to solenoid (13).
- 4. Right hand instrument panel sound insulator.
Refer to SECTION 8C.
- 5. Battery negative cable.

Tighten

- Battery negative cable to 17 N.m (13 lb. ft.).

SECTION 1D2

HD6/HT6 AIR CONDITIONING COMPRESSOR SERVICE OR UNIT REPAIR R-134a

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under ON-VEHICLE SERVICE and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

GENERAL DESCRIPTION

The HD6/HT6 Automotive Conditioning Compressor and Clutch Assembly is a lightweight, six cylinder axial design consisting of three double ended pistons and weighs 5.8 kg (12.7 lbs.).

Fig. 1 Clutch Driver Designs

Although this compressor is the same for all vehicle applications, there are differences in installations, mounting brackets, pulleys, torque cushions and switches, none of which will affect the following overhaul procedures.

There are two clutch driver designs for these compressors. The clutch driver without a torque cushion and the clutch driver having a thin torque cushion (Fig. 1).

Service compressors are supplied with either the control switches assembled in the rear head or a plug may be found where a control switch is required. If the service compressor requires control switches, the plug may be removed from the appropriate rear head switch cavity of the replaced compressor and assembled as prescribed in this manual.

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any "on vehicle" repairs, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with trichloroethane, naphtha, stoddard solvent, kerosene or equivalent and dried with dry air. When necessary to use a cloth on any part, it should be of a non-lint producing type.

The operations described below are based on bench overhaul with the compressor removed from the vehicle, except as noted. They have been prepared in order of accessibility of the components. When a compressor is removed from the vehicle for servicing, the amount of PAG lubricant remaining in the compressor should be drained,

Fig. 2 Compressor Components — Disassembly

measured and recorded. This PAG lubricant should then be discarded and an equal amount of new PAG lubricant added to the compressor.

The service compressor is shipped with 240 ml (8 oz.) of PAG lubricant. This lubricant should be drained and retained for use as replacement lubricant when service procedures require addition of new lubricant to compressor. **NOTE:** Replace only with GM approved PAG oil P/N 12345923.

Most minor repair procedures may be done on the vehicle without discharging the system. Major repair procedures require that the system be discharged of refrigerant.

UNIT REPAIR

MINOR COMPRESSOR REPAIR PROCEDURES

THE FOLLOWING OPERATIONS TO THE COMPRESSOR CLUTCH PLATE AND HUB, ROTOR AND BEARING, AND COIL ARE COVERED AS "MINOR" BECAUSE THEY MAY BE PERFORMED WITHOUT FIRST RECOVERING REFRIGERANT FROM THE SYSTEM OR REMOVING THE COMPRESSOR FROM THE VEHICLE.

The Compressor Shaft Seal assembly, control switches, and Pressure Relief Valve may also be serviced **WITHOUT REMOVING THE** compressor from the vehicle but these operations are covered later in this section as **MAJOR REPAIR PROCEDURES** because the system must be reclaimed, evacuated and recharged to complete service.

Illustrations used in describing these operations show the compressor removed from the vehicle only to more clearly illustrate the various operations.

When servicing the compressor, remove only the parts that preliminary diagnosis shows are in need of service. Refer to Figures 2 and 5 for information relative to part names and location.

Removal and installation of external compressor parts, and disassembly and assembly of internal parts, must be performed on a clean workbench. The work area, tools and parts must be kept clean at all times.

COMPRESSOR CLUTCH PLATE AND HUB ASSEMBLY

Remove or Disconnect

1. Clamp the holding fixture J 33026 in a vise and attach compressor to holding fixture with thumb screws J 33026-1 (Fig. 3).
2. With center screw forcing tip in place to thrust against the end of the shaft, thread the Clutch Plate and Hub Assembly Installer-Remover J 33013-B into the hub. Hold the body of the remover with a wrench and turn the

METRIC THREAD SIZE INFORMATION

1. Compressor to mounting bracket bolts.

3. Compressor shaft.
M9 x 1.25 – 6H
4. Internal hub-clutch drive assembly.
M22 x 1.5 – 6H

center screw into the remover body to remove the clutch plate and hub assembly (Fig. 3).

NOTICE: Do not drive or pound on the clutch hub or shaft. Internal damage to compressor may result. The forcing tip on J 33013-B remover-installer center screw must be flat or the end of the shaft/axial plate assembly will be damaged.

3. Remove the shaft key and retain for reassembly.

Install or Connect

1. Install the shaft key into the hub key groove (Fig. 4). Allow the key to project approximately 3.2mm (1/8") out of the keyway. The shaft key is curved slightly to provide an interference fit in the hub key groove.
2. Be sure the frictional surface of the clutch plate and the clutch rotor are clean before installing the clutch plate and hub assembly.
3. Align the shaft key with the shaft keyway and place the clutch plate and the hub assembly onto the compressor shaft.

Fig. 3 Clutch Plate and Hub Assembly Removal

1D2-4 HD6/HT6 AIR CONDITIONING COMPRESSOR

Fig. 4 Shaft Key, Clutch Plate/Hub Installation

4. Remove the forcing tip on J 33013-B clutch plate and hub assembly installer-remover center screw and reverse the body direction on the center screw, as shown in Figure 5.

5. Install the clutch plate and hub installer-remover J 33013-B with bearing as shown in Figure 8.

The body of the J 33013-B installer-remover should be backed off sufficiently to allow the center screw to be threaded onto the end of the compressor shaft.

6. Hold the center screw with a wrench. Tighten the hex portion of the installer-remover J 33013-B body to press the hub onto the shaft. Tighten the body several turns, remove the installer and **check to see that the shaft key is still in place in the keyway before installing the clutch plate and hub assembly to its final position.** The air gap between frictional surfaces of the clutch plate and clutch rotor should be 0.50-0.76mm (.020-.030").

NOTICE: If the center screw is threaded **fully** onto the end of the compressor shaft, or if the body of the installer is held and the center screw is rotated, the key will wedge and will break the clutch hub.

Fig. 5 Installing Clutch Plate & Hub Assembly

7. Remove installer J 33013-B, check for proper positioning of the shaft key (even or slightly above the clutch hub).
8. Spin the pulley rotor by hand to see that the rotor is not rubbing the clutch drive plate.

COMPRESSOR CLUTCH ROTOR AND/OR BEARING

Remove or Disconnect

1. Remove the clutch plate and hub assembly as described previously.
2. Remove rotor and bearing assembly retaining ring, using snap ring pliers J 6083 (Fig. 6).

Fig. 6 Installing-Removing Pulley Rotor & Bearing Assembly Retaining Ring

Fig. 7 Installing Pulley Rotor/Bearing Puller Guide

Fig. 8 Removing Pulley Rotor and Bearing Assembly

Fig. 9 Pulley Rotor Bearing Removal

3. Install pulley rotor and bearing puller guide J 33023-A to the front head (Fig. 7) and install J 41552 pulley rotor and bearing puller down into the inner circle of slots in the rotor. Turn the J 41552 puller clockwise in the slots in the rotor (Fig. 8).
4. Hold the J 41552 puller in place and tighten the puller screw against the puller guide to remove the pulley rotor and bearing assembly.
5. To prevent damage to the pulley rotor during bearing removal the rotor hub must be properly supported.

Remove the forcing screw from J 41552 puller and, with the puller tangs still engaged in the rotor slots, invert the assembly onto a solid flat surface or blocks as shown in Figure 9.

6. Drive the bearing out of the rotor hub with rotor bearing remover J 9398-A and J 29886 universal handle (Fig. 9).

NOTICE: It is not necessary to remove the staking in front of the bearing to remove the bearing, however, it will be necessary to file away the old stake metal for proper clearance for the new bearing to be installed into the rotor bore or the bearing may be damaged.

1D2-6 HD6/HT6 AIR CONDITIONING COMPRESSOR

Fig. 10 Installing Pulley Rotor Bearing

Install or Connect

1. Place the pulley rotor on the J 21352-A support block to fully support the rotor hub during bearing installation (Fig. 10).

NOTICE: DO NOT support the rotor by resting the pulley rim on a flat surface during the bearing installation or the rotor face will be bent.

2. Align the new bearing squarely with the hub bore and using puller and bearing installer J 9481-A with universal handle J 29886, drive the bearing fully into the hub (Fig. 10). The installer will apply force to the outer race of the bearing, if used as shown.
3. Place bearing staking guide J 33019-1 and bearing staking pin J 33019-2 in the hub bore as shown in Figure 11. Shift the rotor and bearing assembly on the J 21352-A support block to give full support of the hub under the staking pin location. A heavy-duty rubber band may be used to hold the stake pin in the guide (Fig. 11), and the stake pin should be properly positioned in the guide after each impact on the pin.
4. Using care to prevent personal injury, strike the staking pin with a hammer until a metal stake, similar to the original, is formed **down to** but **not touching** the bearing.

Noisy bearing operation and reduced bearing life may result if outer bearing race is deformed while staking. The stake metal should not contact the outer race of the bearing. Stake three places 120 degrees apart as shown in Figure 12.

Fig. 11 Staking Bearing In Rotor Hub Bore

Fig. 12 Bearing Staked in Place

5. With the compressor mounted to the J 33026 holding fixture, position the rotor and bearing assembly on the front head (Fig. 13).
6. Position the J 33017 pulley, rotor and bearing installer and J 33023-A puller pilot directly over the inner race of the bearing (Fig. 13).
7. Position puller crossbar J 8433-1 on the puller pilot J 33023-A and assemble the two J 33026-2 through bolts and washers through the puller bar slots and thread them into the J 33026 holding fixture (Fig. 13). The thread of the through bolts should engage the full thickness of the holding fixture.
8. Tighten the center screw in the J 8433-1 puller crossbar to force the pulley rotor and bearing assembly onto the compressor front head (Fig. 13). Should the J 33017 pulley rotor and bearing installer slip off direct in-line contact with the inner race of the bearing, loosen the J 8433-1 center forcing screw and realign the installer and pilot so that the J 33017 installer will properly clear the front head.
9. Install rotor and bearing assembly retainer ring, using snap ring pliers J 6083 (Fig. 6).
10. Reinstall clutch plate and hub assembly as described previously.

Fig. 13 Installing Pulley Rotor and Bearing Assembly

Fig. 15 Installing Clutch Coil Assembly

Fig. 14 Clutch Coil Assembly Removal

COMPRESSOR CLUTCH COIL

Remove or Disconnect

1. Perform Steps 1 through 4 of "Clutch Rotor and/or Bearings" removal procedure. **Mark clutch coil terminal location on compressor front head.**
2. Install J 33023-A puller pilot on front head of compressor (Fig. 14). Also install J 8433-1 puller crossbar with J 33025 puller legs as shown in Figure 14.
3. Tighten J 8433-3 forcing screw against the puller pilot to remove the clutch coil.

Install or Connect

1. Place the clutch coil assembly on the front head with the terminals positioned at the "marked" location.
2. Place the J 33024 clutch coil installer over the internal opening of the clutch coil housing and align installer with the compressor front head.
3. Center the J 8433-1 puller crossbar in the counter-sunk center hole of the J 33024 clutch coil installer. Install the J 33026-2 through bolts and washers through the crossbar slots and thread them into the holding fixture J 33026 to full fixture thickness (Fig. 15).
4. Turn the center forcing screw of the J 8433-1 puller crossbar to force the clutch coil onto the front head. Be sure clutch coil and J 33024 installer stay "in-line" during installation.

1D2-8 HD6/HT6 AIR CONDITIONING COMPRESSOR

Fig. 16 Staking Clutch Coil to Front Head

Fig. 17 Details of Stakes in Front Head for Clutch Coil

5. When coil is fully seated on the front head, use a 1/8" diameter drift punch and stake the front head at three places 120 degrees apart (Fig. 16), to ensure clutch coil remains in position.
 - Stake size should be only one-half the area of the punch tip and be only approximately 0.28-0.35mm (.010-.015") deep (Fig. 17).
6. Install rotor and bearing assembly and the clutch plate and hub assembly as described previously.

Fig. 18 Compressor Shaft Seal

MAJOR COMPRESSOR REPAIR PROCEDURES

When replacing the shaft seal assembly (Fig. 18), pressure relief valve or control switches (Fig. 19), it will be necessary to recover the refrigerant. Other than clutch repair procedures, the same holds true for any disassembly of the compressor.

A clean workbench covered with a sheet of clean paper, and a place (clean trays, etc.) for all parts being removed and replaced is important, as is the use of proper clean service tools.

NOTICE: Any attempt to use makeshift or inadequate service tools or equipment may result in damage and/or improper compressor operation.

All parts required for servicing the internal compressor are protected by a preservative process and packaged in a manner which will eliminate the necessity of cleaning, washing or flushing of the parts. The parts can be used in the internal assembly just as they are removed from the service package. **Seals and protective packaging should be left intact until just prior to installation.**

If the compressor rear head, front head or cylinder and shaft assembly is to be serviced or replaced, the oil in the compressor must be drained, measured, recorded and replaced.

Fig. 19 Compressor — Rear Head

COMPRESSOR SHAFT SEAL REPLACEMENT

Seal Leak Detection

A shaft seal should not be changed because of small amounts of oil found on an adjacent surface but only after actual refrigerant leakage is found using an approved leak detector, J 39400 or equivalent.

Fig. 20 Removing and Installing Shaft Seal and O-Ring

Remove or Disconnect

1. Recover the refrigerant using J 39500-GM.
2. Loosen and reposition compressor in mounting brackets, if necessary.
3. Remove clutch plate and hub assembly from compressor as described in minor repairs.
4. Remove the shaft seal retainer ring, using snap ring pliers J 5403 (Fig. 21).
5. Thoroughly clean inside of compressor neck area surrounding the shaft, the exposed portion of the seal, the retainer ring groove and the shaft itself. Any dirt or foreign material getting into compressor may cause damage.
6. Fully engage the knurled tangs of Seal Remover-Installer J 23128-A into the recessed portion of the Seal by turning the handle clockwise. Remove the Seal from the compressor with a rotary-pulling motion (Fig. 22). Discard the seal. The handle must be hand-tightened securely. Do not use a wrench or pliers.
7. Remove and discard the seal seat O-ring from the compressor neck using O-ring remover J 9553-01, Figure 20.
8. Recheck the shaft and inside of the compressor neck for dirt or foreign material and be sure these areas are perfectly clean before installing new parts.

Clean

- Thoroughly clean O-ring seal groove in front head.

NOTICE: Seals should not be re-used. Always use a new specification service seal on rebuild (Fig. 18). Be sure that the seal to be installed is not scratched or damaged in anyway. Make sure that the seal seat and seal are free of lint and dirt that could damage the seal surface or prevent sealing.

Install or Connect

1. Dip the new seal seat O-ring in clean 525 viscosity refrigerant oil and assemble onto O-ring installer J 33011, Figure 20.
2. Insert the O-ring installer J 33011 into the compressor neck until the installer "bottoms". Lower the moveable slide of the O-ring installer to release the O-ring into the seal O-ring lower groove. (The compressor neck top groove is for the shaft seal retainer ring.) Rotate the installer to seat the O-ring and remove the installer.
3. Dip the new seal in clean 525 viscosity refrigerant oil and assemble seal to Seal Installer J 23128-A, by turning handle clockwise. The stamped steel case side of the lip seal must be engaged with knurled tangs of installer so that flared-out side of lip seal is facing and installed towards the compressor. Install seal protector J 34614, in the seal lip and place over the compressor shaft, Figure 22, and push the seal in place with a rotary motion or place the seal protector J 34014 over end of compressor shaft, Figure 22, and slide the new

1D2-10 HD6/HT6 AIR CONDITIONING COMPRESSOR

Fig. 21 Removing or Installing Shaft Seal Retaining Ring

seal onto the shaft with a rotary motion until it stops. Take care not to dislodge the O-ring. Be sure the seal makes good contact with the O-ring. Disengage the installer from the seal and remove the installer J 23128-A and the seal protector J 34614.

NOTICE: Handling and care of seal protector is important. If seal protector is nicked or the bottom flared, the new seal may be damaged during installation.

4. Install the new seal retainer ring with its flat side against the Seal, using Snap-Ring Pliers J 5403. See Figure 21. Use the sleeve from O-ring installer J 33011 to press in on the seal retainer ring so that it snaps into its groove.
5. To leak test, install compressor leak test fixture J 39893 on rear head of compressor and connect gage charging lines and J 39500-GM Refrigerant Recovery System. Pressurize suction and high-side of compressor with R-134a Refrigerant. Temporarily install (M9 x 1.25 thread on shaft) nut and, with the compressor in horizontal position, rotate the compressor shaft in normal direction of rotation several turns by hand. Leak test the seal area and correct and leak found. Recover the refrigerant. Remove shaft nut.
6. Remove any excess oil resulting from installing the new seal parts from the shaft and inside the compressor neck.
7. Install the clutch plate and hub assembly as described in minor repair procedures.
8. Reinstall compressor belt and tighten bracket.
9. Evacuate and charge the refrigerant system.

COMPRESSOR PRESSURE RELIEF VALVE

↔ Remove or Disconnect

1. Recover the refrigerant using J 39500-GM.
2. Remove old pressure relief valve (Fig. 19).

→ Install or Connect

1. Clean valve seat area on rear head.
2. Lubricate O-ring of new pressure relief valve and O-ring assembly with new 525 viscosity refrigerant oil. Install new valve and torque in place, 9.0 N•m (6.1 lbs.-ft.)
3. Evacuate and recharge the system.
4. Leak test system.

Fig. 22 Removing or Installing Shaft Seal

CONTROL SWITCHES

Figure 20

Remove or Disconnect

1. Recover the refrigerant.
2. Disconnect the electrical connector from the switch in the rear head of compressor.
3. Remove the switch retaining ring using J 5403 internal snap ring pliers.
4. Remove the switch from the compressor.
5. Remove old O-ring seal from the switch cavity using J 9553-01 O-ring removal tool.

If existing control switch is reinstalled in the compressor, a new O-ring seal must be used and preferably a new retainer ring should also be used. A new switch kit has the O-ring and retainer ring included.

Install or Connect

1. Check switch cavity and O-ring groove in the rear head for dirt or foreign material and clean as necessary. Install a new O-ring coated with clean refrigerant oil into groove in switch cavity.
2. Lubricate the control switch housing with clean refrigerant oil and carefully insert switch into switch cavity until switch bottoms in cavity.
3. Using J 9533-1 snap ring pliers install switch retaining ring with high point of curved sides adjacent to switch housing. Be sure retaining ring is properly seated in switch cavity retaining groove. Leak test according to bench test procedure.

COMPRESSOR LEAK TESTING (EXTERNAL AND INTERNAL)

Bench-Check Procedure

1. Install test plate J 39893 on rear head of compressor.
2. Using J 39500-GM Refrigerant Recovery System, attach center hose of manifold gage set on charging station to a refrigerant drum standing in an upright drum.
3. Connect charging station high and low pressure lines to corresponding fittings on test plate J 39893. Suction port (low-side) of compressor has large internal opening. Discharge port (high-side) has smaller internal opening into compressor and deeper recess.
4. Open low pressure control, high pressure control and refrigerant control on charging station to allow refrigerant vapor to flow into compressor.
5. Using a leak detector, check for leaks at pressure relief valve, rear head switch location, compressor front and rear head seals, center cylinder seal, through bolt head gaskets and compressor shaft seal. After checking, shut off low pressure control and high-pressure control on charging station.

6. If an external leak is present, perform the necessary corrective measures and recheck for leaks to make certain the leak has been corrected.
7. Recover the refrigerant.
8. Disconnect both hoses from the test plate J 39893.
9. Add 90 ml (3 oz.) new PAG lubricant to the compressor assembly. Rotate the complete compressor assembly (not the crankshaft or drive plate hub) slowly several turns to distribute oil to all cylinder and piston areas.
10. Install a M9 x 1.25 threaded nut on the compressor crankshaft if the drive plate and clutch assembly are not installed.
11. Using a box-end wrench or socket and handle, rotate the compressor crankshaft or clutch drive plate on the crankshaft several turns to insure piston assembly to cylinder wall lubrication.
12. Using J 39500-GM Refrigerant Recovery System, connect J 9893 the charging station high-pressure line to the test plate high-side connector.
13. Using J 39500-GM Refrigerant Recovery System, connect the charging station low-pressure line to the low pressure port of the test plate J 39893. Oil will drain out of the compressor suction port if the compressor is positioned with the suction port downward.
14. Attach the compressor to the J 33026 holding fixture and mount the compressor in a vise so that the compressor will be in a horizontal position and the shaft can be turned with a wrench.
15. Using a wrench, rotate the compressor crankshaft or drive plate hub ten complete revolutions at a speed of approximately one-revolution per second. Turning the compressor at less than one-revolution per second can result in a lower pump-up pressure and disqualify a good pumping compressor.
16. Observe the reading on high-pressure gage at the completion of the tenth revolution of the compressor. The pressure reading for a good pumping compressor should be 690 kPa (100 psi) or above. A pressure reading of less than 620 kPa (90 psi) would indicate one or more suction and/or discharge valves leaking an internal leak, or an inoperative valve, and the refrigerant must be recovered and the compressor disassembled and checked for cause of leak. Repair as needed, reassemble and repeat the pump-up test. Externally leak test.
17. When the pressure pump-up test is completed, recover the refrigerant from the high-side and remove the test plate J 39893.
18. Tilt the compressor so that the compressor suction and discharge ports are down. Drain the PAG lubricant from the compressor.
19. Allow the compressor to drain for 10 minutes, then refill with the proper amount of PAG lubricant, per oil balance procedure in section 1B of the service manual. The PAG lubricant may be poured into the suction port. If further assembly or processing is required, a shipping plate or test plate J 39893 should be installed to keep out air, dirt and moisture until the compressor is installed.

STEERING, SUSPENSION, TIRES AND WHEELS DIAGNOSIS

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

Since the problems in steering, suspension, tires and wheels involve several systems, they must all be considered when diagnosing a complaint. To avoid using the wrong symptom, always road test the vehicle first. Proceed with the following preliminary checks and correct any substandard conditions which are found.

Inspect

- Wrong pressure and uneven wear on tires.
- Loose connections or wear on joints from the steering column to the steering gear.

- Loose or damaged parts on the front and rear suspension, steering gear, or steering linkage.
- Out-of-round or out-of-balance tires, damaged wheels.
- Loose and/or rough wheel bearings.
- Power steering fluid level.

The following symptom diagnosis tables may help you find the cause of a problem. The tables list a number of symptoms, along with associated possible causes. More information on any particular listing can be found in the sections referenced in the "Refer To" column.

GENERAL DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Vehicle Pulls or Leads	Misaligned Front Wheels	3A
	Mismatched or Uneven Tires	3E
	Broken or Sagging Spring	3C, 3D
	Radial Tire Lead/Pull	3E
	Unbalanced Steering Gear Spool Valve	3B1A
	Dragging Front Brake	5
Shimmy, Shake or Vibration	Bent Wheel/Excessive Runout	3E
	Out of Balance Wheel	3E
	Excessive Wheel Bolt Runout	3
	Excessive Brake Drum/Rotor Imbalance	5
	Worn Steering Linkage Components	3B3
	Worn Upper or Lower Ball Studs	3C
	Excessive Loaded Radial Runout	3E
	Worn Control Arm Bushings	3C
	Out of Balance Propeller Shaft	4A
Abnormal; Noise at Front End	Improper Drive Line Angle	4A
	Lack of Steering Linkage/Suspension Lubrication	0B
	Damaged Suspension Components	3C
	Front Springs Contacting Frame Pockets	3C
	Broken Stabilizer Shaft Links	3C
	Loose Suspension Nuts or Bolts/Screws	3C, 3D
	Misadjusted Steering Gear	3B1A
	Worn Shock Absorbers	3C, 3D

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
	Scuffed or Cupped Tires	3E
Low or Uneven Trim Height	Broken, Incorrect or Sagging Springs	3C, 3D
	Inoperative ALC System, if equipped	3D1
Body Leans or Sways in Corners	Broken Stabilizer Shaft Links	3C
	Worn Shock Absorbers	3C, 3D
	Broken or Sagging Springs	3C, 3D
Suspension Bottoms	Worn Shock Absorbers	3C, 3D
	Incorrect, Sagging or Broken Springs	3C, 3D
	Inoperative ALC System, if Equipped	3D1
	Missing or Damaged Lower Control Arm Bumper	3C
"Dog Tracking"	Damaged Lower Control Arm	3D
	Bent Rear Axle	4B
	Bent Frame	10-3

TIRES AND WHEELS DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Excessive Tire Wear	Misalignment	3A
	Hard Driving	-
	Overloaded Vehicle	-
	Tires Not Rotated	3E
	Low or Excessive Tire Pressure	0B
Wheel Tramp (Bounce)	Out of Balance Wheel	3E
	Worn Shock Absorbers	3C
	Bump or Broken Belt on Tire	3E
Cupped Tires	Wheel Alignment	3A
	Worn Shock Absorbers	3C
	Loose Wheel Bearings	3C
	Worn Control Arm Ball Studs	3C

STEERING DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Poor Returnability	Incorrect Caster Setting	3A
	Lack of Lubrication	0B
	Bind in Steering Column	3F5A or 3F5B
	Misadjusted Steering Gear	3B1A
	Binding Steering/Suspension Components	3B3, 3C
Hard Steering	Hydraulic System Failure	Perform "Steering System Test Procedure" in this section.
	Misadjusted Steering Gear	3B1A
	Excessive Caster	3A
	Variable Effort Steering System	3B5
Too Much Play in Steering	Worn relay Rod or Idler Arm	3B3
	Misadjusted Steering Gear	3B1A
	Loose Stering Gear Mounting	3B
Wander or Poor Stability	Wheel Alignment	3A
	Lack of Steering/Suspension Lubrication	0B
	Worn Shock Absorbers	3C
	Broken or Sagging Spring	3, 3C
Erratic Steering When Braking	Warped Brake Rotor	5B1
	Worn or Loose Wheel Bearings	3C
	Sticking Brake Caliper Piston	5B1
	Worn Steering/Suspension Components	3B3, 3C
Steering Wheel Kick Back	Worn Steering Dampener (if Equipped)	3B3
	Loose Column-to-Gear Connections	3F
	Air in Power Steering System	3B
	Worn Tie Rod Ends	3B3
	Loose Steering Gear Mounting	3B
Steering Wheel Surges or Jerks	Broken Belt in Tire	3E
	Sluggish Steering Gear Spool Valve	3B1A
	Loose or Oil Soaked Drive Belt	6A4A
	Variable Effort Steering System Malfunction	3B5
	Air in Power Steering System	3B

RIDE DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Ride Too Soft(Vehicles With FE1 Suspension are Designed to Ride Soft)	Incorrect Shock Absorbers	3C
	Incorrect Springs	3C, 3D
Ride Too Harsh	Overinflated Tires	0B
	Malfunctioning ALC System	3D1
	Incorrect Springs	3C
	Incorrect Shock Absorbers	3C

POWER STEERING GEAR DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Hissing Noise	Some Noise May Be Heard While Manouvering When the Vehicle is not Moving. This is Normal	Refer to "Power Steering Pump Diagnosis" for More Information
Rattle or Chucking Noise	Outlet (Pressure) Hose (Metal Portion) Contacting Frame	3B
	Loose Tie Rod End	3B3
	Loose Steering Gear Attachment	3B
	Loose Pitman Shaft	3B
Momentary High Effort When Turning Wheel Quickly	Internal Pressure Leak	3
	Sticking or Damaged Steering Gear Spool Valve	3B1A
	Insufficient Pump Pressure	3
	Low Fluid Level	3B
	Refer to "Steering Diagnosis" for More Information	

POWER STEERING PUMP DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Foamy, Milky Fluid	System not Bled After Service	3B
	Air Injested Due to Low Fluid	3B
	Internal Pump Leakage	3B1B
Low Pressure Due To Pump	Stuck or Inoperative Flow Control Valve	3B
	Vanes Sticking in Rotor	3B1B

3-6 STEERING, SUSPENSION, TIRES AND WHEELS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Growling Noise From Pump	Cracked/Broken Thrust or Pressure Plate	3B1B
	Variable Effort Steering Actuator Sticking	3B5
	Restricted Inlet (Pressure) Hose	3B
	Scored Thrust Plate, Pressure Plate or Rotor	3B1B
	Loose Pump Mounting	3B
	Damaged Pump Shaft Bearing	3B1B

STEERING COLUMN DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Steering Column Will Not Unlock	Damaged Lock Cylinder	3F, 3F5A, 3F5B
	Damaged Lock Bolt	3F, 3F5A, 3F5B
	Damaged Rack or Sector	3F, 3F5A, 3F5B
	Damaged/Incorrect Key	3F, 3F5A, 3F5B
Steering Column Will Not Lock	Broken Lock Bolt Spring	3F5A, 3F5B
	Damaged Rack or Sector	3F5A, 3F5B
	Damaged Lock Cylinder	3F, 3F5A, 3F5B
	Improper Shift Linkage Adjustment	7A
	Park/Lock Cable Misadjusted (Floor Shift)	7A
	Stuck Ignition Switch	3F
	Incorrectly Installed Sector	3F5A, 3F5B
Sticks In "START"	Deformed Actuator Rod	3F5A, 3F5B
	Distorted Rack	3F5A, 3F5B
Key Can Not Be Removed In "LOCK"	Misadjusted Ignition Switch	3F
	Damaged Lock Cylinder	3F5A, 3F5B
	Misadjusted Shift Linkage	7A
	Misadjusted Park Lock Cable	7A
High Lock Effort	Damaged Lock Cylinder	3F5A, 3F5B
	Damaged Ignition Switch	3F
	Broken/Deformed Rack Preload Spring	3F5A, 3F5B
	Burrs on Sector, Rack, Housing or Support	3F5A, 3F5B
	Bent Sector Shaft	3F5A, 3F5B
	Bent Actuator Rod	3F5A, 3F5B
	Bent Ignition Switch Mounting Bracket	3F5A, 3F5B
	Improper Shift Linkage Adjustment	7A

SYMPTOM	POSSIBLE CAUSE	REFER TO (SECTION)
Noise In Steering Column	Loose Steering Column-to-Gear Connections	3F
	Lack of Lubrication on Bearings	3F5A, 3F5B
	Worn/Damaged Steering Shaft Lower Bearing	3F5A, 3F5B
	Unseated Lock Plate Retainer Ring	3F5A, 3F5B
	Unlubricated Spherical Joint	3F5A, 3F5B
High Steering Shaft Rotating Effort	Misaligned Steering Column	3F
	Damaged Upper or Lower Bearing	3F5A, 3F5B
	Tight Intermediate Shaft Coupling	3F
High Shift Effort	Improper Bolts/Screws Used on Ignition Switch	3F
	Damaged/Restricted Shift Tube (Column Shift)	3F5A
	Incorrectly Assembled Lower Bearing	3F5A
Lash in Steering Column	Loose Housing Support Bolts/Screws	3F5A, 3F5B
	Broken Weld Nuts on Jacket	3F5A, 3F5B
	Loose Tilt Shoes/Broken Tilt Spring	3F5A, 3F5B
	Loose Pivot Pin(s)	3F5A, 3F5B
	Loose Housing Support Bolts/Screws	3F
Housing Scraping Bowl	Bent Bowl or Bowl Not Concentric	3F5A, 3F5B
	Improperly Installed Shroud	3F5A, 3F5B
Loose Steering Wheel	Loose Pivot Pin(s)	3F5A, 3F5B
	Upper Bearing Not Seated/Missing Spring	3F5A, 3F5B
	Loose Housing Support Bolts/Screws	3F5A, 3F5B
Loose Steering Wheel (Every Other Tilt Position)	Loose Fit Between Tilt Shoes and Pivot Pins	3F5A, 3F5B

POWER STEERING GEAR AND PUMP LEAK DIAGNOSIS

Preliminary Inspection

Inspect

- Fluid level and condition.
 - If fluid reservoir is empty, avoid running vehicle. Prolong useage without fluid will damage pump.
 - Fluid other than what is recommended (refer to SECTION 0B) can damage seals, i.e. transmission fluid, brake fluid, engine oil. If this has happened, a complete disassembly, cleaning and inspection of both the pump and gear may be required.
- Hoses and lines for cuts, loose clamps, loose fittings at pump or gear.

Clean

- If leak is not obivous, clean all suspected areas throughly before inspecting.
 - Point from which fluid is dripping is not necessarily point where system is leaking. It is important to identify exact point of leakage.
- Identify exact point of leakage. Refer to "External Leakage Check" in this section.

EXTERNAL LEAKAGE CHECK

Figure 1

This procedure will help identify exact location of leak. Some leaks can easily be located, but seepage type leaks may be more difficult. To locate seepage leaks, use the following method:

NOTICE: Refer to "Notice" on page 3-1 of this section.

POWER STEERING GEAR AND PUMP ASSEMBLIES LEAK DIAGNOSIS

- 1 REPLACE O-RING SEAL, AND CHECK RESERVOIR FOR DAMAGE.
- 2 TORQUE INLET HOSE FITTING TO 27 N·m (20 LB. FT.). IF LEAKAGE PERSISTS, REPLACE O-RING SEAL.
- 3 TORQUE UNION FITTING TO 75 N·m (55 LB. FT.). IF LEAKAGE CONTINUES, REPLACE O-RING SEAL.
- 4 SEAT BALL IN HOUSING WITH BLUNT PUNCH. FOLLOW MANUFACTURER'S DIRECTION AND APPLY LOCTITE 75559 SOLVENT AND LOCTITE 290 ADHESIVE, OR EQUIVALENT TO AREA. (THIS ALSO APPLIES TO THE OTHER BALL, LOCATED NEAR THE OPPOSITE END OF THE VALVE ASSEMBLY HOUSING).
- 5 REPLACE DRIVESHAFT SEAL. BE SURE DRIVESHAFT SEAL IS CLEAN AND FREE OF PITTING IN SEAL AREA.
- 6 REPLACE O-RING SEAL.
- 7 TORQUE STEERING GEAR PITMAN SHAFT ADJUST NUT TO 49 N·m (36 LB. FT.). REPLACE STEERING GEAR PITMAN SHAFT ADJUST NUT IF LEAKAGE PERSISTS.
- 8 TORQUE STEERING GEAR HOUSING COVER BOLT/SCREW TO 60 N·m (44 LB. FT.). REPLACE STEERING GEAR HOUSING COVER GASKET IF LEAKAGE PERSISTS.
- 9 REPLACE STEERING GEAR HOUSING COVER (O-RING) SEAL.
- 10 TORQUE POWER STEERING GEAR PIPE FITTING SEAT TO 28 N·m (21 LB. FT.). IF LEAKAGE PERSISTS, REPLACE POWER STEERING GEAR PIPE FITTING (O-RING) SEAL.
- 11 REPLACE STEERING GEAR VALVE BODY.
- 12 SEAT STEERING GEAR BALL FLUSH WITH PUNCH AND RESTAKE. IF SEEPAGE PERSISTS, REPLACE STEERING GEAR HOUSING.
- 13 REPLACE STEERING GEAR STUB SHAFT ADJUST (O-RING) SEALS.
- 14 REPLACE STEERING GEAR PITMAN SHAFT SEALS.
- 15 REPLACE STEERING GEAR HOUSING PLUG (O-RING) SEAL.

3-24-94
BS0013

Figure 1 - Power Steering Gear and Pump Leak Diagnosis

3-10 STEERING, SUSPENSION, TIRES AND WHEELS

1. With engine off, wipe dry complete power steering system.
2. Check fluid level in reservoir and adjust as necessary. If reservoir is empty, system will have to be bled. Refer to SECTION 3B for procedure.
3. Start engine, then turn steering wheel from stop to stop several times.
 - Do not hold it at a stop for any length of time as this can damage pump.
 - It is easier for someone else to operate steering wheel while you search for seepage.
4. Find exact location of leak and repair.

SEAL REPLACEMENT RECOMMENDATIONS

Lip seals, which seal rotating shafts, require special treatment. Lip seals are used on the steering gear and on the pump drive shaft. When a leak is in one of these areas, always replace the seal(s) after inspecting and thoroughly cleaning the sealing surfaces. Replace the shaft only if very severe pitting is found. If the corrosion in the lip seal contact zone is slight, clean the surface of the shaft with crocus cloth. Replace the shaft only if the leakage cannot be stopped by first smoothing with crocus cloth.

POWER STEERING SYSTEM TEST PROCEDURE

Figure 2

Tools Required:

- J 5176-E Power Steering Pressure Tester 0-2000 PSI and
- J 5176-92 18 mm Power Steering Pressure Tester Adapter

If a hydraulic or mechanical malfunction of the pump or power steering gear is suspected, perform the following procedure to determine the cause.

NOTICE: Refer to "Notice" on page 3-1 of this section.

1. Remove brake pressure modulator valve bracket bolts/screws and nut and support unit to provide access to steering gear hose attachment.
 - Do not disconnect any brake lines.
2. Disconnect steering gear inlet (pressure) hose at gear. Use a small container to catch any fluid which might leak.
3. Connect pressure gage J 5176-E to gear inlet (pressure) hose and use adapter J 5176-92 to connect pressure gage to steering gear.
 - The power steering system may be tested using J 5176-E as described here. It can also be tested with available tool J 25325 power steering analyzer which will also measure flow rate.
4. Open valve on J 5176-E.

Figure 2 - Power Steering Pressure Gage

CAUTION: After connecting J 5176-E, ensure hoses do not contact serpentine belt or any pulleys. Personal injury may result.

5. Bleed power steering system. Refer to SECTION 3B.
6. Start engine and allow engine to reach normal operating temperature.
7. With engine at idle and valve open on J 5176-E, pressure should be no more than 1 034 kPa (150 psi).
 - If pressure is more than 1 034 kPa (150 psi), check the hoses and pipes for restrictions or kinks, and check valve on steering gear inlet hose fitting for proper operation and/or restriction. If O.K., steering gear is restricted internally. Refer to SECTION 3B1A for unit repair information.

NOTICE: Do not leave the valve fully closed for more than 5 seconds as the pump could be damaged.

8. Close valve on J 5176-E three times and record pressure reading each time. Each reading should show at least 6 895 kPa (1,000 psi). The three readings should be within 345 kPa (50 psi) of each other.
 - If pressure readings are high enough and are within 345 kPa (50 psi) of each other, pump is functioning properly.
 - If pressure readings are high enough but are not within 345 kPa (50 psi) of each other, control valve in pump is sticking.
 - A. Remove valve, clean it and remove any burrs using crocus cloth or fine hone.
 - B. If system contains some contamination, flush it.
 - If pressure readings are less than 6 895 kPa (1,000 psi), replace flow control valve and recheck.
 - If pressures are still low, repair or replace power steering pump.

9. If pump checks to specification, leave valve open and turn steering wheel (or have someone else turn it) to both stops.
 - Record highest pressures and compare with highest pump pressure recorded earlier.
 - If pressure at both stops is not same as maximum pressure, steering gear is leaking internally and must be repaired.
10. Turn off engine.
11. Remove J 5176-E and J 5176-92.
12. Connect steering gear inlet (pressure) hose to steering gear.

**Tighten**

- Steering gear inlet hose fitting nut to 28 N.m (21 lb. ft.).
13. Position brake pressure modulator valve and install bolts/screws and nut.

**Tighten**

- Brake pressure modulator valve bolts/screws and nut to 24 N.m (18 lb. ft.).
14. Bleed power steering system. Refer to SECTION 3B.

SHOCK ABSORBERS**ON-VEHICLE CHECKS****Weak**

1. Check and adjust tire pressures to pressures shown on tire placard.
2. Note load conditions under which vehicle is normally driven. If vehicle is normally overloaded, shock absorbers will wear out much sooner than normal.
3. Road test vehicle to verify problem.
4. Test each shock absorber in turn by quickly pushing down, then lifting up corner of the bumper nearest the shock absorber being checked.
 - A. Use same amount of effort on each test and note resistance on compression and rebound.
 - B. If possible compare this with a similar vehicle having acceptable ride quality. Both vehicles should provide the same feeling of resistance.
 - C. Shock absorbers should have most of the resistance on rebound, if bumper is jounced then released, bumper should not rebound more than once.
 - If there is much difference between the shock absorbers of the two vehicles, or rebounds more than once, replace the shock absorbers in pairs (front or rear)

Noisy

1. Check all mountings for proper tightening.
2. If all mountings are intact, jounce vehicle as in step 4 in "Weak" above to isolate suspected unit.
3. Replace shock absorber if detected noise is any sound other than hissing.

Leaks

1. Fully extend shock absorbers (wheels unsupported) to fully expose shock absorber for inspection.
2. Look for signs of leaks in seal cover area for front shocks and around base of boot for rear shock.
 - Slight trace of fluid is not cause for replacement. The seal permits some seepage to lubricate the piston rod and there is a built-in fluid reserve to allow for seepage.
 - A leaking shock absorber can easily be found because there will be fluid around seal cover and an excessive amount of fluid on shock absorber.
3. A leaking shock absorber must be replaced.

TIRES**Irregular or Premature Wear****Figures 3 and 4**

Irregular or premature tire wear has many causes. Some of them are: incorrect inflation pressures, lack of regular rotation, driving habits, or improper wheel alignment. If wheel alignment is reset due to a tire wear condition, always reset toe to zero degrees.

**Inspect**

1. Front and rear tire wear. Rotate tires if:
 - Uneven wear exists across tread of any tire.
 - Left and right front tire wear is unequal.
 - Left and right rear tire wear is unequal.
 - Scheduled maintenance interval. Refer to SECTION 0B.
2. Wheel alignment if following conditions are noted:
 - Left and right front tire wear is unequal.
 - Wear is uneven across tread of any front tire.

Figure 3 - Tread Wear Indicators

3-12 STEERING, SUSPENSION, TIRES AND WHEELS

Figure 4 - Tire Wear Diagnosis

- Front tire treads have a scuffed appearance with “feather” edges on one side of tread ribs or blocks.

Tread Wear Indicators

Figure 3

The original equipment tires have built-in tread wear indicators to show when the tires should be replaced. These indicators will appear as 12.7 mm (1/2 inch) wide bands when the tire tread depth becomes 1.6 mm (1/16 inch). When the indicators appear in 2 or more grooves at 3 locations, replace the tire.

Tire Waddle Complaint

Figure 5

Tire waddle is side-to-side movement at the front and/or rear of the vehicle. It can be caused by the steel belt not being straight within the tire (broken belt); or by excessive lateral runout of the tire or

Figure 5 - Tire Waddle

wheel. It is most noticeable at low speed, about 8 to 48 km/h (5 to 30 mph). It may also appear as a ride roughness at 80 to 113 km/h (50 to 70 mph).

Inspect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Perform a preliminary inspection by rotating each tire and wheel by hand.
 - A broken or shifted belt will appear as a twist or bump in the tread.
3. If the problem has not been identified, perform a runout check. Refer to “Runout Check” in this section.
4. If problem has not been identified, a tire substitution may be used to identify the faulty tire and wheel.
 - Use the spare tire to replace each tire, one at a time, while test driving the vehicle. The problem will be eliminated when the faulty tire is removed from the vehicle.

Radial Tire Lead/Pull

Lead/pull is the deviation of the vehicle from a straight path, on a level road with no pressure on the steering wheel. Lead/pull is usually caused by:

- Poor tire construction.
- Improper wheel alignment.
- Brake caliper not fully releasing.

The way in which a tire is built can produce lead in a vehicle. An example of this is placement of the belt. Off-center belts on radial tires can cause the tire to develop a side force while rolling straight down the road and the tire will tend to roll like a cone.

Refer to the lead/pull correction chart to determine cause of lead/pull.

Vibration

Figure 7

A vibration is considered a shake or shimmy at higher speeds than a tire waddle. If problem is noticed at low speeds (8 to 48 km/h (5 to 30 mph)), refer to “Tire Waddle Complaint” in this section.

Before performing diagnosis, perform the following preliminary inspections:

3-14 STEERING, SUSPENSION, TIRES AND WHEELS

Inspect

- Tire inflation pressure.
- Damaged rims from chuckhole or curb impact.
- Tires for tread distortions, separations, bulges, or mixed sizes.
 - Slight sidewall indentations are normal and will not affect ride.
 - Sidewall bulges are not normal and indicate impact damage.
- Mud or tar build-up on tire or wheel.
- Loose or missing balance weights or wheel nuts.
- Irregular or excessive tire wear.
- Bent drive shaft or worn universal joints.

Refer to vibration diagnosis chart to determine cause of vibration.

Tire and Wheel Balance

Before removing the tire and wheel from the vehicle, mark the wheel bolt nearest the valve stem for future reference. Also mark the vehicle position (left front, etc.) on each tire. Balance is the easiest procedure to perform and should be done first if the vibration occurs at highway speeds. An off-vehicle, two-plane dynamic balance should be performed first. This will correct any imbalance in the tire and wheel.

An on-vehicle finish balance may also be required. This may offset brake drum and rotor imbalance. If balance does not correct the highway speed vibration, or if the vibration occurs at low speeds, tire or wheel runout may be the probable cause. Refer to "Runout Check" in this section.

Runout Check

This procedure may be stopped at whatever point the acceptable level of runout is reached.

Measure

1. Free runout of tire and wheel on vehicle using a dial indicator with a roller wheel.
 - Lateral runout (side to side) should be measured on tire's sidewall as close to tread shoulder as possible.
 - Radial runout (up and down) should be measured on center tread rib.

— Some tread designs may require wrapping a piece of tape tightly around center tread circumference for better dial indicator contact.

- Disregard any instantaneous indicator needle jumps due to sidewall depressions, tread blocks, etc.

2. Record total indicator reading, and location of high point of runout.
3. If radial or lateral runout exceeds 1.27 mm (0.050 inch), mount tire and wheel on a dynamic balance machine and remeasure runout.
 - Make sure wheel is centered on machine by wheel center pilot hole.
4. Record total indicator reading, and location of the high point of runout.
5. If radial or lateral runout exceeds 1.27 mm (0.050 inch), break down and rotate tire on rim 180 degrees.

- In many cases, rotating tire on wheel will bring runout to an acceptable range.
- Whenever a tire is rotated on the wheel, in this way, the must be rebalanced.

6. Reinflate, mount on dynamic balance machine and remeasure runout.
7. Record total indicator reading and location of high point of runout.
8. If radial or lateral runout still exceeds 1.27 mm (0.050 inch) and high point has moved approximately 180 degrees, following tire around rim, tire is faulty and should be replaced.
9. If second high point still exceeds 1.27 mm (0.050 inch) and is close to original high point, relative to the rim, runout of the wheel should be checked.

- Replace wheel if radial or lateral runout of wheel exceeds:
 - Aluminum wheel - 0.76 mm (0.030 inch).
 - Steel Wheel - 1.14 mm (0.045 inch).

10. If runout of tire and wheel is within limits when measured off the vehicle, yet exceeds the limits when measured on the vehicle, the attachment of tire and wheel to hub is probable cause.

- A. Clean mounting surface and check for any debris, rust or corrosion on mounting surface.
- B. If problem can not be corrected by cleaning mounting surface, replace rotor or axle shaft.

DS0023

Figure 7 - Tapered Roller Bearing Diagnosis

3-16 STEERING, SUSPENSION, TIRES AND WHEELS

Substitution method

Install a known good set of tires and wheels. If these correct the vibration, the original tires and wheels should be reinstalled one at a time until the vibration returns. This can also be done using the spare tire, substituting one tire at a time until the problem is eliminated.

TAPERED ROLLER BEARING DIAGNOSIS

Bearing noises are normally a grinding or rumbling noise heard at all speeds. The noise may become louder or quieter when the steering wheel is turned slightly to either side (this transfers some of the load from one bearing to the other (inner bearing-to-outer bearing, or outer bearing-to-inner bearing). Tapered roller bearings are used only on the front wheels, if noise is coming from the rear axle, refer to SECTION 4B.

Remove or Disconnect

1. Front brake rotor. Refer to SECTION 3C.
2. Inner wheel bearing and seal from front brake rotor.
 - Pry out seal from rotor, then remove inner bearing.

Inspect

- Grease surrounding inner and outer bearings. If any metal chips are noticed, both inner and outer bearings and races must be replaced. Refer to SECTION 3C for procedure.

Clean

- All grease from the front brake rotor, and spindle, and thoroughly clean out any grease in the inner and outer bearings. Use clean solvent. Use a small brush with no loose bristles to clean out all old grease.

NOTICE: Do not spin the inner and outer bearings with compressed air while drying or the bearings may be damaged.

Inspect

- Bearings and races for condition and color. Compare with the following charts.
- Spindle for roughness or damage on the bearing mating surfaces. Bearings must "creep" on spindle surface. If surface is damaged, the spindle must be replaced.

TAPERED ROLLER BEARING DIAGNOSIS

CONDITION	CAUSE	REPAIR PROCEDURE
Bent Cage	Damage due to improper handling or tool usage.	Replace bearing.
Galling	Metal smears on roller ends due to overheating. Lubricant failure or overload.	Replace bearing. Check inner bearing seal.
Abrasive Step Wear	Pattern on roller ends caused by fine abrasives.	Clean all parts. Replace bearings and seal.
Etching	Bearing surfaces appear gray or grayish black in color with related etching away of material usually at roller spacing.	Replace bearings. Check inner bearing seal for damage. Replace seal if necessary.
Misalignment	Outer race misalignment due to a foreign object	Clean related parts and replace bearing. Make sure races are properly seated.
Indentations	Surface depressions on race and rollers caused by hard particles of foreign material.	Clean all parts and housing. Check inner bearing seal and replace bearings.
Fatigue Spalling	Flaking of surface metal resulting from fatigue.	Replace bearings. Clean all related parts.
Brinelling	Surface indentations in raceway caused by rollers either under impact loading or vibration while bearing is not rotating.	Replace bearing.
Cage Wear	Wear around outside diameter of cage and roller pockets caused by abrasive material and insufficient lubrication.	Replace bearings. Check inner bearing seal.

TAPERED ROLLER BEARING DIAGNOSIS (cont'd)

CONDITION	CAUSE	REPAIR PROCEDURE
Abrasive Roller Wear	Pattern on races and rollers caused by fine abrasives.	Clean all parts and housings. Check inner bearing seals and bearings. Replace if leaking, rough, or noisy.
Cracked Inner Race	Race cracked due to improper fit, cocking, or poor bearing seats.	Replace inner race.
Smears	Smearing of metal due to excessive slippage. Excessive slippage can be caused by poor fits, poor lubrication, overheating, overloads, or handling damage.	Replace bearings. Clean related parts and check for proper fit on spindle. Replace spindle if damaged.
Fretting	Corrosion set up by small relative movement of parts with no lubrication.	Replace bearings. Clean related parts. Check inner bearing seal.
Heat Discoloration	Discoloration can range from faint yellow to dark blue and can result from overload or incorrect lubricant, and overheating. Excessive heat can cause softening of the races on rollers	Replace bearings and inner seal if overheating damage is indicated.
Stain Discoloration	Discoloration can range from light brown to black and can be caused by incorrect lubricant or moisture.	Reuse bearings if stains can be removed by cleaning and if there is no evidence of overheating. Check inner bearing seal.

T5589(Cont'd)

TRIM HEIGHT

Figures 8 and 9

Incorrect trim heights can cause bottoming out over bumps, possible damage to suspension components and symptoms similar to those produced when there is a problem with the wheel alignment. Trim heights should be checked when diagnosing suspension complaints and before checking wheel alignment.

Before measuring trim heights perform the following:

1. Set tire pressures to pressure shown on tire placard (located on rear of drivers door).
2. Check fuel level, add additional weight, if necessary to simulate a "full tank".
3. Place front seats in the full back position, second seat in upward position, and third seat down.
4. Make sure the rear compartment is empty except for spare tire and jack and simulated fuel load
5. Make sure vehicle is on a level surface (such as an alignment rack).
6. All doors, hood and rear compartment lid or tailgate are closed.

All dimensions shown on Figures 8 and 9 are measured vertical to the ground. Trim heights should be within 10 mm (0.4 inch) to be considered correct.

Measuring "Z," "J" and "P" Dimensions

1. Lift front bumper of vehicle up approximately 38 mm (1 1/2 inches). Gently remove hands and let vehicle settle.
2. Push front bumper down approximately 38 mm (1 1/2 inches). Gently remove hands and let vehicle rise on its own.
3. Measure "Z," "J" and "P" dimensions and calculate trim heights.
 - Trim heights are average of high and low measurements.
4. Verify trim heights with Figures 8 or 9.
5. To correct front trim heights, the front springs must be replaced.

Measuring "D," "K" and "R" Dimensions

Repeat procedure as described for "Measuring "Z," "J" and "P" Dimensions" using the rear bumper and measuring "D," "K" and "R" at the appropriate times. Automatic level control system must be operative while taking measurements. Trim height adjustments can be made by adjusting the automatic level control height sensor, if equipped or replacing springs.

SECTION 3A

WHEEL ALIGNMENT

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in SECTION 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location View in Section 9J before performing service on or around SIR Components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

Wheel alignment refers to the angular relationship between the wheels, the suspension attaching parts, and the ground.

CASTER

Caster is the tilting of the front steering axis (at the top) either forward or backward from the vertical. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect tire wear and is adjustable only at the front wheels. Caster is affected by vehicle height, therefore it is important to keep the body at its designed height. Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster. For trim height information, refer to SECTION 3.

CAMBER

Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When the wheels tilt outward at the top, the camber is

positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt is measured in degrees from the vertical. Camber setting influences directional control and tire wear.

TOE

Toe is a measurement of how much the front wheels are turned in or out from a straight-ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. The purpose of toe is to ensure that the wheels roll parallel. Toe also serves to offset the small deflections of the wheel support system which occur when the vehicle is rolling forward. In other words, even when the wheels are set to toe in slightly when the vehicle is standing still, they tend to roll parallel on the road when the vehicle is moving. Toe affects tire wear.

THRUST ANGLE

The wheels aim or steer the vehicle, but the rear wheels control tracking. This tracking action is relative to thrust angle. Thrust angle is defined as the path that the rear wheels will take. Ideally, the thrust angle is geometrically aligned with the body centerline.

3A-2 WHEEL ALIGNMENT

PRELIMINARY INSPECTIONS

Steering and vibration complaints are not always the result of improper alignment. Another possibility is tire "lead" due to worn or improperly manufactured tires. "Lead" is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to SECTION 3 for the procedure to determine if the vehicle has a tire lead problem. Before making any adjustment affecting wheel alignment, make the following inspections to ensure correct alignment readings and alignment adjustments.

Inspect

- All tires for proper inflation pressures. Also check that all tires have about the same tread wear.
- Wheel bearings for proper adjustment and correct if necessary.
- Control arm ball studs, relay rod and tie rod ends. If they are loose, correct them before adjusting wheel alignment. Refer to SECTION 3B3 and 3C.
- Runout of wheels. Refer to SECTION 3.
- Vehicle trim height. If out of limits and a correction is to be made, do so before adjusting wheel alignment. Refer to SECTION 3 for trim height chart.
- Steering gear loose at frame.
- Control arms for loose bushings.
- Stabilizer shafts for loose or missing parts.
- Leaking or worn out shock absorbers.
- Remaining suspension and steering components for damage. All worn parts **must** be replaced prior to adjusting wheel alignment.
- Vehicle for stability. The fuel tank should be full, or the vehicle should have compensating ballast.
- Jounce front and rear of vehicle lightly three times.

Consideration must be given to excess loads, such as tool boxes, sample cases, etc. If these items are normally carried in the vehicle, they should remain in the vehicle during alignment adjustments. Consideration should also be given to the condition of the equipment being used to adjust alignment. Be sure to follow the equipment manufacturer's instructions. Regardless of the equipment used to adjust alignment, the vehicle must be on a level surface, both front-to-rear and side-to-side.

ON-VEHICLE SERVICE

MEASURING FRONT ALIGNMENT ANGLES

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, should the settings vary beyond the specifications shown at the end of this section, the alignment angles should be corrected. Perform preliminary inspections prior to measuring alignment angles or inaccurate reading may result.

Measure

- Front alignment angles.
 - a. Install alignment equipment according to the manufacturer's instructions.
 - b. Jounce the front and rear bumpers lightly three times to normalize suspension prior to measuring angles.
 - c. Measure alignment angles and record the readings. If adjustments are required, make them in the following order: caster, camber, and toe.

FRONT CASTER AND CAMBER ADJUSTMENT

Figures 1 and 3

Caster and camber adjustments are made by inserting shims between the control arm pivot shaft and the frame. Shims may be added, subtracted or transferred to change the readings as follows:

1. Caster - Transfer shims, front-to-rear or rear-to-front.
 - Example: The transfer of one shim from the control arm pivot shaft rear bolt/screw to the control arm pivot shaft front bolt/screw will decrease positive caster.
2. Camber - Add or subtract shims at both the front and rear of the control arm pivot shaft.
 - Example: Adding an equal number of shims at both the front and rear of the control arm pivot shaft will decrease positive camber.

Caster and camber can be adjusted in one operation. Toe must be checked after changing camber or caster.

Adjust

- Front caster and camber.
1. Jounce the front bumper three times before making any adjustment in the caster to allow the vehicle to return to its normal height.
 2. Loosen the control arm pivot shaft nuts (4).
 3. Add, subtract, or transfer shims as required per the alignment correction chart (Figure 3).

NOTICE: Refer to "Notice" on page 3A-1 of this section.

4. Tighten the control arm pivot shaft nuts (4).
 - Always tighten control arm pivot shaft nut (4) on the thinner shim pack first. This improves control arm pivot shaft-to-frame clamping force.

Tighten

- Control arm pivot shaft nuts (4) to 95 N·m (70 lb. ft.).

A normal shim pack will leave at least two threads of the control arm pivot shaft bolt/screw exposed beyond the control arm pivot shaft nut. The

Figure 1 - Front Caster and Camber Adjustment

difference between front and rear shim packs should not exceed 10.16 mm (0.400 inch). If these requirements cannot be met in order to reach specifications, check for damaged suspension and/or steering components and replace parts as necessary.

TOE ADJUSTMENT

Figure 2

! Important

- Tie rod adjuster parts can become rusted in service. In such cases, it is recommended that if the torque required to remove the tie rod adjust clamp nut from the tie rod adjust clamp bolt/screw after breakaway exceeds 9 N.m (80 lb. in.), discard the tie rod adjust clamp nuts and tie rod adjust clamp bolts/screws. Apply penetrating oil between the tie rod adjust clamp and tie rod adjuster and rotate the tie rod adjust clamps until they move freely. Install new tie rod adjust clamp bolts/screws and tie rod adjust clamp nuts having the same part number to assure proper clamping at the specified torque.

Toe-in can be increased or decreased by changing the length of the tie rods. A threaded adjusting sleeve is provided for this purpose.

Figure 2 - Positioning Tie Rod Adjuster and Tie Rod Adjust Clamps

INSTRUCTIONS FOR USING ALIGNMENT CHART

1. Determine vehicle's current caster and camber measurements.
2. Using the caster reading, read down the appropriate column to the lines corresponding to the current camber reading.
3. Correction values will be given for the front upper control arm pivot shaft front and rear bolts/screws.
EXAMPLE: Current reading +2.25° left caster - 0.4° camber. By reading down the chart from +2.25° left - 0.4° camber you will find that the front upper control arm pivot shaft front bolt/screw requires an adjustment of -100 and the front upper control arm pivot shaft rear an adjustment of +001.

+ = Shim Addition
- = Shim Removal

Correction Value Example:

(as shown)
on current figure

Figure 3 - Alignment Correction Chart

Figure 4 - Thrust Angle

Adjust

NOTICE: Refer to "Notice" on page 3A-1 of this section.

1. Make sure steering wheel is set in a straight-ahead position within 2.5 degrees.
2. Toe adjustments are made separately at each individual tire and wheel.

3. Loosen the tie rod adjust clamp bolts/screws (11) at each end of the tie rod adjuster (7).
 - Rotate the inner and outer tie rod sockets to the limit of the control arm ball stud travel.
4. With the steering wheel set in straight-ahead position, turn the tie rod adjuster (7) to obtain the proper toe adjustment. Refer to "Specifications" at the end of this section.
5. Position tie rod adjust clamps (6) within the angles shown in Figure 2.
 - Slot in tie rod adjuster (7) must not be within the gap area of the tie rod adjust clamping jaws.
 - Tie rod adjust clamps must be between and clear of dimples before tightening tie rod adjust clamp nut.

Tighten

- Tie rod adjust clamp bolts/screws (11) to 19 N.m (14 lb. ft.). Tie rod adjust clamp ends may touch when tie rod adjust clamp nuts are tightened to specification but a gap must be visible adjacent to the tie rod adjuster (7).
6. When adjustment has been completed, check to see that the number of threads showing on each end of the tie rod adjuster (7) are equal and that the outer tie rod ends are at right angles to the steering knuckle.

Figure 5 - Caster, Camber and Toe

3A-6 WHEEL ALIGNMENT

MEASURING REAR ALIGNMENT ANGLES

After front tire and wheel alignment has been completed, the rear alignment angles should be checked if there is excessive rear tire wear or wheels do not track properly. Rear wheels should be parallel to and the same distance from the vehicle's centerline.

If tires do not track correctly after a front tire and wheel alignment, no amount of adjustment will correct the problem. Poor tracking or excessive rear

tire wear after a front tire and wheel alignment usually indicates that the axle housing, frame, or suspension arms have been bent.

REAR THRUST ANGLE ADJUSTMENT

If the thrust angle is not within specification, inspect the rear axle upper and lower control arms for damage. If the control arms are ok, then check the frame dimensions. Refer to SECTION 10-3.

POWER STEERING GEAR AND PUMP
ON-VEHICLE SERVICE

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: Do not start the vehicle with any power steering gear inlet or outlet hoses disconnected. When disconnected, cap or plug all openings of components. Failure to do so could result in contamination or loss of power steering fluid and damage to the system.

GENERAL DESCRIPTION

POWER STEERING GEAR

Figure 1

The steering gear is mounted on the left frame side rail and is secured by three bolts/screws. The steering gear is joined to the intermediate shaft by a coupling that helps isolate noise and road shock from the interior (Figure 1). The major internal components of the steering gear are the valve, worm gear, rack, and the pitman shaft. The movement of these parts, while turning or parked, is aided by hydraulic pressure supplied by the pump. Manual steering is always available at times when the engine is not running or in the event of pump or belt failure. Steering effort is increased under such conditions.

The stub shaft, valve, worm gear and rack are all “in line.” The steering gear has a recirculating ball system which acts as a rolling thread between the worm gear and the rack. The worm gear is supported by a worm gear thrust bearing preload and two conical worm gear thrust bearing races at the lower end, and stub shaft bearing in the stub shaft adjuster at the upper end. When the worm gear is turned right, the rack moves up in gear. Turning the worm gear left moves the rack down in gear. The rack teeth mesh with the sector, which is part of the pitman shaft. Turning the worm gear turns the pitman shaft, which turns the wheels through the linkage. The control valve in the steering gear directs the fluid to either side of the rack. The rack converts the hydraulic pressure into a mechanical force. If the power steering system becomes damaged and loses hydraulic pressure, the vehicle can be controlled manually. Refer to SECTION 3B1A for more information.

Figure 1 - Power Steering System

POWER STEERING PUMP

A constant displacement vane type pump provides hydraulic pressure for the power steering system. The pump is located on the engine and is belt driven by the engine vibration dampener.

The major components of the pump are the shaft, housing, ring, pressure plate, thrust plate, flow control valve, rotor, and vane. The reservoir cap has a fluid level indicator attached to show the fluid level in the fluid reservoir. There are two bore openings at the rear of the housing. The larger opening contains the ring, pressure plate, thrust plate, rotor, vane and end plate. The smaller opening contains the flow control valve seal (O-ring), valve and spring. The flow control orifice is used to calibrate the amount of fluid flow for specific applications. The pressure relief valve inside the flow control valve limits the pressure.

SEAL REPLACEMENT

Steering Gear Pitman Shaft Seal

Pitman shaft seals, which seal the pitman shaft of the gear, require special treatment. When leakage occurs in this area, always replace the pitman shaft seals, after inspecting and thoroughly cleaning the sealing surfaces. Replace the pitman shaft if pitting is found. If corrosion in the pitman shaft seal contact zone is slight, clean the surface of the pitman shaft with crocus cloth. Replace the pitman shaft only if leakage cannot be stopped by smoothing with crocus cloth first.

O-Ring Seals

Whenever a part which forms a sealing surface for an O-ring seal is removed, the O-ring seal should also be removed and replaced with a new O-ring seal. Lubricate all new O-ring seals with fluid to ease assembly.

ON-VEHICLE SERVICE

CHECKING AND ADDING POWER STEERING FLUID

Figure 2

Fluid level is indicated by marks on a fluid level indicator on the fluid reservoir cap (12).

Figure 2 - Checking Power Steering Fluid Level

NOTICE: When adding fluid or making a complete fluid change, always use the proper fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks. Refer to "Power Steering Fluid Recommendations" in this section.

If the fluid is warmed up, about 77° C (170° F) -hot to the touch, the fluid level should be between the "H" mark and the "C" mark. If the fluid is cool, about 21° C (70° F), the fluid level should be between the "C" mark and the line just below the "C" mark.

POWER STEERING FLUID REPLACEMENT

The fluid replacement procedure is a two-stage process: first, flushing the old fluid from the system with new fluid; and second, bleeding the system to remove trapped air. The following two sequences outline the steps in each procedure.

FLUSHING THE POWER STEERING SYSTEM

NOTICE: When adding fluid or making a complete fluid change, always use the proper fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks. Refer to "Power Steering Fluid Recommendations" in this section.

1. Raise and suitably support front of vehicle off ground until wheels are free to turn. Refer to SECTION 0A.
2. Siphon fluid from reservoir, disconnect power steering gear outlet hose from the reservoir and plug the reservoir.
 - Position power steering gear outlet hose toward large container to catch draining fluid.
3. While an assistant is filling fluid reservoir with either standard fluid or optional cold climate fluid, start and run engine at idle.

NOTICE: Do not hold the steering wheel against stops while flushing the system. Holding steering wheel against stops will cause high power steering system pressure, overheating, and damage to the power steering pump and/or power steering gear.

4. Turn steering wheel from stop to stop.
5. Continue draining until all of old fluid is cleared from power steering system. Addition of approximately 0.94 liters (1 quart) of new fluid will be required to flush system.

Inspect

- Draining fluid while refilling fluid reservoir.

Important

- Do not reuse any drained fluid.

3B-4 POWER STEERING GEAR AND PUMP ON-VEHICLE SERVICE

6. Remove plug from the reservoir and connect power steering gear outlet hose.
7. Turn engine off and fill fluid reservoir to "C" mark. Continue with following procedure "Bleeding the Power Steering System."

BLEEDING AIR FROM POWER STEERING SYSTEM

Figure 3

Refer to Figure 3 for recommended steering system bleed procedure.

NOTICE: When adding fluid or making a complete fluid change, always use the proper fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks. Refer to "Power Steering Fluid Recommendations" in this section.

NOTICE: If the system has been serviced, an accurate fluid level reading cannot be obtained unless air is bled from the system. The air in the fluid may cause pump cavitation noise and may cause pump damage over a period of time.

POWER STEERING DRIVE BELT

The pump is driven by a drive belt. No adjustment of the drive belt is required. To remove or install the drive belt, refer to "Serpentine Drive Belt and Tensioner" in SECTION 6A4A.

POWER STEERING PUMP PULLEY

Figure 4

Tools Required:

- J 25034-B Power Steering Pump Pulley Remover
- J 25033-B Power Steering Pump Pulley Installer

Remove or Disconnect

1. Fan blade and clutch, if equipped with mechanical fan. Refer to SECTION 6B.
2. Radiator outlet hose, if equipped with mechanical fan. Refer to SECTION 6B.
3. Serpentine drive belt from power steering pump pulley. Refer to SECTION 6A4A.
4. Pulley (2) from pump using J 25034-B.

Install or Connect

1. Pulley (2) to pump using J 25033-B.
 - Face of pulley hub must be flush with end of pulley shaft.
2. Serpentine drive belt to power steering pump pulley. Refer to SECTION 6A4A.
3. Radiator outlet hose, if removed. Refer to SECTION 6B.
4. Fan blade and clutch, if removed. Refer to SECTION 6B.

IDLE SPEED CONTROL POWER STEERING PRESSURE SWITCH

Figure 1

Remove or Disconnect

1. Electrical connection from pressure switch (4).
2. Place drain pan under gear (5).
3. Pressure switch (4) from inlet hose (3).

Install or Connect

NOTICE: Refer to "Notice" on page 3B-1 of this section.

1. Use power steering fluid to lightly coat threads of pressure switch (4) past O-ring seal.
2. Pressure switch (4) to inlet hose (3).

Tighten

- Pressure switch (4) to 13 N.m (115 lb. in.).
3. Electrical connection to pressure switch (4).
 4. Fill Power Steering Fluid Reservoir.
 5. Bleed power steering system. Refer to "Bleeding the Power Steering System" in this section.

HYDRAULIC PUMP FLOW CONTROL VALVE

Figure 5

Remove or Disconnect

1. Power steering pump. Refer to "Power Steering Pump" in this section.
2. Fitting (8) and O-Ring seal (9), on vehicles without variable effort steering.
3. Solenoid actuator and discharge fitting on vehicles with variable effort steering. Refer to SECTION 3B5.
4. Flow control valve (10) and spring (11) from pump (1), using magnet.

NOTICE: Do not disassemble the flow control valve.

Inspect

- Flow control valve (10) for free movement within housing bore.
 - A. If sticking occurs, check for burrs and clean as necessary.
 - B. If necessary, replace flow control valve (10).

Bleeding Air from Power Steering Systems

Before bleeding: Inspect steering system. Check, and correct as needed:

Hoses must not touch any other part of vehicle.

- Steering system noise could be caused by hose touching frame, body, or engine

All hose connections must be tight.

- Loose connections might not leak but could allow air into system

When to bleed:

After any component replacement
After disconnecting fluid line
In case of steering system noise

Why bleed?

To prevent pump damage
To ensure proper system operation
To stop steering system noise

Power Steering Fluid

Use only clean, new power steering fluid. Fluid must be

Conventional Climate

GM #1052884 - 16 ounce

#1050017 - 32 ounce

Cold Climate

GM #12345866 - 16 ounce

#12345867 - 32 ounce

How to bleed:

Switch ignition off.

Raise front wheels off ground.

Turn steering wheel full left.

Fill fluid reservoir to "FULL COLD" level. Leave cap off.

With assistant checking fluid level and condition, turn steering wheel lock-to-lock at least 20 times. Engine remains off.

- On systems with long return lines or fluid coolers, turn steering wheel lock-to-lock at least 40 times
- Trapped air may cause fluid to overflow. Thoroughly clean any spilled fluid to allow for leak check
- Keep fluid level at "FULL COLD"

While turning wheel, check fluid constantly.

- No bubbles are allowed
- For any sign of bubbles, recheck connections. Repeat step 5.

Start engine. With engine idling, maintain fluid level. Reinstall cap.

Return wheels to center. Lower front wheels to ground.

Keep engine running for two minutes.

Turn steering wheel in both directions.

Verify

- ☒ Smooth power assist
- ☒ Noiseless operation
- ☒ Proper fluid level
- ☒ No system leaks
- ☒ Proper fluid condition
- No bubbles, no foam, no discoloration

11 If all proper conditions apply, procedure is complete.

12 If any problem remains, see "Special Conditions"

Special Conditions:

Fluid

- Foam or bubbles in fluid
Fluid must be completely free of bubbles. In step 5, be alert to periodic bubbles that could indicate a loose connection or leak. O-ring seal in either the return hose or pressure hose.
- Discolored fluid (milky, opaque, or light tan color)

Switch ignition off. Wait two minutes. Recheck hose connections. Repeat steps 7-10. If condition still exists, replace and check a possible cause.

- ☒ Return hose clamps
- ☒ Return hose O-ring
- ☒ Pressure hose O-rings
- ☒ Gear cylinder line O-rings

Fill system and repeat bleed procedure for each possible cause. Repeat steps 7-10 to verify whether noise has been eliminated.

Noise

- Pump whine or groan
With engine running, recheck hoses for possible contact with frame body or engine. If no contact is found, follow either method below to cool down fluid and repressurize system.

Method 1: Normal Cool Down

Switch engine off.
Wait for system to cool.
Install reservoir cap.

Method 2: Partial Fluid Replacement

Switch engine off.
Use a suction device to remove fluid from reservoir.
Refill with cool, clean fluid.
Install reservoir cap.

After either method of cooling, start engine and allow engine to come up to operating temperature. If noise persists, remove and replace power steering pump. Repeat bleed procedure following pump replacement.

4-14-94
USOC33B

Figure 3 - Bleeding Air from Power Steering System

3B-6 POWER STEERING GEAR AND PUMP ON-VEHICLE SERVICE

Figure 4 - Removing and Installing Power Steering Pump Pulley

Install or Connect

NOTICE: Refer to “Notice” on page 3B-1 of this section.

1. Flow control valve spring (11) and flow control valve (10) to pump (1).
2. New O-ring seal (9) to fitting (8) on vehicles without variable effort steering
 - Lubricate O-Ring seal (9) with power steering fluid.
3. Fitting (8) and O-Ring seal (9), if equipped, to pump (1)

Tighten

- Fitting (8) to 75 N·m (55 lb. ft.).
4. Solenoid actuator and discharge fitting on vehicles equipped with variable effort steering. Refer to SECTION 3B5.

5. Power steering pump. Refer to “Power Steering Pump” in this section.
6. Fill fluid reservoir with fluid.
7. Bleed system. Refer to “Bleeding Air from Power Steering System” in this section.

POWER STEERING GEAR INLET AND OUTLET HOSES

Figures 5, 6, 7 and 8

Remove or Disconnect

1. Power steering fluid.
 - Siphon power steering fluid from reservoir (89) to prevent excessive spillage.
2. Power steering gear outlet hose (6) from reservoir (89).
 - A. Squeeze clamp (8) and slide downward.
 - B. Rotate and slide hose (6) from reservoir (89).
3. Power steering gear inlet hose (3) from power steering pump (1).
4. Secondary air injection reaction pump. Refer to SECTION 6E3.
5. Raise and suitably support vehicle. Refer to SECTION 0A.
6. Electrical connector from switch (4).
7. Power steering gear inlet and outlet hoses (3 and 6) from gear (5).
 - Slide steering gear shield rearward, away from outlet hose (6) to provide access to inlet and outlet hose (3 and 6) fittings.
8. Hose clamp bolts/screws (9).
9. Power steering gear inlet and outlet hose (3 and 6) with hose clamps (13) attached, from vehicle.
10. Hose clamps (13) from power steering gear inlet and outlet hoses (3 and 6).

Install or Connect

NOTICE: Refer to “Notice” on page 3B-1 of this section.

Important

- Always replace O-ring seals whenever hoses (3 and 6) are disconnected from gear (5) or pump (1).
1. Hose clamps (13) to power steering gear inlet and outlet hoses (3 and 6).
 2. Power steering gear inlet and outlet hoses (3 and 6) with hose clamps (13) attached, to vehicle.
 3. Hose clamp bolts/screws (9).

Tighten

- Bolts/screws (9) to 5 N·m (44 lb. in.).
4. Power steering gear inlet and outlet hoses (3 and 6) to gear (5) with new O-ring seals on the fittings.

Figure 5 - Hydraulic Pump Flow Control Valve

Tighten

- Power steering gear inlet and outlet hose fittings to 28 N·m (21 lb. ft.).
- Slide steering gear shield forward, onto outlet hose (6), after fittings are tightened.

5. Electrical connector to switch (4).

Tighten

- Idle speed control power steering pressure switch fitting to 13 N·m (115 lb. in.).

6. Lower vehicle.

7. Secondary air injection reaction pump. Refer to SECTION 6E3.

8. Power steering gear inlet hose (3) to power steering pump (1).

- Make sure power steering gear inlet hose insulator is just resting on air conditioning compressor as fitting is tightened.

Tighten

- Power steering gear inlet hose fitting to 28 N·m (21 lb. ft.).

9. Power steering gear outlet hose (6) to reservoir (89).

- A. Rotate and slide hose (6) onto reservoir (89).
- B. Squeeze clamp (8) and slide upward into position.

10. Fill reservoir (89) with power steering fluid.

11. Bleed power steering system. Refer to "Bleeding Air from Power Steering System" in this section.

Figure 6 - Power Steering Gear Connections

3B-8 POWER STEERING GEAR AND PUMP ON-VEHICLE SERVICE

POWER STEERING FLUID RESERVOIR

Figure 8

Remove or Disconnect

1. Power steering fluid.
 - A. Place drain pan under reservoir (89).
 - B. Siphon fluid from reservoir (89) to prevent excessive spillage.
2. Clamps (83 and 95).
3. Both hose ends from reservoir ports.
4. Rock and pull reservoir (89) from air conditioner accumulator bracket tang.

Install or Connect

1. Reservoir (89).
 - A. Place reservoir (89) to air conditioning accumulator bracket tang.
 - B. Push down on reservoir (89) to fully engage tangs.
2. Both hose ends to reservoir ports.
3. Clamps (83 and 95).
4. Remove drain pan.
5. Fill fluid reservoir (89) with fluid.
6. Bleed system. Refer to "Bleeding Air from Power Steering System" in this section.

POWER STEERING FLUID COOLER REPLACEMENT

POLICE VEHICLES ONLY

Remove or Disconnect

1. Power steering fluid.
 - A. Place a drain pan under reservoir (89) and gear (5).
 - B. Siphon fluid from reservoir (89) to prevent excessive spillage.
2. End of fluid cooler (87) from hose (6).
3. Fluid cooler fitting from gear (5).
4. Raise and suitably support vehicle. Refer to SECTION 0A.
5. Bolts/screws (84).
6. Clips (88).
7. Fluid cooler (87).
8. Nuts (97), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 3B-1 of this section.

Figure 8 - Power Steering Fluid Reservoir

3B-10 POWER STEERING GEAR AND PUMP ON-VEHICLE SERVICE

Install or Connect

1. Nuts (97), if removed.
2. Fluid cooler (87).
3. Clips (88).
4. Bolts/screws (84).

Tighten

- Bolts/screws (84) to 10 N.m (89 lb. in.).
5. Lower vehicle.
 6. Fluid cooler fitting to gear (5).

Tighten

- Fluid cooler fitting to 28 N.m (21 lb. ft.).
7. End of fluid cooler (87) to hose (6).
 8. Fill power steering fluid reservoir (89).
 9. Bleed system. refer to "Bleeding the Power Steering System" in this section.

POWER STEERING PUMP

Figures 7 and 10

Remove or Disconnect

1. Power steering fluid.
 - Siphon power steering fluid from reservoir (89) to prevent excessive spillage.
2. Drain engine cooling system. Refer to SECTION 6B.

3. Engine cooling fan pulley bracket, if vehicle is equipped with mechanical fan. Refer to SECTION 6B.
4. Heater inlet and outlet hoses from water pump.
5. Heater inlet and outlet hose clip bolt/screw from generator and power steering pump bracket (94).
 - Position heater inlet and outlet hoses up and out of the way to prevent coolant spillage.
6. Drive belt from power steering pump pulley. Refer to SECTION 6A4A.
7. Power steering gear inlet hose (3) from power steering pump (1).
8. Power steering fluid reservoir hose (90) from power steering pump (1).
 - A. Squeeze clamp (7) and slide away from power steering pump (1).
 - B. Rotate and slide hose (90) away from power steering pump (1).
9. Pump bracket bolts/screws (24) and generator bracket bolt/screw (25).
10. Power steering pump (1) with pump pulley (2).
11. Pump pulley from power steering pump. Refer to "Power Steering Pump Pulley" in this section.
12. Power steering pump bolts/screws (96) and bracket (93), if necessary.

Important

- To service power steering solenoid actuator, discharge, fitting and flow control valve, refer to SECTION 3B5.

Figure 9 - Power Steering Fluid Cooler (Police Vehicles Only)

Install or Connect

NOTICE: Refer to "Notice" on page 3B-1 of this section.

1. Power steering pump bracket (93) and bolts/screws (96), if removed.

Tighten

- Power steering pump bolts/screws (96) to 50 N.m (37 lb. ft.).
2. Pump pulley to power steering pump. Refer to "Power Steering Pump Pulley" in this section.
 3. Power steering pump (1) with pump pulley (2).
 4. Generator bracket bolt/screw (25) and pump bracket bolts/screws (24).

Tighten

- Pump bracket bolts/screws (24) to 41 N.m (30 lb. ft.).
 - Generator bracket bolt/screw (25) to 50 N.m (37 lb. ft.).
5. Power steering fluid reservoir hose (90) to power steering pump (1).
 - A. Rotate and slide hose (90) onto power steering pump (1).
 - B. Squeeze clamp (7) and slide toward power steering pump (1).

6. Power steering gear inlet hose (3) to power steering pump (1) with new O-ring seal on fitting.

Tighten

- Power steering gear inlet hose fitting to 28 N.m (21 lb. ft.).
7. Drive belt to power steering pump pulley. Refer to SECTION 6A4A.
 8. Heater inlet and outlet hose clip bolt/screw to generator and power steering pump bracket (94).

Tighten

- Heater inlet and outlet hose clip bolt/screw to 1.9 N.m (17 lb. in.).
9. Heater inlet and outlet hoses to water pump.
 10. Engine cooling fan pulley bracket, if vehicle is equipped with mechanical fan. Refer to SECTION 6B.

Important

- Do not start engine until after power steering system has been bled.
11. Refill power steering fluid reservoir (89).
 12. Refill engine cooling system. Refer to SECTION 6B.
 13. Bleed power steering system. Refer to "Bleeding Air from Power Steering System" in this section.
 14. Bleed engine cooling system. Refer to SECTION 6B.

Figure 10 - Power Steering Pump

POWER STEERING GEAR

Figure 11

Remove or Disconnect

1. Power steering fluid.
 - A. Place drain pan under gear (5).
 - B. Siphon fluid from reservoir to prevent excessive spillage.
2. Intermediate shaft from power steering gear. Refer to SECTION 3F.
3. Brake modulator valve bracket nut from gear (5).
4. Raise and suitably support vehicle. Refer to SECTION 0A.
5. Pitman arm from power steering gear. Refer to SECTION 3B3.
6. Inlet and outlet hoses from gear (5).
 - Raise hoses to prevent fluid drainage.
7. Bolts/screws (30), washers (29) and gear (5).

Install or Connect

NOTICE: Refer to "Notice" on page 3B-1 of this section.

1. Position gear (5) to frame.
2. Washers (29) and bolts/screws (30) loosely.

Adjust

- Gear (5) so that it aligns as straight as possible with intermediate shaft.

Tighten

- Bolts/screws (30) to 85 N.m (63 lb. ft.).
3. Inlet and outlet hoses to gear (5).

Tighten

- Hose fittings to 28 N.m (21 lb. ft.).

Figure 11 - Mounting Power Steering Gear

4. Pitman arm to power steering gear. Refer to SECTION 3B3.
5. Lower vehicle.
6. Brake modulator valve bracket nut to gear (5).

Tighten

- Valve bracket nut to 24 N.m (18 lb. ft.).
7. Intermediate shaft to power steering gear (5). Refer to SECTION 3F.
 8. Remove drain pan.
 9. Fill power steering fluid reservoir.
 10. Bleed system. Refer to "Bleeding Air from Power Steering System" in this section.

STEERING GEAR PITMAN SHAFT SEALS**Figures 12 and 13**

Tools Required:

J 4245 Internal Snap Ring Pliers

J 6219 Pitman Shaft Oil Seal Installer

**Remove or Disconnect**

1. Pitman arm from power steering gear. Refer to SECTION 3B3.

**Clean**

- Exposed end of shaft (53) and housing (54).
2. Retainer ring (35) using J 4245.
 3. Place drain pan under shaft (53).
 4. Washer (34) and seal (33).
 5. Start engine and turn wheels fully to left to force out pitman shaft seals and pitman shaft washers.
 6. Turn engine off.
 7. Washer (32) and seal (31).

**Inspect**

- Pitman shaft seal surfaces for roughness or pitting. If pitted, replace power steering gear.
- Housing (54) for burrs. Remove burrs before installing new pitman shaft seals.

**Install or Connect**

1. Seal (31) and washer (32).
2. Coat seal (33) and washer (34) with grease.
3. Seal (33) using J 6219.
4. Washer (34).
5. Retainer ring (35) using J 4245.
6. Pitman arm to power steering gear. Refer to SECTION 3B3.
7. Remove drain pan.
8. Fill power steering fluid reservoir.
9. Bleed system. Refer to "Bleeding Air from Power Steering System" in this section.

SPECIAL TOOLS

SECTION 3B1A

POWER STEERING GEAR UNIT REPAIR

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Figure 2 Power Steering Gear – Legend

STEERING GEAR ADJUSTMENTS

Important

- Before any adjustments are made on the steering gear, refer to “Steering, Suspension, Tires and Wheels Diagnosis” (Section 3) for reviewing the possible steering system problems. Any steering gear adjustment is made only as a correction and not as a periodic adjustment.

For proper adjustment, remove the steering gear from the vehicle. Drain the power steering fluid from the gear. Mount the gear in a vise and make the following adjustments.

The steering gear requires two adjustments:

- The worm thrust bearing preload
- The pitman shaft over-center preload adjustment

The worm thrust bearing preload is controlled by the amount of compression force exerted by the adjuster plug on the conical worm bearing thrust races.

The pitman shaft over-center preload is controlled by the pitman shaft adjuster screw, which determines the clearance between the rack piston and the pitman shaft sector teeth.

Important

- Adjust the worm thrust bearing preload first, then adjust the pitman shaft over-center preload.

WORM THRUST BEARING PRELOAD ADJUSTMENT

Figures 1 thru 6

Tool Required:

J 7624 Spanner Wrench

1. Remove steering gear from vehicle. Refer to “Power Steering Gear Replacement” in section 3B.
2. Rotate stub shaft (40) back and forth to drain power steering fluid.
3. Remove adjuster plug lock nut (48) from housing (20).

Notice: See “Notice” on page 3B1A-1 of this section.

Figure 3 Loosening Adjuster Plug Nut

3B1A-4 POWER STEERING GEAR UNIT REPAIR

- Turn adjuster plug (55) in (clockwise) using J 7624 until adjuster plug (55) and thrust bearing (58) are firmly bottomed in housing (20).

Tighten

- Adjuster plug (55) to 30 N•m (22 lb. ft.).
- Place an index mark on housing (20) even with one of the holes in the adjuster plug (55).
 - Measure back counterclockwise 13 mm (1/2 inch) and place a second mark on housing (20), (see Figure 5).
 - Turn adjuster plug (55) counterclockwise until hole in adjuster plug (55) is aligned with the second mark on the housing (20) (see Figure 6).
 - Install adjuster plug lock nut (48).

Tighten

- Adjuster plug lock nut (48) to 109 N•m (80 lb. ft.) using a drift in a notch.
 - Hold adjuster plug (55) to maintain alignment of the marks.
- Install steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

PITMAN SHAFT OVER-CENTER PRELOAD ADJUSTMENT

Figures 7 thru 9

- Remove steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.
- Rotate stub shaft back and forth to drain power steering fluid.
- Loosen the adjuster lock nut (8).
- Turn the pitman shaft adjuster screw counterclockwise until fully extended, then turn clockwise 1 full turn.
- Rotate the stub shaft (40) from stop to stop, using a 12-point socket, and count the number of turns.

Figure 4 Marking Housing Even with Adjuster Plug

- Starting at either stop, turn the stub shaft (40) back 1/2 the total number of turns. This is the "center" of the gear.

- When the gear is centered, the flat on the stub shaft (40) should face upward and be parallel with the side cover (7) and the master spline on the pitman shaft should be in line with the adjuster screw (see Figure 8).

- Place a torque wrench on the stub shaft (40) with the handle in the vertical position. Rotate the stub shaft (40) 45 degrees each side of the center (see Figure 9).

- Stub shaft must rotate smoothly and must not stick or bind.
- Record the worm bearing preload measured on or near the center.
- Recorded bearing preload to be 0.7-1.7 N•m (6-15 lb. in.), with worm and ballnut installed. If the torque is outside this range, the gear assembly should be readjusted or repaired as required.

Notice: See "Notice" on page 3B1A-1 of this section.

Adjust

- Over-center torque by turning the pitman shaft adjuster screw clockwise until the correct preload torque is obtained.
- Add 0.7-1.1 N•m (6-10 lb. in.) torque to the previously measured worm bearing preload torque.

Tighten

- Adjuster lock nut (8) to 49 N•m (36 lb. ft.).
 - Prevent adjuster screw from turning while tightening adjuster lock nut (8).
- Install steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

Figure 5 Remarking the Housing

STEERING GEAR SERVICE

PITMAN SHAFT AND SIDE COVER REPLACEMENT

Figures 1 and 2

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.
- Pitman arm from steering gear. Refer to "Steering Linkage" in section 3B3.
- Rotate stub shaft back and forth to drain power steering fluid.

Clean

- Exposed end of pitman shaft and housing.
- Use a wire brush to clean pitman shaft spline.

Disassemble

1. Adjuster lock nut (8).
2. Bolts (10).
 - Rotate stub shaft (40), using a 12-point socket, to center gear.
3. Side cover (7), gasket (11), and pitman shaft (12) as an assembly.
4. Pitman shaft (12) from the side cover (7).

Assemble

Notice: See "Notice" on page 3B1A-1 of this section.

1. Pitman shaft (12) to side cover (7) by screwing pitman shaft (12) in until it fully seats to side cover (7).
2. Adjuster lock nut (8).
 - Do not tighten adjuster lock nut (8) until after pitman shaft adjustment has been made.

Figure 6 Aligning the Adjuster Plug to the Second Mark

Figure 8 Aligning Pitman Shaft Master Spline

Figure 7 Aligning the Stub Shaft

Figure 9 Checking Over-Center Rotational Torque

3B1A-6 POWER STEERING GEAR UNIT REPAIR

3. Gasket (11) to side cover (7) and bend tabs around edges of side cover (7).
4. Pitman shaft assembly and side cover (7) to housing (20).
5. Bolts (10).

Tighten

- Bolts (10) to 60 N•m (44 lb. ft.).

Adjust

- Pitman shaft. Refer to "Pitman Shaft Over-Center Sector Adjustment" in this section.

Install or Connect

- Steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

HOUSING END PLUG REPLACEMENT

Figure 10

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.

Disassemble

- Rotate stub shaft back and forth to drain fluid.
1. Retaining ring (1) by using a punch inserted into the housing access hole to unseat it.
 2. Plug (2).
 3. O-ring seal (3).

Figure 10 Housing End Plug

Assemble

- Lubricate O-ring seal with power steering fluid.
1. O-ring seal (3) into housing (20).
 2. Plug (2).
 3. Retaining Ring (1).
 - Install retaining ring (1) so that open end is approximately 25 mm (1 inch) from access hole in housing (20).

Install or Connect

- Steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

Figure 11 Removing Adjuster Plug

Figure 12 Removing Bearing Retainer

ADJUSTER PLUG ASSEMBLY REPLACEMENT

Figures 1, 2, 11 thru 14

Tools Required:

J 7624 Spanner Wrench

J 6221 Adjuster Plug Bearing Remover and Installer

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.

Disassemble

- Adjuster plug lock nut (48) from housing (20).
- Adjuster plug (55) from housing (20) using J 7624.
- Thrust washer bearing retainer (62) from adjuster plug (55) by using a screwdriver to pry at raised area of bearing retainer (62).
- Bearing spacer (61), races (57 and 60) and thrust bearing (58).
- O-ring seal (56).
- Retaining ring (50).
 - Position adjuster plug (55) face down on a suitable support (see Figure 13).
- Needle bearing (53), dust seal (51) and lip seal (52) using J 6221 to drive them from adjuster plug (55).

Assemble

- Position adjuster plug (55) face up on a suitable support.

Notice: Needle bearing must be installed with identification on bearing facing tool to prevent damage to bearing.

- Needle bearing (53) to adjuster plug (55) using J 6221.

- Lip seal (52) to adjuster plug (55) using J 6221.
- Dust seal (51) to adjuster plug (55) using J 6221.
- Retaining ring (50).
- O-ring seal (56) to adjuster plug (55).
- Large bearing race (57), thrust bearing (58), small bearing race (60) and bearing spacer (61) to adjuster plug (55).
- Thrust washer bearing retainer (62) to adjuster plug (55).
 - Lubricate O-ring seal (56) and rubber lip of seals (51 and 52).

Notice: When installing adjuster plug, care should be taken not to cut the seals.

- Adjuster plug (55) to housing (20) using J 7624.

Adjust

- Thrust bearing preload. Refer to "Worm Bearing Preload Adjustment" in this section.
- Install adjuster plug lock nut (48), and using a drift in a notch, tighten securely.
 - Hold adjuster plug (55) to maintain alignment of the marks.

Adjust

- Pitman shaft over-center sector. Refer to "Pitman Shaft Over-Center Sector Adjustment" in this section.

Install or Connect

- Power steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

Figure 13 Removing Bearing and Seals

Figure 14 Installing Bearing and Seals

VALVE REPLACEMENT

Figures 1, 2, 15 thru 18

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.

Disassemble

- Adjuster plug (55). Refer to "Adjuster Plug Assembly Replacement" in this section.
- Stub shaft (40) and valve assembly.
- Stub shaft (40) from valve assembly, if necessary.
 - Tap stub shaft (40) lightly on a wood block to loosen shaft cap.
 - Pull cap and valve spool (41) out from valve body (43) 6 mm (1/4 inch) and disengage stub shaft pin from hole in valve spool (41).
- Valve assembly, if necessary.
 - Remove valve spool (41) by pulling and rotating from valve body (43).
 - Remove valve spool O-ring seal (42).
 - Remove valve body teflon rings (46) and O-ring seals (45).

Assemble

- Valve assembly, if necessary.
 - Install valve spool O-ring seal (42) to valve spool (41).
 - Lubricate valve spool (41) and O-ring seal (42) with power steering fluid.

- Install valve spool (41) to valve body (43) by pushing and rotating until hole in valve spool (41) for stub shaft pin is accessible from opposite end of valve body (43).
- Stub shaft (40) to valve spool, if necessary and insert pin.
 - Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.
 - Install O-ring seals (45) and teflon rings (46) to valve body (43).
 - Lubricate O-ring seals (45) and teflon rings (46) with power steering fluid.
 - Stub shaft (40) and valve assembly to worm shaft (13), fitting pin on worm shaft (13) to slot in the valve assembly.
 - Adjuster plug. Refer to "Adjuster Plug Assembly Replacement" in this section.

Figure 15 Bearing, Worm and Valve Assembly

Figure 16 Remove and Install Stub Shaft

Figure 17 Remove and Install Spool

Adjust

- Thrust bearing preload and pitman shaft over-center sector. Refer to "Steering Gear Adjustments" in this section.

Install or Connect

- Steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

RACK PISTON AND WORM SHAFT REPLACEMENT

Figures 1, 2, 19, 20, 21 and 22

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.

Figure 18 Engage Stub Shaft

Figure 19 Rack Piston

Disassemble

Tool Required:

J 21552 Rack Piston Arbor

1. Pitman shaft and side cover. Refer to "Pitman Shaft and Side Cover Replacement" in this section.
2. Housing end plug. Refer to "Housing End Plug Replacement" in this section.
 - Turn stub shaft counterclockwise until the rack piston (26) begins to come out of the housing (20).
3. Rack piston plug (27).
 - Insert J 21552 into bore of rack piston (26). Hold J 21552 tightly against worm shaft while turning the stub shaft counterclockwise.
 - The rack piston (26) will be forced onto J 21552 and hold the rack piston balls (25) in place.
4. Rack piston (26), rack piston balls (25), and J 21552 together from housing (20).
5. Valve. Refer to "Valve Replacement" in this section.
6. Worm shaft (13).
7. Thrust bearing (16) and races (15 and 17).
8. J 21552 from rack piston (26).
9. Rack piston balls (25).
10. Screws (21), clamp (22) and ball guide (23).
11. Teflon ring (5).
12. O-ring seal (6).

Clean

- All disassembled parts.

Inspect

- All disassembled parts for wear. Replace if necessary.

Assemble

Tools Required:

J 8947 Rack Piston Teflon Ring Compressor

J 21332 Rack Piston Arbor

1. O-ring seal (6) and teflon ring (5) and lubricate with power steering fluid.
2. Worm shaft (13) to rack piston (26) outside of housing (20).
 - Fully seat worm shaft (13) to rack piston (26) and align worm shaft spiral groove with rack piston ball return guide hole (see Figure 20).

Important

- Make sure that all rack piston balls (25) are reinstalled in the rack piston. Improper rack piston ball installation may result in personal injury.

3B1A-10 POWER STEERING GEAR UNIT REPAIR

Notice: The black rack piston balls are smaller than the silver balls. The black and silver balls must be installed alternately into the rack piston and ball guide to maintain rack piston to worm shaft preload.

- Lubricate rack piston balls (25) with power steering fluid.
- 3. Rack piston balls (25) to rack piston (26) by inserting through ball return guide hole while turning worm shaft (13) counterclockwise.
- 4. Remaining rack piston balls (25) to ball guide (23) using grease at each end to retain balls (25) (see Figure 21).
- 5. Ball guide (23) to rack piston (26).

Notice: See "Notice" on page 3B1A-1 of this section.

- 6. Ball guide clamp (22) and screws (21).

Tighten

- Screws (21) to 58 N•m (43 lb. in.).
 - Insert J 21552 into bore of rack piston (26) while turning worm shaft (13) counterclockwise. The rack piston (26) will be forced onto J 21552 and will hold the rack piston balls (25) in place.
- 7. Races (15 and 17) and thrust bearing (16) to worm shaft (13) (see Figure 22).
 - 8. Worm shaft (13) to housing (20).
 - 9. Valve. Refer to "Valve Replacement" in this section.
 - 10. Rack piston (26) to worm shaft (13) from J 21552, using J 8947 to compress seals.
 - Hold J 21552 tightly against worm shaft and turn stub shaft clockwise until rack piston (26) is seated on worm shaft (13).

Figure 20 Installing the Balls in the Rack Piston

Important

- Make sure that all rack piston balls (25) are reinstalled in the rack piston. Improper rack piston ball installation may result in personal injury.

- 11. Rack piston plug (27).

Tighten

- Rack piston plug (27) to 150 N•m (111 lb. ft.)
- 12. Housing end plug. Refer to "Housing End Plug Replacement" in this section.
- 13. Pitman shaft and side cover. Refer to "Pitman Shaft and Side Cover Replacement" in this section.

Adjust

- Steering gear. Refer to "Steering Gear Adjustments" in section 3B.

Install or Connect

- Steering gear. Refer to "Power Steering Gear Replacement" in this section.

PITMAN SHAFT SEALS AND BEARING REPLACEMENT

Figures 1 and 2

This procedure covers the seal and bearing replacement for steering gears. Seals may be replaced without removing the power steering gear. Refer to "On Vehicle Service."

Tools Required:

- J 6278 Pitman Shaft Bearing Remover and Installer
- J 6219 Pitman Shaft Oil Seal Installer
- J 4245 Internal Snap Ring Pliers

Figure 21 Placing Balls in the Ball Return Guide

Remove or Disconnect

- Pitman arm from steering gear. Refer to "Steering Linkage" in Section 3B3.

Clean

- Exposed end of pitman shaft (12) and housing (20).
- Use a wire brush to clean pitman shaft splines.

Disassemble

Notice: Use care not to score the housing bore when prying out seals and washers

1. Pitman shaft dust seal (64) using a screwdriver to pry it from the housing (20).
2. Retaining ring (35) using J 4245.
3. Backup washer (31) and pitman shaft seal (63) using a screwdriver.

Inspect

- Housing (20) for burrs and remove if necessary.
4. Needle bearing (28).
 - Insert J 6278 through the hole in the top of the housing (20) and drive out bearing (28).

Assemble

- Coat lips of pitman shaft seal (63) and dust seal (64) with white petroleum grease.
1. Needle bearing (28) to housing (20) using J 6278.
 2. Pitman shaft seal (63) (cavity facing in) using J 6219.

Notice: Seal (63) must not bottom against needle bearing (28).

3. Backup washer (31).
4. Retaining ring (35) using J 4245.
5. Pitman shaft dust seal (64) (cavity facing out) using J 6219.
 - Cover entire cavity of dust seal (64) with white petroleum grease.

Notice: Clean pitman shaft splines after packing seal cavity with grease.

Notice: Pack the small cavity between pitman shaft seal (63) and dust seal (64) with white petroleum grease before reinstalling pitman shaft (12). Packing this area will help prevent early seal leaks by eliminating moisture accumulation, and rust on the pitman shaft.

6. Pitman shaft and side cover. Refer to "Pitman Shaft and Side Cover Replacement" in this section.

Install or Connect

- Pitman arm to steering gear. Refer to "Steering Linkage" in Section 3B3.

CHECK VALVE REPLACEMENT

Remove or Disconnect

- Steering gear from vehicle. Refer to "Power Steering Gear Replacement" in section 3B.

Disassemble

Notice: Use care not to damage threads of housing when removing check valve.

- Check valve (18) by prying from housing with a small screwdriver.

Assemble

- Check valve (18) using a 3/8-inch diameter piece of tubing 100 mm (4 inches) long to drive into housing.

Install or Connect

- Steering gear. Refer to "Power Steering Gear Replacement" in section 3B.

SECTION 3B1B

POWER STEERING PUMP UNIT REPAIR

CAUTION: Before removing or installing any electrical unit or when a tool or equipment could easily come in contact with “live” exposed electrical terminals, disconnect the negative battery cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the “off” or “lock” position.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

VARIABLE ASSIST STEERING ACTUATOR REPLACEMENT*(Buick only)**Figures 1, 2 and 3***Remove or Disconnect**

1. Negative (-) battery cable.
2. Pump assembly from vehicle, if necessary for access.
3. Power steering pressure line.
4. Electrical connector from Variable Assist Steering actuator (28).
5. Retaining clip (27) from Variable Assist Steering actuator (28).
6. Variable Assist Steering actuator (28) and discharge fitting (33).
 - Discharge fitting from Variable Assist Steering actuator.
 - O-ring seals (30, 31 and 32) from Variable Assist Steering actuator (28).

**Install or Connect**

1. O-ring seals on Variable Assist Steering actuator.
2. Discharge fitting (33) to Variable Assist Steering actuator (28).
3. Variable Assist Steering actuator and discharge fitting (33) to pump assembly.
4. Position discharge fitting (33).

**Tighten**

- Variable Assist Steering actuator (28) to 62 N•m (46 lb. ft.).

5. Electrical connector to Variable Assist Steering actuator (28).
6. Retaining clip (27) to Variable Assist Steering actuator (28).
 - If a new actuator (28) is being installed, position electrical connector before installing retaining clip (27).
7. Power steering pressure line.
8. Pump assembly to vehicle, if removed.
9. Negative (-) battery cable.

Figure 3 Variable Assist Steering Actuator Assembly

3B1B-4 POWER STEERING PUMP UNIT REPAIR

DRIVE SHAFT SEAL REPLACEMENT

Figures 1, 2 and 4

Remove or Disconnect

- Power steering pump from vehicle. Refer to "Power Steering Pump Replacement" in section 3B.

Disassemble

- Protect drive shaft (18) with shim stock.
- Seal (17) by cutting with a chisel.

Assemble

Tool Required:

J 22670 Shaft Oil Seal Installer

- Lubricate seal (17) with power steering fluid.
- Seal (17) using J 22670.

Install or Connect

- Power steering pump. Refer to "Power Steering Pump Replacement" in section 3B.

Disassemble

- Retaining ring (12).
- End plate (11) and spring (10).

Notice: Examine exposed portion of pump drive shaft. If it is corroded, clean with crocus cloth before removing. This will prevent damage to the shaft bushing which might require replacement of the entire housing.

- Pressure plate (8) by using a rubber mallet to tap lightly on the drive shaft (18).
- Pump ring (7).
- Pump vanes (6).
- Shaft, rotor and thrust plate assembly.
- Shaft retaining ring (5).
- Pump rotor (3).
- Thrust plate (2).
- Drive shaft (18).
- Dowel pins (1).
- O-ring seals (13 and 15).

Important

- Use new seals and drive shaft retaining ring when assembling pump.

END PLATE AND ROTATING GROUP REPLACEMENT

Figures 1, 2 and 5

Remove or Disconnect

- Power steering pump from vehicle. Refer to "Power Steering Pump Replacement" in section 3B.

Figure 4 Drive Shaft Seal

Figure 5 Rotating Group

Assemble

- Lubricate O-ring seals (13 and 15) with power steering fluid.
- 1. O-ring seals (13 and 15) to housing (16).
- 2. Dowel pins (1) to housing (16).
- 3. Thrust plate (2) and pump rotor (3) to drive shaft (18) and secure with retaining ring (5).
- 4. Shaft, rotor and thrust plate assembly to housing (16).

- 5. Pump vanes (6) to pump rotor (3).
- 6. Pump ring (7) to housing (16) with identification arrows on top edge of ring (7) facing outward.
- 7. Pressure plate (8).
- 8. Spring (10) and end plate (11).
- 9. Retaining ring (12).

Install or Connect

- Power steering pump. Refer to "Power Steering Pump Replacement" in section 3B.

Steering Linkage Shock Absorber.....	3B3-5	Special Tools.....	3B3-9

GENERAL DESCRIPTION

A parallelogram type steering linkage connects both wheels to the steering gear through the pitman arm. The outer tie rods are attached to the steering knuckle and hub and the inner tie rods are attached to the relay rod. The left end of the relay rod is supported by the steering gear and the right end by the idler arm which pivots on an idler arm support attached to the frame. The pitman arm and idler arm are always parallel to each other and move through symmetrical arcs. Lubricate steering linkage with EP Chassis Lubricant GM P/N 1052356 or equivalent, meeting GM-6031M specifications whenever work is done on the steering linkage, and at intervals specified in the maintenance schedule. Refer to SECTION 0B. Worn or damaged steering linkage seals should be replaced.

NOTICE: Do not attempt to disconnect a steering linkage joint by driving a wedge between the joint and the attached part. Seal damage may result which will cause premature failure of the joint.

ON-VEHICLE SERVICE

CHECKING STEERING LINKAGE WEAR

Figure 1

Tool Required:
J 8001 Dial Indicator Set

Important

- The front wheel bearings must be adjusted prior to performing this inspection. Refer to SECTION 3C for adjustment procedure.

Inspect

- Steering linkage for wear.
 - A. Raise the vehicle on one side at the frame directly behind the front wheel so that the wheel is approximately 25 mm (1 inch) off the floor. Refer to SECTION 0A.
 - B. Position the steering wheel in the straight ahead and locked position.
 - C. Position J 8001 at outer edge of rim.
 - D. Grasp front wheel and move the wheel back and forth.
 - E. Read indicator. Indicator reading should not exceed 2.74 mm (0.108 inch).
 - If indicator reading is not within specifications, a check should be made of all front suspension and steering linkage parts.

3B3-2 STEERING LINKAGE

Figure 1 - Checking Steering Linkage Wear

STEERING LINKAGE TIE RODS

Figures 2, 3 and 4

! Important

- Tie rod adjuster parts often become rusted in service. In such cases, it is recommended that if the torque required to remove the tie rod clamp nut (9) from the bolt/screw (7) after breakaway exceeds 9 N.m (80 lb. in.), discard nuts (9) and bolts/screws (7). Apply penetrating oil between tie rod clamp (8) and adjuster (11) and rotate the clamps (8) until they move freely. Install new bolts/screws (7) and nuts (9) having the same part number to ensure proper clamping at specified torque.

Steering Linkage Inner Tie Rod

Tools Required:

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Nut (22).
3. Inner tie rod ball joint from relay rod (14) using J 24319-B.
4. Loosen tie rod clamp bolt/screw (7) at the inner end of the tie rod adjuster (11).

! Important

- Count the number of turns required to remove the inner tie rod (3) from the tie rod adjuster (11).
5. Inner tie rod (3) from tie rod adjuster (11).

🔍 Inspect

- Threads on the ball stud and in the inner tie rod nut (22). If threads are not clean and smooth, the ball may turn inside the inner tie rod when attempting to tighten the nut during installation.
- Ball stud taper for nicks.
- Inner tie rod seals (31) for damage. Replace as necessary. Refer to "Steering Linkage Inner Tie Rod Seal" under "Steering Linkage Tie Rod Seal Replacement" in this section.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Lubricate the tie rod adjuster threads with EP Chassis Lube GM P/N 1052356 or equivalent.
2. Threaded end of inner tie rod (3) into the tie rod adjuster (11) using the same number of turns counted during removal.
3. Inner tie rod ball joint into the relay rod (14).
4. J 29193 to seat the tapers.

🔧 Tighten

- J 29193 to 20 N.m (15 lb. ft.).
5. Remove J 29193.
 6. Nut (22) to the ball stud.

🔧 Tighten

- Nut (22) to 47 N.m (35 lb. ft.).

! Important

- Before tightening tie rod adjust clamp bolt/screw (7) on the rod adjuster (11), make certain that the adjuster (11) and adjust clamp (8) are positioned properly. Refer to "Steering Linkage Tie Rod Adjuster" in this section for proper positioning of the adjuster (11) and adjust clamp (8).

🔧 Tighten

- Tie rod clamp bolt/screw (7) to 19 N.m (14 lb. ft.).
7. Lower vehicle.

🔧 Adjust

- Toe to specification. Refer to SECTION 3A.

Figure 2 - Steering Linkage Components

3B3-4 STEERING LINKAGE

Figure 3 - Separating Steering Linkage Inner Tie Rod at Steering Linkage Relay Rod

Figure 4 - Separating Steering Linkage Outer Tie Rod at Steering Knuckle and Hub

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Cotter pin (19) and nut (20) from the outer tie rod (10).
3. Outer tie rod (10) from steering knuckle and hub (21) by using J 24319-B.
4. Loosen tie rod clamp bolt/screw (7) at the outer tie rod end of the tie rod adjuster (11).

Important

- Count the number of turns required to remove the outer tie rod end from the tie rod adjuster (11).
5. Outer tie rod (10) from the tie rod adjuster (11).

Inspect

- Threads on the ball stud and in the outer tie rod nut (20). If threads are not clean and smooth the ball may turn inside the outer tie rod when attempting to tighten the outer tie rod nut (20) during installation.
- Ball stud taper for nicks.
- Outer tie rod seals (2) for damage. Replace if necessary. Refer to "Steering Linkage Outer Tie Rod Seal" under "Steering Linkage Tie Rod Seal Replacement" in this section.

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Lubricate the tie rod adjuster threads with EP Chassis Lube GM P/N 1052356 or equivalent.
2. Threaded end of the outer tie rod (10) into the tie rod adjuster (11) using the same number of turns counted during removal.
3. Outer tie rod (10) into the steering knuckle and hub (21).
4. Nut (20).

Tighten

- A. Nut (20) to 47 N.m (35 lb. ft.).
 - B. After tightening nut (20) to specification, tighten again just enough to align slot in nut (20) with hole in stud. Do not back off nut (20) to insert cotter pin (19). Turn to next hole.
5. Cotter pin (19).

Important

- Before tightening the tie rod adjust clamp bolt/screw (7) on the tie rod adjuster (11), make certain that the adjuster (11) and adjust clamp (8) are positioned properly. Refer to "Steering Linkage Tie Rod Adjuster" in this section for proper positioning of the adjuster (11) and adjust clamp (8).

Tighten

- Tie rod clamp bolt/screw (7) to 19 N.m (14 lb. ft.).
6. Lower vehicle.

**Adjust**

- Toe to specification. Refer to SECTION 3A.

STEERING LINKAGE RELAY ROD**Figures 2, 3, 5, 6 and 7****Tools Required:**

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)

**Remove or Disconnect**

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Inner tie rods from relay rod. Refer to "Steering Linkage Tie Rods" in this section.
3. Nut (5) from relay rod (14) at pitman arm (13).
4. Relay rod (14) with seal (12) from the pitman arm (13) by using J 24319-B.
 - Move the steering linkage as required to free pitman arm (13) from the relay rod (14).
5. Shock absorber nut (35), if equipped.
6. Shock absorber (28), if equipped, from relay rod (14).
7. Nut (23) from idler arm (17).
8. Relay rod (14) with seal (15) from idler arm (17) by using J 24319-B.

**Inspect**

- Steering linkage seals for damage. Replace as necessary.

**Install or Connect**

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Relay rod (14) with seal (15) to idler arm (17).
2. J 29193 to seat the tapers.

**Tighten**

- A. J 29193 to 20 N.m (15 lb. ft.).
 - B. Remove J 29193.
3. Nut (23) to the ball stud.

**Tighten**

- Nut (23) to 47 N.m (35 lb. ft.).
4. Shock absorber (28), if removed, to relay rod (14).
 5. Nut (35).

**Tighten**

- Nut (35) to 72 N.m (53 lb. ft.).
6. Relay rod (14) with seal (12) to pitman arm (13).
 7. J 29193 to seat tapers.

Figure 5 - Steering Linkage Shock Absorber

**Tighten**

- A. J 29193 to 20 N.m (15 lb. ft.).
 - B. Remove J 29193.
8. Nut (5) to the ball stud.

**Tighten**

- Nut (5) to 47 N.m (35 lb. ft.).
9. Inner tie rods to relay rod. Refer to "Steering Linkage Tie Rods" in this section.
 10. Lower vehicle.

**Adjust**

- Toe to specification. Refer to SECTION 3A.

STEERING LINKAGE SHOCK ABSORBER**Figure 5****Remove or Disconnect**

1. Raise and suitably support vehicle.
2. Nut (35) and shock absorber (28) from relay rod (14).
3. Nut (29) and bolt/screw (30) from frame.
4. Shock absorber (28).

Figure 6 - Separating Pitman Arm from Steering Linkage Relay Rod

Figure 7 - Separating Steering Linkage Idler Arm from Relay Rod

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

- Shock absorber (28).
- Nut (29) and bolt/screw (30) to frame.
- Shock absorber (28) and nut (35) to relay rod (14).

Tighten

- Nut (29) to 54 N.m (40 lb. ft.).
- Nut (35) to 72 N.m (53 lb. ft.).
- Lower vehicle.

STEERING LINKAGE TIE ROD ADJUSTER

Figures 2, 3, 4 and 8

Tool Required:

J 24319-B Universal Steering Linkage Puller

Important

- Tie rod adjuster parts often become rusted in service. In such cases, it is recommended that if the torque required to remove the tie rod clamp nut (9) from the tie rod clamp bolt/screw (7) after breakaway exceeds 9 N.m (80 lb. in.), discard nuts (9) and bolts/screws (7). Apply penetrating oil between the tie rod clamp (8) and adjuster (11) and rotate the steering linkage clamps (8) until they move freely. Install new bolts/screws (7) and nuts (9) having the same part number to ensure proper clamp at specified torque.

Remove or Disconnect

- Raise and suitably support vehicle. Refer to SECTION 0A.
- Outer tie rod. Refer to "Steering Linkage Outer Tie Rod" under "Steering Linkage Tie Rods" in this section.
- Loosen tie rod clamp bolt/screw (7) at the inner tie rod end of the tie rod adjuster (11).

Important

- Count the number of turns required to remove the tie rod adjuster (11) from the inner tie rod (3).
- Tie rod adjuster (11) from the inner tie rod (3).

Inspect

- Outer tie rod seals (2) for damage. Replace as necessary.
- Threads on ball stud and outer tie rod nut (20). If threads are not clean and smooth the ball stud may turn in the outer tie rod when attempting to tighten nut (20).
- Ball stud taper for nicks.

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

- Lubricate tie rod threads with EP Chassis Lubricant GM P/N 1052356 or equivalent.

Figure 8 - Positioning Steering Linkage Tie Rod Adjuster and Adjust Clamps

2. Tie rod adjuster (11) to the inner tie rod (3) using the same number of turns as counted during removal.
3. Outer tie rod. Refer to "Steering Linkage Outer Tie Rod" under "Steering Linkage Tie Rods" in this section.

Important

- Ensure that both ends of the tie rod adjuster (11) are threaded an equal distance onto the inner and outer tie rods (3 and 10).

Adjust

- Tie rod adjust clamps (8).
 - A. Install the tie rod clamp bolts/screws (7) in the direction shown in Figure 8.
 - B. Rotate the inner and outer tie rod sockets rearward to the limit of the ball stud travel.
 - C. Position clamps (8) within the angles shown in Figure 8.
 - D. Slot in tie rod adjuster (11) must not be within the gap area of the clamping jaws.
 - E. Clamps (8) must be between and clear of the dimples before tightening nuts (9).

Tighten

- Nuts (9) to 19 N·m (14 lb. ft.).
4. Lower vehicle.

Adjust

- Toe to specification. Refer to SECTION 3A.

STEERING LINKAGE IDLER ARM

Figures 2, 7 and 9

Tools Required:

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)

Measure

- Vertical lash.
 - The idler arm should be replaced if vertical lash exceeds 3.2 mm (1/8 inch) when an up and down force of 110 newtons (25 pounds) is applied at the relay rod end of the idler arm.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (24) and nuts (25) connecting the idler arm support to the frame.
3. Nut (23) from ball stud connecting the idler arm (17) to the relay rod (14).
4. Idler arm (17) and seal (15) from relay rod (14) using J 24319-B.

Inspect

- Seal (15) for damage. Replace if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. The steering linkage assembly requires proper location of the idler arm (17) on its threaded support so that the idler arm ball socket will be level with the pitman arm ball socket. The idler arm support must be threaded into the idler arm bushing until the distance from the center of the lower mounting bolt hole is 59.44 mm +/- 1.60 mm (2.344 +/- 0.063 inches) from the top edge of the idler arm, refer to figure 9. The position of the idler arm must be adjusted before the idler arm (17) is installed in the vehicle. After adjusting, the idler arm support must be free to rotate 90 degrees in each direction.
2. Idler arm support to the frame with the attaching idler arm bolts/screws (24) and nuts (25).

Tighten

- Nuts (25) to 83 N·m (61 lb. ft.).
3. Relay rod (14) to idler arm (17) with seal (15).
 4. J 29193 to seat the tapers.

3B3-8 STEERING LINKAGE

Figure 9 - Steering Linkage Idler Arm Adjustment

Tighten

- J 29193 to 20 N.m (15 lb. ft.).

5. Remove J 29193.

6. Nut (23) to the ball stud.

Tighten

- Nut (23) to 47 N.m (35 lb. ft.).

7. Lower vehicle.

Adjust

- Toe to specification. Refer to SECTION 3A.

PITMAN ARM

Figures 2 and 6

Tools Required:

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)
- J 9172 Pitman Arm Puller

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Nut (5) from the pitman arm ball stud.
3. Relay rod (14) with seal (12) from pitman arm (13) using J 24319-B.
 - Move the steering linkage as required to free the pitman arm (13) from the relay rod (14).
4. Seal (12).

Inspect

- Seal (12) for damage. Replace if necessary.
5. Nut (27) and washer (26) from the pitman arm shaft.

NOTICE: Do not hammer on J 9172 as damage to the pitman arm may result.

6. Pitman arm (13) using J 9172.

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Make sure the front wheels are in the straight ahead position.
2. Pitman arm (13) on the pitman arm shaft.
3. New nut (27) and washer (26).

Tighten

- Nut (27) to 243 N.m (179 lb. ft.).

4. Seal (12) to relay rod (14).

5. Relay rod (14) to the pitman arm (13).

6. J 29193 to seat tapers.

Tighten

- J 29193 to 20 N.m (15 lb. ft.).

7. Remove J 29193.

8. Nut (5) to the ball stud.

Tighten

- Nut (5) to 47 N.m (35 lb. ft.).

9. Lower vehicle.

STEERING LINKAGE TIE ROD SEAL REPLACEMENT

Steering Linkage Outer Tie Rod Seal

Figure 2

Tools Required:

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Cotter pin (19) and nut (20) from the outer tie rod (10).
3. Outer tie rod (10) from the steering knuckle and hub (21) by using J 24319-B.
4. Pry the old seal (2) off the outer tie rod (10).

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Wipe the outer tie rod (10) clean.
2. Position a new seal (2) on the outer tie rod stud.
3. Firmly push the flange of the seal (2) over the seat of the housing.
4. Outer tie rod (10) to the steering knuckle and hub (21).

5. Nut (20).
 - A. Nut (20) to 47 N.m (35 lb. ft.).
 - B. Tighten nut (20) again just enough to align slot in outer tie rod (10) with hole in stud. Do not back off nut (20) to insert the cotter pin (19). Turn to the next hole.
6. Cotter pin (19).
7. Lower vehicle.

Steering Linkage Inner Tie Rod Seal

Figure 2

Tools Required:

- J 24319-B Universal Steering Linkage Puller
- J 29193 Steering Linkage Installer (12 mm)

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Nut (22) from the inner tie rod (3).
3. Inner tie rod (3) from the relay rod (14) using J 24319-B.
4. Pry the old seal (31) off inner tie rod (3).

Install or Connect

NOTICE: Refer to "Notice" on page 3B3-1 of this section.

1. Wipe the inner tie rod (3) clean.
2. Position a new seal (31) on the inner tie rod stud.
3. Firmly push the flange of the seal (31) over the seat on the housing.
4. Inner tie rod (3) to the relay rod (14).
5. Nut (22).
6. J 29193 to seat the tapers.

Tighten

- J 29193 to 20 N.m (15 lb. ft.).
7. Remove J 29193.
 8. Nut (22) to the ball stud.

Tighten

- Nut (22) to 47 N.m (35 lb. ft.).
9. Lower vehicle.

SECTION 3B5

VARIABLE EFFORT STEERING

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: Do not start the vehicle with the inlet hose or outlet hose disconnected. When disconnected, cap or plug all openings of components. Failure to do so could result in contamination or loss of fluid and damage to the power steering system.

GENERAL DESCRIPTION

VARIABLE EFFORT STEERING
COMPONENTS AND OPERATION

The variable effort power steering system, optional on Buick only, varies the power steering fluid flow rate from the pump with varying vehicle speeds. Maximum flow rate occurs at 1500 rpm pump speed (engine running a little faster than idle), and thereby minimizes steering effort. As the vehicle speed increases, the flow rate is decreased, thereby increasing the required steering effort which provides the driver with improved "road feel" and directional stability. The variable effort steering system is made up of the following components:

- Power Steering Control Module - Processes vehicle speed information and steering wheel rotation rate information from the steering wheel rotational sensor. It also provides the Pulse Width Modulated (PWM) signal to the power steering solenoid actuator located on the pump.
- Power Steering Solenoid Actuator - upon receiving a signal from the control module, the power steering solenoid actuator moves a pintle into the orifice in the pump to regulate the amount of fluid flow generated from the pump.

- Steering Wheel Rotational Sensor - Sends steering wheel speed information to the power steering control module, allowing full power steering assist during a quick maneuver (fast steering wheel movement).
- Inlet Hose - The inlet hose leads to a check valve on the steering gear. This valve reduces the amount of steering wheel kick when driving over irregular road surfaces, such as railroad tracks and chuck holes, while operating at speeds with reduced flow rate and pressure.

DIAGNOSIS

A variable effort steering electrical system malfunction will cause the power steering system to revert to full-time power assist. If the vehicle is experiencing this condition, refer to SECTION 8A-45. A mechanical/hydraulic steering system malfunction will cause the loss of power steering at all times and/or objectionable noises.

3B5-2 VARIABLE EFFORT STEERING

MECHANICAL/HYDRAULIC DIAGNOSIS

Figure 1

Tools Required:

- J 5176-D Power Steering Pressure Tester 0-2000 PSI and
- J 5176-92 Power Steering Pressure Tester Adapter and
- J 38391-2A Hose, or
- J 25323-A Power Steering System Analyzer and
- J 29525-92 Power Steering Analyzer 18 mm Adapter

If a hydraulic or mechanical malfunction of the pump or steering gear is suspected, perform the following procedure to determine the cause:

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Disconnect inlet hose at steering gear.
 - Place drain pan under steering gear to catch any power steering fluid which may leak.
3. Disconnect power steering solenoid actuator electrical connector.
4. Disconnect idle speed control switch electrical connector.
5. Lower vehicle.
6. Connect J 5176-D, J 5176-92, and J 38391-2A, or J 25323-A and J 29525-92 to steering gear and inlet hose.
 - The power steering system may be tested using J 5176-D or J 25323-A. Testing with J 25323-A will measure flow rate as well as pressure.
7. Open pressure tester valve on J 5176-D or J 25323-A.

CAUTION: After connecting J 5176-D or J 25323-A, ensure that hoses do not contact serpentine belt or pulleys. Personal injury may result.

8. Bleed power steering system. Refer to SECTION 3B.

9. Start engine and allow engine to reach normal operating temperature.

10. With engine at idle and pressure tester valve open on J 5176-D or J 25323-A, pressure should be no more than 1 034 kPa (150 psi).

- If the pressure is more than 1 034 kPa (150 psi), check the inlet and outlet hoses for restrictions and the check valve on the steering gear for proper assembly.

NOTICE: Do not leave the pressure tester valve fully closed for more than 5 seconds as the pump could be damaged.

11. Fully close the pressure tester valve on J 5176-D or J 25323-A three times and record the pressure reading each time. Each reading should be at least 6 895 kPa (1,000 psi). The three readings should be within 345 kPa (50 psi) of each other.

- If the pressure readings are high enough and are within 345 kPa (50 psi) of each other, the pump is functioning properly.

- If the pressure readings are high enough, but are not within 345 kPa (50 psi) of each other, the hydraulic pump flow control valve in the pump is sticking.

- Remove the control valve, clean it and remove any burrs using crocus cloth or fine hone.

- If the power steering system contains some contamination, flush it. Refer to SECTION 3B.

- If the pressure readings are less than 6 895 kPa (1,000 psi), replace the valve and recheck.

- If pressures are still low, replace the rotor and vanes.

- If the pump checks to specification, leave the control valve open and turn the steering wheel (or have someone else turn it) to both stops.

Figure 1 - Power Steering Pressure Tester

- Record the highest pressures and compare with the highest pump pressure recorded earlier.
 - If the pressure at both stops is not the same as maximum pressure, the steering gear is leaking internally and must be repaired. Refer to SECTION 3B1A.

- Turn off the engine.
- Remove J 5176-D, J 5176-92 and J 38391-2A, or J 25323-A and J 29525-92.
- Connect idle speed control switch electrical connector.
- Raise and suitably support vehicle. Refer to SECTION 0A.
- Connect power steering solenoid actuator electrical connector.
- Connect inlet hose to steering gear, and tighten fitting at pump if loosened.

Tighten

- Inlet hose fittings to 28 N.m (21 lb. ft.).
- Lower Vehicle
 - Bleed the power steering system. Refer to SECTION 3B.

ON-VEHICLE SERVICE

CHECKING AND ADDING FLUID

Power steering fluid level is indicated by marks on an indicator on the reservoir cap.

NOTICE: When adding power steering fluid or making a complete fluid change, always use power steering fluid specified in SECTION 0B. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

If the fluid is warmed up, about 77° C (170° F)-hot to the touch, the fluid level should be at the "H" mark. If the fluid is cool, about 21° C (70° F), the fluid level should be at the "C" mark.

POWER STEERING SOLENOID ACTUATOR, DISCHARGE FITTING, AND FLOW CONTROL VALVE

Figures 2 and 3

Remove or Disconnect

- Power steering pump. Refer to SECTION 3B.
- Match mark power steering pump (1) and discharge fitting (12).
- Retaining clip (17), solenoid actuator (16), and discharge fitting (12) from pump (1).
 - Note the position of the actuator electrical terminal for proper placement during installation.
- Discharge fitting (12) from solenoid actuator (16).
- O-Ring seals (13, 14, and 15) from solenoid actuator (16).
- Flow control valve (10) and spring (11), if necessary, using a magnet.

Figure 2 - Power Steering Pump Flow Control Valve and Pump Actuator

3B5-4 VARIABLE EFFORT STEERING

Install or Connect

NOTICE: Refer to "Notice" on page 3B5-1 of this section.

1. Spring (11) and flow control valve (10), if removed.
2. Lubricate O-ring seals (13, 14, and 15) with power steering fluid, GM P/N 1050017 or equivalent, meeting GM specification number 9985010.
3. O-ring seals (13, 14, and 15) to solenoid actuator (16).
4. Discharge fitting (12) to solenoid actuator (16).
5. Solenoid actuator (16) and discharge fitting (12) to pump (1).
 - Align match marks on discharge fitting (12) and power steering pump (1).
 - If either pump (1) or fitting (12) were replaced, refer to Figure 3 for correct fitting orientation.

Tighten

- Solenoid actuator (16) to 62 N.m (46 lb. ft.).
6. Retaining clip (17) to correctly positioned solenoid actuator (16).
 - Position solenoid actuator electrical connector so that connector is facing directly to the right of the vehicle (away from the engine) when pump (1) is in installed position.
 7. Power steering pump. Refer to SECTION 3B.

Figure 3 - Variable Effort Steering Discharge Fitting Orientation

Install or Connect

NOTICE: Refer to "Notice" on page 3B5-1 in this section.

1. Two bolts/screws (22) attaching power steering control module (20) to bracket (21).

Tighten

- Bolts/screws (22) to 1.9 N.m (17 lb. in.).
2. Power steering control module connector to power steering control module (20).
 3. Speed alert, seat belt, ignition key, lamps and turn signal alarm to convenience center.

POWER STEERING CONTROL MODULE

Figure 4

Remove or Disconnect

1. Speed alert, seat belt, ignition key, lamps and turn signal alarm at convenience center.
2. Power steering control module connector from power steering control module (20).
3. Two bolts/screws (22) attaching power steering control module (20) to bracket (21).

FRONT SUSPENSION

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The front suspension is designed to allow each wheel to compensate for changes in the road surface level without appreciably affecting the opposite wheel (Figures 1 and 2). Each wheel is independently connected to the frame by a steering knuckle, control arm ball studs, and control arms. The control arms are specifically designed and positioned to allow the steering knuckles to move in a prescribed three-dimensional arc. The front wheels are held in proper relationship to each other by two tie rods which are connected to steering arms on the steering knuckles and to the relay rod.

Front springs are mounted between the spring housings on the frame and the lower control arms. Ride control is provided by double, direct acting shock absorbers mounted inside the front springs and attached to the lower control arms. The upper portion of each shock absorber extends through the front spring housing and is secured with two insulators, two insulator retainers and a nut.

Side roll of the front suspension is controlled by a spring steel stabilizer shaft. It is mounted to the frame with insulators which prevent road noise from being transmitted to the frame. The ends of the stabilizer shaft are connected to the lower control arms

with links. Stabilizer shaft link insulators at these connections provide flexibility and ride features. The upper control arm is attached to an upper control arm pivot shaft through upper control arm bushings. The upper control arm pivot shaft, in turn, is bolted to frame brackets. An upper control arm ball stud is riveted to the outer end of the upper control arm. It is pre-loaded by a rubber spring to insure proper seating of the ball in the socket. The upper control arm ball stud is attached to the steering knuckle by a taper-lock feature and a nut retained with a cotter pin.

The inner ends of the lower control arm have pressed-in bushings. Control arm bolts/screws, passing through the bushings, attach the lower control arm to the frame. The lower control arm ball stud is a press fit in the lower control arm and attaches to the steering knuckle using a taper-lock feature and a nut that is retained with a cotter pin.

Rubber grease seals are used at control arm ball studs to keep dirt and moisture from entering and damaging the ball stud bearing surfaces.

ON-VEHICLE SERVICE

CONTROL ARM BALL STUD CHECKING

Before checking control arm ball studs, the front wheel bearings must first be properly adjusted. Refer to "Front Wheel Bearing Adjustment" in this section.

Inspect

- Boots for cuts or tears. Whenever cuts or tears are found, the control arm ball stud **MUST** be replaced.

Lower Control Arm Ball Stud

Figure 3

The lower control arm ball stud has a visual wear indicator. Checking the condition of the lower control arm ball stud is a simple procedure but must be followed accurately to prevent unnecessary replacement.

Inspect

- Vehicle must be supported by the wheels so that weight of vehicle will properly load the ball studs.
- The ball stud is inspected for wear by visual observation alone. Wear is indicated by the position of the 12.7 mm (0.50 inch) diameter nipple into which the front suspension lubricant fitting is threaded. This round nipple projects

1.27 mm (0.050 inch) beyond the surface of the ball stud cover when new. Normal wear will result in the surface of this nipple retreating very slowly inward.

- Wipe the front suspension lubricant fitting and nipple free of dirt and grease. Observe or scrape a screwdriver or fingernail across the cover. If the round nipple is flush or inside the cover surface, replace the ball stud (Figure 3).

Upper Control Arm Ball Stud

Figure 4

Inspect

- Raise the vehicle and position floor stands under the left and right lower control arm as near as possible to each ball stud. Refer to SECTION 0A.

Important

- Vehicle must be stable and should not rock on the floor stands.
 - Upper control arm bumper must not contact frame.
- Position dial indicator against the wheel rim (Figure 4).
 - Grasp wheel, and push in on bottom of tire while pulling out at the top (Figure 4). Read gage, then reverse the push-pull procedure. Horizontal deflection on dial indicator should not exceed 3.18 mm (0.125 inch).

FRONT LOWER CONTROL ARM BALL STUD WEAR INDICATOR

Figure 3 - Front Lower Control Arm Ball Stud Wear Indicator

Figure 4 - Checking Front Upper Control Arm Ball Stud

- If the dial indicator reading exceeds 3.18 mm (0.125 inch), replace the ball stud.
- 4. Anytime the ball stud is disconnected from the steering knuckle, check for looseness or if the ball stud can be twisted in its socket with your fingers. If either of these conditions exists, replace the ball stud.
- 5. Lower vehicle.

CONTROL ARM BALL STUD REPLACEMENT

Lower Control Arm Ball Stud

Figures 5 through 8

↔ Remove or Disconnect

Tools Required:

- J 23742 Ball Joint Separator
- J 9519-30 Ball Joint Fixture
- J 9519-16 Ball Joint Installer
- J 21474-13 Control Arm Bushing Installer

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Place floor jack under lower control arm spring seat.

! Important

- Floor jack must remain under lower control arm spring seat during removal and installation to retain front spring and lower control arm in position.
- 4. To disconnect the ball stud from the steering knuckle, remove the cotter pin and ball stud nut. J 23742 can be used to separate the ball stud from the steering knuckle (Figure 5).

Figure 5 - Disconnecting Front Lower Control Arm Ball Stud

Figure 6 - Guiding Front Lower Control Arm Past Front Brake Shield

5. Guide lower control arm out of opening in brake shield with a putty knife or similar tool (Figure 6).
6. Block steering knuckle out of the way by placing a wooden block between frame and upper control arm.

Inspect

- The tapered hole in the steering knuckle. If out-of-roundness, deformation or damage is noted, the steering knuckle must be replaced.
7. Lower control arm ball stud lubricant fittings.
 8. Install J 9519-16, J 9519-30 and J 21474-13 (Figure 7).
 9. Ball stud from lower control arm.

Figure 7 - Removing Front Lower Control Arm Ball Stud

Figure 8 - Installing Front Lower Control Arm Ball Stud

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Tools Required:
 J 9519-9 Ball Joint Installer
 J 9519-30 Ball Joint Fixture

3C-6 FRONT SUSPENSION

1. Position ball stud into lower control arm and press ball stud in until it bottoms on the lower control arm, using J 9519-9 and J 9519-30 as illustrated in Figure 8.

Important

- Grease purge (hole) in seal must be facing inboard.
2. Place ball stud in steering knuckle.

Tighten

- Lower steering knuckle and hub nut to 112 N.m (83 lb. ft.). Then tighten enough to align slot in lower steering knuckle and hub nut with hole in ball stud.
3. Steering knuckle and hub cotter pin.
 4. Front suspension lubricant fitting and lubricate until grease appears at the seal.
 5. Tire and wheel. Refer to SECTION 3E.

Adjust

- Wheel alignment. Refer to SECTION 3A.
6. Lower vehicle.

Upper Control Arm Ball Stud

Figures 9 through 13

Remove or Disconnect

Tools Required:
J 23742 Ball Joint Separator

1. Raise front of vehicle and support lower control arm with floor stands. Refer to SECTION 0A.

Important

- Floor jack or stand must remain under lower control arm during removal and installation to retain front spring and lower control arm in position.
 - The weight of the vehicle is used to relieve spring tension on the upper control arm. Floor stands must be positioned between the spring seats and lower control arm ball studs of the front lower control arms.
2. Tire and wheel. Refer to SECTION 3E.
 3. Loosen the upper control arm ball stud from the steering knuckle:
 - A. Remove cotter pin (18) and nut (17).
 - B. Install J 23742 (Figure 9).
 - C. Apply pressure on upper control arm ball stud by expanding the tool until the ball stud breaks loose.
 - D. Remove J 23742, then pull upper control arm ball stud free from steering knuckle. Support the steering knuckle to prevent weight of the steering knuckle from damaging the front brake hose or wheel speed sensor wire.

Figure 9 - Disconnecting Front Upper Control Arm Ball Stud

Figure 10 - Drilling Front Upper Control Arm Ball Stud Rivet

Figure 11 - Drilling Front Upper Control Arm Ball Stud Rivet Heads

4. With upper control arm in the raised position, drill out four rivets approximately 6 mm (1/4 inch) deep, using a 1/8-inch drill bit (Figure 10).
5. Drill off rivet heads, using a 1/2-inch drill bit (Figure 11).

Figure 12 - Removing Front Upper Control Arm Ball Stud

6. Punch out rivets, using a small punch, and remove ball stud (Figure 12).

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. Position new upper control arm (3) and install the four service kit bolts (64) and service kit nuts (63) (Figure 13). Use specifications in ball joint kit.
2. Remove the temporary support from steering knuckle, then connect ball stud (2) to steering knuckle (16).

Tighten

- Nut (17) to 83 N·m (61 lb. ft.), then tighten to align the slot in the nut (17) with the hole in the ball stud (2).
3. Cotter pin (18).
 4. Remove jackstands from lower control arms.
 5. Front suspension lubricant fitting and lubricate until grease appears at the seal.
 6. Tire and wheel. Refer to SECTION 3E.
 7. Lower vehicle.

Adjust

- Wheel alignment. Refer to SECTION 3A.

Figure 13 - Front Upper Control Arm Ball Stud Attachment

FRONT WHEEL BEARINGS AND SEALS

Figures 14 through 17

Remove or Disconnect

Tool Required:

J 29117-A Wheel Bearing Cup Remover

1. Front brake rotor. Refer to "Front Brake Rotor" in this section.
2. The outer bearing (28) from front brake rotor (27). The inner bearing (25) will remain in the front brake rotor (27) and may be removed after prying out the hub seal (24). Discard hub seal (24).
3. Drive out old inner and outer races (56 and 57) from front brake rotor (27) with a drift or J 29117-A inserted behind inner and outer races (56 and 57) (Figure 15).

3C-8 FRONT SUSPENSION

Figure 14 - Steering Knuckle and Front Brake Rotor

Figure 15 - Removing Front Wheel Inner and Outer Bearings

Clean

- All grease from the front brake rotor (27) and spindle, and thoroughly clean out any grease in the inner and outer bearings (25 and 28). Use clean solvent. Use a small brush with no loose bristles to clean out all old grease.

NOTICE: Do not spin the inner or outer bearing assemblies with compressed air while drying or the bearings may be damaged.

Inspect

- Inner and outer bearings for cracked cage and worn or pitted rollers.
- Inner and outer races for cracks, scores or a brinelled condition. Refer to SECTION 3.

Figure 16 - Installing Front Wheel Inner Bearing Outer Race

- Steering knuckle spindle for excess wear or rough bearing seating area. Replace steering knuckle if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Tool Required:
 J 33067 Wheel Bearing Packer

Figure 17 - Installing Front Wheel Outer Bearing Outer Race

1. If the inner and outer races (56 and 57) were removed, drive or press the inner and outer races (56 and 57) into the front brake rotor (27) (Figures 16 and 17).
2. Use an approved high temperature wheel bearing grease. Do not mix greases, mixing may change the grease properties and result in poor performance.
3. Apply a thin film of grease to the spindle at the outer bearing seat and at the inner bearing seat, shoulder, and seal seat.
4. Put a small quantity of grease inboard of each inner and outer bearing cup in the hub. This can be applied with your finger, forming a dam to provide extra grease availability to the inner and outer bearings (25 and 28) and to keep thinned grease from flowing out of the inner and outer bearings (25 and 28).

NOTICE: If hand packing is used, it is extremely important to work the grease thoroughly into the inner and outer bearings between the rollers, cone, and the cage. Failure to do this could result in premature bearing failure.

5. Fill the inner and outer bearing cone and rollers full of grease, using J 33067. If a tool is not available, the inner and outer bearings (25 and 28) can be packed by hand.
6. Place the inner bearing cone and roller in the front brake rotor (27). Then using your finger, put an additional quantity of grease outboard of the inner bearing (25).
7. Install a new hub seal (24) using a flat plate until the hub seal (24) is flush with the front brake rotor (27). Lubricate the lip of the hub seal (24) with a thin layer of grease.

8. Carefully install the front brake rotor, front wheel bearing washer and front wheel bearing nut.

Tighten

- Initially torque the front wheel bearing nut to 16 N.m (12 lb. ft.) while turning the front brake rotor forward by hand.
9. Put an additional quantity of grease outboard of the outer bearing (28). This provides extra grease availability to the outer bearing.
 10. Front brake rotor. refer to "Front Brake Rotor" in this section.

Adjust

- Front wheel bearings. Refer to "Front Wheel Bearing Adjustment" in this section.

SPRINGS

Figures 18 through 21

Remove or Disconnect

Tool Required:

J 6627-A Tie Rod Puller

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Wheel speed sensor and secure. Refer to SECTION 5E1.
4. Shock absorber. Refer to "Shock Absorbers" in this section.
5. Stabilizer shaft linkage from lower control arm. Refer to "Stabilizer Shaft and Insulators" in this section.
6. Steering linkage outer tie rod cotter pin.
7. Steering linkage outer tie rod nut.
8. Steering knuckle from steering linkage outer tie rod end, using J 6627-A (Figure 18).
9. Install universal spring compressor (Figure 19).
 - Compress spring (10).

Figure 18 - Separating Steering Linkage Outer Tie Rod End (Typical)

3C-10 FRONT SUSPENSION

Figure 19 - Removing Front Spring

10. Support lower control arm (39).
11. Nuts (21) and bolts/screws (41).
12. Pivot lower control arm (39) rearward.
13. Universal spring compressor.
14. Spring (10).

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. Properly position spring (10) on the lower control arm (39) making sure the spring insulator is in place. Take care that the spring (10) is properly installed (Figure 20).

NOTICE: Handling must not cause any damage to the corrosion protection coating on the springs. Any removal of coating must be repaired.

2. Universal spring compressor (Figure 19).
 - Compress spring (10).
3. Pivot lower control arm (39) forward into position.
4. Position lower control arm (39) into frame and install bolts/screws (41) and nuts (21) (Figure 21).
 - Do not tighten bolts/screws (41) or nuts (21) at this time.
5. Remove universal spring compressor.
6. Steering knuckle to steering linkage outer tie rod end.
7. Steering linkage outer tie rod nut.

Tighten

- Steering linkage outer tie rod nut to 47 N.m (35 lb. ft.).
- Additional tightening may be required to install cotter pin.

Figure 20 - Front Spring Positioning

Figure 21 - Installing Front Lower Control Arm Bolt/Screw

8. Steering linkage outer tie rod cotter pin.
9. Remove support from lower control arm (39).
10. Stabilizer shaft linkage to lower control arm. Refer to "Stabilizer Shaft and Insulators" in this section.
11. Shock absorber. Refer to "Shock Absorbers" in this section.
12. Wheel speed sensor in steering knuckle. Refer to SECTION 5E1.
13. Tire and wheel. Refer to SECTION 3E.
14. Lower vehicle.
 - Vehicle must be supported by the wheels before tightening the lower control arm bolts/screws (41) or nuts (21).

Tighten

- Nuts (21) to 145 N.m (107 lb. ft.) or, Bolts/screws (41) to 155 N.m (114 lb. ft.).

STEERING KNUCKLE

Figures 18, 22 and 23

Remove or Disconnect

Tools Required:

- J 6627-A Tie Rod Puller
- J 23742 Ball Joint Separator

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Wheel speed sensor from the steering knuckle and secure. Refer to SECTION 5E1.
4. Front brake caliper. Refer to SECTION 5B1.
5. Front brake rotor.
6. Three brake shield bolts/screws (58) from steering knuckle (16) (Figure 22).
7. Separate steering linkage outer tie rod end from steering knuckle (16), using J 6627-A (Figure 18).
8. Hub seal, if steering knuckle (16) is to be replaced (Figure 23).

Figure 22 - Front Brake Shield Attachment

Figure 23 - Front Wheel Hub Seal

9. Position a floor jack under lower control arm near spring seat and raise jack until it supports lower control arm.

Important

- Floor jack must remain under lower control arm spring seat during removal and installation of steering knuckle to retain spring and lower control arm in position.
10. Separate ball studs from steering knuckle (16) using J 23742. Refer to "Control Arm Ball Stud Replacement" in this section.
 11. Raise upper control arm to disengage ball stud from steering knuckle (16).
 12. Raise steering knuckle (16) from ball stud and remove steering knuckle (16).

Inspect

- The tapered holes in the steering knuckle (16). Remove any dirt. If out-of-roundness, deformation, or damage is noted, the steering knuckle (16) must be replaced.
- Ball studs.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

3C-12 FRONT SUSPENSION

1. Upper and lower ball studs into steering knuckle. Refer to "Control Arm Ball Stud Replacement" in this section.
2. Front wheel hub seal and front brake shield.
3. Three brake shield bolts/screws (58).
4. Steering linkage outer tie rod end into steering knuckle (16).
5. Front brake rotor.
6. Front brake caliper. Refer to SECTION 5B1.
7. Wheel speed sensor to steering knuckle. Refer to SECTION 5E1.
8. Tire and wheel. Refer to SECTION 3E.
9. Remove jackstands and floor jack.
10. Lower vehicle.

Adjust

- Front wheel alignment. Refer to SECTION 3A.

FRONT BRAKE ROTOR

Figure 14

NOTICE: Whenever a front brake rotor is removed, check the ABS wheel speed sensor and sensor ring for dirt or debris. A dirty sensor may cause intermittent ABS wheel speed sensor fault. Wipe using a clean cloth. Do not use chemicals on the sensor, or the sensor may be damaged.

Remove or Disconnect

(Tire and Wheel Removed)

1. Wheel speed sensor from steering knuckle and secure. Refer to SECTION 5E1.
2. Front brake caliper. Refer to SECTION 5B1.
3. Wheel bearing lubricant cap (30).
4. Cotter pin (55), nut (31) and washer (29) from steering knuckle (16).
5. Carefully pull front brake rotor (27) from steering knuckle spindle.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Important

- When installing new front brake rotors, do not refinish the surfaces of these parts. New parts have the correct level of surface finish. For more information about refinishing front brake rotors, refer to SECTION 5B1.
1. Front brake rotor (27) to steering knuckle spindle.
 2. Washer (29) and nut (31) to steering knuckle (16).

Adjust

- Front wheel bearing. Refer to "Front Wheel Bearing Adjustment" in this section.
3. Cotter pin (55).
 4. Wheel bearing lubricant cap (30).
 5. Front brake caliper. Refer to SECTION 5B1.
 6. Wheel speed sensor to steering knuckle. Refer to SECTION 5E1.

WHEEL BOLT

Figure 24

Remove or Disconnect

(Front Brake Rotor Removed)

NOTICE: Do not attempt to remove the ABS sensor ring from the rotor or ABS system failure may result. Place a shop cloth between the brake rotor machined surfaces and press to avoid damage to the rotor.

- The wheel bolts with a press.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Figure 24 - Pressing Front Wheel Bolt Out

1. New serrated wheel bolt into hole in front brake rotor. Tap lightly with a hammer and punch to start wheel bolt serrations in hole, making sure that wheel bolt is square with front brake rotor flange.
2. Seat bolt using a wheel nut and washer.

LOWER CONTROL ARM

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Spring. Refer to "Springs" in this section.
4. Lower control arm ball stud from steering knuckle. Refer to "Lower Control Arm Ball Stud" under "Control Arm Ball Stud Replacement" in this section.
5. Lower control arm.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. Lower control arm ball stud to steering knuckle. Refer to "Lower Control Arm Ball Stud" under "Control Arm Ball Stud Replacement" in this section.
2. Spring. Refer to "Springs" in this section.
3. Tire and wheel. Refer to SECTION 3E.
4. Lower vehicle.

Adjust

- Wheel alignment. Refer to SECTION 3A.

LOWER CONTROL ARM BUSHINGS

Lower Control Arm Front Bushing

Figures 25 through 27

Disassemble

Tools Required:

- J 21474-5 Bushing Receiver
- J 21474-8 Bushing Remover
- J 21474-19 3/8-Inch Bolt
- J 21474-12 Spacer

1. Remove lower control arm. Refer to "Lower Control Arm" in this section.
2. Using a blunt chisel, drive bushing flare (inside of lower control arm) down flush with rubber of lower control arm front bushing.
3. Remove lower control arm front bushing using J 21474-5, J 21474-8, J 21474-12 and J 21474-19 (Figure 25).

Figure 25 - Removing Front Lower Control Arm Front Bushing

Figure 26 - Installing Front Lower Control Arm Front Bushing

Figure 27 - Front Lower Control Arm Front Bushing Flared

3C-14 FRONT SUSPENSION

Assemble

Tools Required:

J 21474-2 Bushing Remover/Installer
J 21474-13 Control Arm Bushing Installer
J 21474-18 3/8-Inch Nut
J 21474-19 3/8-Inch Bolt
J 21474-12 Spacer

1. Install lower control arm front bushing using J 21474-2, J 21474-12, J 21474-13, and J 21474-18 (Figure 26).
2. Flare lower control arm front bushing using a blunt chisel. (Figure 27).
3. Install lower control arm. Refer to "Lower Control Arm" in this section.

Lower Control Arm Rear Bushing

Figures 28 and 29

Disassemble

Tools Required:

J 21474-5 Bushing Receiver
J 21474-8 Bushing Remover
J 21474-12 Spacer
J 21474-18 3/8-Inch Nut
J 21474-19 3/8-Inch Bolt

1. Remove lower control arm. Refer to "Lower Control Arm" in this section.
2. Remove lower control arm rear bushing using J 21474-5, J 21474-8, J 21474-12, J 21474-18 and J 21474-19 (Figure 28).

Assemble

Tools Required:

J 21474-5 Bushing Receiver
J 21474-12 Spacer
J 21474-13 Control Arm Bushing Installer
J 21474-18 3/8-Inch Nut
J 21474-19 3/8-Inch Bolt

Figure 28 - Removing Front Lower Control Arm Rear Bushing

Figure 29 - Installing Front Lower Control Arm Rear Bushing

1. Install front lower control arm rear bushing using J 21474-5, J 21474-12, J 21474-13, J 21474-18 and J 21474-19 (Figure 29).
2. Install lower control arm. Refer to "Lower Control Arm" in this section.

SHOCK ABSORBERS

Figures 30 and 31

Remove or Disconnect

Tool Required:

J 25591 Shock Absorber Nut Wrench

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Hold the shock absorber upper stem using J 25591 to keep it from turning.
3. Nut (5), retainer (6), and insulator (7).
4. Bolts/screws (34).

• Pull the shock absorber out from the bottom.

Inspect

• Lower control arm nuts. Replace if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. With the retainer (6) and insulator (7) in place over the upper stem, install the shock absorber (fully extended) up through the lower control arm and spring so that the upper stem passes through the mounting hole in the frame.
2. Insulator (7), retainer (6) and nut (5) over the shock absorber upper stem.
3. Using J 25591, hold the upper stem to keep it from turning and tighten the nut (5).

Figure 30 - Front Shock Absorber Attachments

Figure 31 - Removing Shock Absorber Upper Nut

Tighten

- Nut (5) to 11 N.m (97 lb. in.).

- Two bolts/screws (34) attaching the shock absorber lower pivot to the lower control arm.

Tighten

- Bolt/screw (34) to 27 N.m (20 lb. ft.).
- Lower vehicle.

STABILIZER SHAFT AND INSULATORS

Figure 32

Remove or Disconnect

- Raise and suitably support vehicle. Refer to SECTION 0A.
- Each side of stabilizer shaft linkage.
 - Remove nut (48) from bolt/screw (35).
 - Pull bolt/screw (35) from stabilizer shaft linkage.
 - Remove retainers (36), insulators (37) and spacer (45).
- Bolts/screws (43) and clamp (44).
- Stabilizer shaft (46) from frame (62).
- Insulators (47) from stabilizer shaft (46).

Figure 32 - Front Stabilizer Shaft (Typical)

3C-16 FRONT SUSPENSION

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. Insulators (47) to stabilizer shaft (46).
2. Stabilizer shaft (46) to frame (62).
3. Clamp (44) and bolts/screws (43).

Tighten

- Bolts/screws (43) to 33 N.m (24 lb. ft.).
4. Each side of stabilizer shaft linkage.
 - A. Install spacer (45), insulators (37) and retainers (36).
 - B. Insert bolt/screw (35) into stabilizer shaft linkage.
 - C. Install nut (48) to bolt/screw (35).

Tighten

- Nut (48) to 17 N.m (13 lb. ft.).
5. Lower vehicle.

UPPER CONTROL ARM

Figure 33

Remove or Disconnect

Tool Required:
J 23742 Ball Joint Separator

1. Air cleaner and resonator duct, if removing left side upper control arm. Refer to SECTION 6E3-C14.

Important

- Place ignition cylinder in locked position, if removing left side upper control arm, or damage to the SIR coil may result.
2. Intermediate steering shaft, if removing left side upper control arm. Refer to SECTION 3F.
 3. Raise and suitably support vehicle. Refer to SECTION 0A.
 4. Tire and wheel. Refer to SECTION 3E.
 5. Support the lower control arms with jackstands.

Important

- Jack stands must remain under lower control arm spring seat during removal and installation to retain spring and lower control arm in position.
 - The jack stands must be positioned between the spring seat and lower control arm ball stud of the lower control arms for maximum leverage.
6. Wheel speed sensor and secure. Refer to SECTION 5E1.
 7. Loosen nuts (51).

- Remove shims (49) from each bolt/screw (8), tape them together, and mark them for installation to the same position from which they were removed.

8. Steering knuckle and hub upper cotter pin and nut.
9. Separate the upper control arm ball stud from the steering knuckle using J 23742. Refer to "Upper Control Arm Ball Stud" under "Control Arm Ball Stud Replacement" in this section.

NOTICE: Support front brake rotor to prevent weight from damaging front brake hose.

10. Nuts (51).
11. Upper control arm (3).

Install or Connect

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Figure 33 - Front Upper Control Arm

1. Upper control arm (3).
2. Pivot shaft (50) to bolts/screws (8) (Figure 34).
3. Place shims (49) in their original position between the pivot shaft (50) and frame (62) on their respective bolts/screws (8).
4. Nuts (51).

 Tighten

- Nuts (51) to 95 N.m (70 lb. ft.).
5. Remove the temporary support from the front brake rotor, then connect upper control arm ball stud to the steering knuckle. Refer to "Upper Control Arm Ball Stud" under "Control Arm Ball Stud Replacement" in this section.
 6. Wheel speed sensor in steering knuckle. Refer to SECTION 5E1.
 7. Tire and wheel. Refer to SECTION 3E.
 8. Remove jack stands.
 9. Lower vehicle.

 Tighten

- Wheel nuts to 140 N.m (100 lb. ft.).
 - Nuts (52) to 125 N.m (92 lb. ft.) at curb height, only if upper control arm bushings (54) were serviced.
10. Intermediate steering shaft, if removed. Refer to SECTION 3F.
 11. Air cleaner and resonator duct, if removed. Refer to SECTION 6E3-C14.

UPPER CONTROL ARM BUSHINGS

Figures 33, 34 and 35

 Disassemble

Tool Required:

J 22269-01 Tie Rod End Installer

1. Upper control arm. Refer to "Upper Control Arm" in this section.
2. Nuts (52) and retainer (53) (Figure 33).
3. Remove upper control arm bushing (54) from upper control arm (3).
 - A. Position upper control arm (3) and J 22269-01 as shown in Figure 34.
 - B. Push upper control arm bushing (54) from upper control arm (3).

 Assemble

NOTICE: Refer to "Notice" on page 3C-1 of this section.

Tool Required:

J 22269-01 Tie Rod End Installer

1. Upper control arm bushings (54).
 - A. Place pivot shaft (50) in upper control arm (3) with depression in pivot shaft (50) facing inboard.

Figure 34 - Removing Front Upper Control Arm Bushing

Figure 35 - Installing Front Upper Control Arm Bushing

- B. Push new upper control arm bushing (54) into upper control arm (3) and over end of pivot shaft (50) (Figure 35).
2. Nuts (52) and retainers (53) to both ends of pivot shaft (50).
 - Do not tighten.
 3. Upper control arm to vehicle. Refer to "Upper Control Arm" in this section.
 4. Lower vehicle to curb height.

 Tighten

- Nuts (52) to 125 N.m (92 lb. ft.).

FRONT WHEEL BEARINGS

The proper functioning of the front suspension cannot be maintained unless the wheel bearings are correctly adjusted. Cones must be a slip fit on the spindle and the inside diameter of cones should be lubricated to insure that the cones will creep. Spindle nut must be a free-running fit on the threads.

3C-18 FRONT SUSPENSION

Front Wheel Bearing Adjustment

Figures 14 and 36

Adjust

NOTICE: Refer to "Notice" on page 3C-1 of this section.

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Remove wheel cover.
3. Remove wheel bearing lubricant cap (30) from front brake rotor (27).
4. Remove cotter pin (55).

Tighten

- Nut (31) to 16 N·m (12 lb. ft.) while turning the tire and wheel forward by hand to fully seat the bearings. This will remove any grease or burrs which could cause excessive wheel bearing play later (Figure 36).
5. Back off nut (31) to the "just loose" position.
 6. Hand tighten nut (31). Loosen to next slot in nut (31) to fit cotter pin (55).
 7. Install new cotter pin (55) and bend the ends against the nut (31). Cut off extra length to ensure the ends do not interfere with the wheel bearing lubricant cap (30) (Figure 14).

Measure

- Using a dial indicator, check the front brake rotor end play. Place the dial indicator base on the rotor wheel attachment surface. Place the tip on the end of the spindle. Use a "Push-Pull" motion while observing dial indicator. There should be from 0.03 to 0.13 mm (0.001 to 0.005 inch) end play when properly adjusted.

- A FIRST TIGHTEN FRONT WHEEL BEARING NUT TO 16 N·m (12 LB. FT.) WHILE ROTATING WHEEL FORWARD
B THEN BACK FRONT WHEEL BEARING NUT OFF UNTIL JUST LOOSE

4-14-94
BS0363C

Figure 36 - Adjusting Front Wheel Inner and Outer Bearing

8. Install wheel bearing lubricant cap (30) on front brake rotor (27).
9. Install wheel cover.
10. Lower vehicle.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

SOLID REAR AXLE SUSPENSION

Figure 1

The rear axle is attached to the frame with a link suspension system. Two rubber-bushed lower control arms (17) are mounted between the rear axle and the frame. The lower control arms (17) keep the rear axle aligned to the chassis forward and rearward. Two rubber-bushed upper control arms (1) are mounted at an angle between the rear frame crossmember and the rear axle. The upper control arms (1) control driving and braking torque and sideways movement of the rear axle. The upper control arms are available in three lengths for driveline angle corrections. Refer to SECTION 4A for more information.

The upper control arms (1) are shorter than the lower control arms (17), causing the differential housing to rock or tilt forward during acceleration or any other time the rear suspension is compressed. A tunnel in the rear floor pan is used to make room for this rocking or tilting.

Two springs (5) support the weight of the vehicle. The springs (5) are held between brackets on the rear axle tube and frame spring seats. An insulator (4) is installed between the spring (5) and the frame

spring seat at the upper end of the spring (5) and another insulator (40) between the spring (5) and the rear axle tube bracket. Shock absorbers (22) are mounted between brackets on the rear axle tube and the frame spring seats. The tops of the shock absorbers (22) are tilted toward the center of the vehicle. The shock absorbers (22) limit movement of the rear axle. For more information, refer to SECTION 3D1.

A rear axle bumper (26) at the center of the rear frame crossmember and a rear axle bumper (6) near the ends of the axle housing, prevent metal-to-metal contact when the rear suspension is compressed. A stabilizer shaft (12) is mounted between the two lower control arms (17). The stabilizer shaft (12) improves side roll stability.

ON-VEHICLE SERVICE

REAR AXLE HOUSING

For removal and installation of the rear axle housing, refer to SECTION 4B.

REAR AXLE BUMPERS

The outboard rear axle bumpers snap into brackets on the rear axle housing. The center rear axle bumper is held onto a bracket on the rear axle crossmember with a nut. If the bumpers are worn or damaged, they must be replaced.

Figure 1 - Rear Suspension (Typical)

05-12-95
BT0013D

Rear Axle Bumper (Center)

Figure 2

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Nut (24).
3. Rear axle bumper (26).

Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

1. Rear axle bumper (26).
2. Nut (24).

Tighten

- Nut (24) to 20 N.m (15 lb. ft.).
3. Lower vehicle.

Rear Axle Bumper (Outboard)

Figure 2

Remove or Disconnect

- Rear axle bumper (6) by unsnapping it from rear axle bumper bracket.

Figure 2 - Rear Axle Bumpers

Install or Connect

- Rear axle bumper (6) by snapping it into rear axle bumper bracket.

CONTROL ARM BUSHINGS

Figures 3 through 5

Rubber control arm bushings are located at the end of the upper and lower control arms. If the control arm bushings become worn or damaged, they must be replaced.

Remove or Disconnect

Tools Required:

- J 21465-8 Bushing Remover
- J 25317-2 Bushing Remover
- J 25317-1 Bushing Installer

1. Affected control arm. Refer to "Upper Control Arm" or "Lower Control Arm" in this section.

Figure 3 - Rear Axle Control Arm Bushing Flared

Figure 4 - Removing Rear Axle Upper and Lower Control Arm Bushings (Typical)

3D-4 REAR SUSPENSION

- Using a blunt chisel, drive bushing flare (inside of upper or lower control arm) down flush with rubber of upper or lower control arm bushing.
- Upper or lower control arm bushing using J 21465-8, J 25317-2 and a press.

Install or Connect

- Upper or lower control arm bushing using J 25317-1, J 25317-2 and a press.
- Flare front upper or lower control arm bushing using a drift punch.
- Control arm. Refer to "Upper Control Arm" or "Lower Control Arm" in this section.

REAR AXLE BUSHINGS

Figures 1, 6 and 7

Rubber rear axle bushings are installed where the upper control arms are attached to the rear axle. If the rear axle bushings become worn or damaged, they must be replaced.

Figure 5 - Installing Rear Axle Upper and Lower Control Arm Bushings

Figure 6 - Removing Rear Axle Bushing

Tools Required:

- J 21474-19 3/8-Inch Bolt
- J 21474-6 Bushing Carrier
- J 21474-5 Receiver
- J 21474-18 3/8-Inch Nut
- J 21474-20 Bushing Installer

- Raise and suitably support vehicle. Refer to SECTION 0A.
- Support rear axle.
- Automatic level control sensor link from upper control arm (1).
- Nut (3) and bolt/screw (19) holding upper control arm (1) to rear axle (35).
- Move upper control arm out of the way.
- Rear axle bushing (2) using J 21474-19, J 21474-6, J 21474-5 and J 21474-18.

Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

- Rear axle bushing (2) using J 21474-19, J 21474-5, J 21474-20 and J 21474-18.
- Upper control arm (1) to rear axle (35).
- Bolt/screw (19) and nut (3) loosely to upper control arm (1).
- Automatic level control sensor link to upper control arm (1).
- Remove support from rear axle.
- Support tires and lower vehicle until weight of vehicle is on tires.

Tighten

- Bolt/screw (19) to 113 N.m (83 lb. ft.) or nut (3) to 100 N.m (74 lb. ft.).
— Either the bolt/screw (19) or the nut (3) must be tightened. Tighten whichever one is easier to reach while holding the other stationary.

Figure 7 - Installing Rear Axle Bushing

7. Raise and suitably support vehicle. Refer to SECTION 0A.
8. Remove tire supports.
9. Lower vehicle.

SPRINGS

Figures 1, 8 and 9

The springs (5) are held between the rear axle tube and frame spring seat by the weight of the vehicle.

! Important

- If removing both springs (5), remove and replace one spring (5) at a time to prevent the rear axle from moving.

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Support rear axle with an adjustable lifting device.
3. Automatic level control sensor link from upper control arm (1).
4. Rear brake hose fitting bolt/screw at center of rear axle.
 - The rear brake rear pipes do not need to be disconnected. The rear brakes do not have to be bled after this procedure.
5. Nut (21) and washer (20) from shock absorber (22).

6. Shock absorber (22) from bracket.
7. Using adjustable lifting device, lower rear axle enough so spring (5) can be removed.
8. Spring (5) and insulator (4).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

! Important

- Be sure spring leg is installed with tape facing the top. If spring leg is improperly installed, or insulator is missing or damaged, noises may occur.

1. Insulator (4) and spring (5) to bracket on frame spring seat (Figure 8).
 - Point spring leg toward left side of vehicle, perpendicular to centerline of chassis within 5 degrees rearward and 15 degrees forward.
2. Raise rear axle using adjustable lifting device.
3. Shock absorber (22) to bracket.
4. Washer (20) and nut (21) to shock absorber (22).

⌚ Tighten

- Nut (21) to 85 N·m (63 lb. ft.).
5. Rear brake hose fitting bolt/screw.

Figure 8 - Rear Springs

Figure 9 - Automatic Level Control Sensor

3D-6 REAR SUSPENSION

Tighten

- Rear brake hose fitting bolt/screw to 27 N.m (20 lb. ft.).
6. Automatic level control sensor link to upper control arm (1).
 7. Remove adjustable lifting device from under rear axle.
 8. Lower vehicle.

Adjust

- Automatic level control sensor. Refer to SECTION 3D1.

CONTROL ARMS

The upper and lower control arms are held in position with nuts and bolts/screws. When tightening the fasteners, one must be held stationary, while the other is torqued to specification.

Upper Control Arm

Figures 9 and 10

Important

- If both upper control arms (1) are being replaced, remove and replace one at a time to prevent the rear axle from moving sideways.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Support the nose of the rear axle with a jackstand.
3. Automatic level control sensor link from upper control arm (1).
4. Nut (3) and bolt/screw (19) at rear axle housing.

Figure 10 - Rear Axle Upper Control Arm

5. Upper control arm (1) from rear axle housing.
6. Nut (28) and bolt/screw (27).
7. Upper control arm (1) from rear frame crossmember.

Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

1. Upper control arm (1) to rear frame crossmember.
2. Bolt/screw (27) and nut (28) loosely.
3. Upper control arm (1) to rear axle housing.
4. Bolt/screw (19) and nut (3) loosely.
5. Remove jackstand from rear axle.
6. Support the tires and lower the vehicle until the weight of the vehicle is on the tires.

Tighten

- Bolt/screw (27) to 155 N.m (114 lb. ft.) or nut (28) to 130 N.m (95 lb. ft.). Either the bolt/screw (27) or the nut (28) must be tightened. Tighten whichever one is easier to reach while holding the other stationary.
- Bolt/screw (19) to 113 N.m (83 lb. ft.) or nut (3) at rear axle housing to 100 N.m (74 lb. ft.). Either the bolt/screw (19) or the nut (3) must be tightened. Tighten whichever one is easier to reach while holding the other stationary.

7. Automatic level control sensor link to upper control arm (1).

Adjust

- Automatic level control sensor. Refer to SECTION 3D1.
8. Raise and suitably support vehicle. Refer to SECTION 0A.
 9. Remove tire and wheel supports.
 10. Lower vehicle.

Lower Control Arm

Figure 11

Important

- If both lower control arms (17) are being replaced, remove and replace one at a time to prevent the rear axle from moving.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Support rear axle.
3. Stabilizer shaft, if equipped. Refer to "Stabilizer Shaft" in this section.

4. Wheel speed sensor harness from lower control arm (17).
5. Nuts (30) and bolts/screws (29) from bracket on rear axle housing.
6. Nut (30) and bolt/screw (29) from frame (36).
7. Lower control arm (17).

Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

1. Lower control arm (17).
2. Nuts (30) and bolts/screws (29) loosely to bracket on rear axle housing.
3. Nuts (30) and bolts/screws (29) loosely to frame (36).
4. Wheel speed sensor harness to lower control arm (17).
5. Stabilizer shaft to lower control arm, if equipped. Refer to "Stabilizer Shaft" in this section.
6. Remove support from rear axle.
7. Support tires and lower vehicle until weight of vehicle is on the tires.

Tighten

- Bolts/screws (29) to 155 N·m (114 lb. ft.) or nuts (30) to 123 N·m (91 lb. ft.). Either the lower control arm bolts/screws (29) or the lower control arm nuts (30) must be tightened. Tighten the one that is easier to reach while holding the other stationary.
8. Raise and suitably support vehicle. Refer to SECTION 0A.
 9. Remove tire supports.
 10. Lower vehicle.

Figure 11 - Rear Axle Lower Control Arm

STABILIZER SHAFT

Figure 12

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Nuts (10) and washers (11) from bolts/screws (37).
3. Stabilizer shaft (12) from bracket (18).
4. Retainers (38), if necessary.
5. Brackets (18), adapters (16) and bolts/screws (37), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on a page 3D-1 of this section.

1. Brackets (18), adapters (16) and bolts/screws (37), if removed.
2. Retainers (38), if removed.
3. Stabilizer shaft (12) to bracket (18).
4. Washers (11) and nuts (10) to bolts/screws (37).

Tighten

- Nuts (10) to 50 N·m (37 lb. ft.) while holding bolts/screws (37) stationary.
5. Lower vehicle.

SHOCK ABSORBERS

Figure 13

Shock absorbers are filled with fluid and sealed during production. If a shock absorber is worn, damaged or leaking oil, it must be replaced. For operation and diagnosis of shock absorbers, refer to SECTION 3.

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Support rear axle.
3. Air line from air adjustable shock absorber (22), by turning spring clip 90 degrees and pulling gently on air line housing.
4. Nuts (25) and bolts/screws (23) from shock absorber (22) at the frame (36).

NOTICE: When removing the lower attaching rear shock absorber nut the stud must not turn. A hex is located on the stud between the rear axle tube bracket and the shock absorber so that a wrench can be used to keep the stud from turning. Failure to hold the stud may cause damage to the mechanical bond between the shock absorber bushing and the stud.

5. Nut (21) and washer (20) from the shock absorber (22) at the rear axle.

3D-8 REAR SUSPENSION

Figure 12 - Rear Stabilizer Shaft

6. Shock absorber (22).
7. Shield (39) from shock absorber (22), if equipped.

Install or Connect

NOTICE: Refer to "Notice" on page 3D-1 of this section.

1. Shield (39) to shock absorber (22), if removed.
 - Position so that "V" notch near clamp is 180° from air tube fitting and rim of shield is seated against rubber rim of shock absorber boot.
2. Shock absorber (22).
3. Bolts/screws (23) and nuts (25) loosely at frame (36).

NOTICE: When tightening lower attaching rear shock absorber nut, the stud must not turn. A hex is located on the stud between the rear axle tube bracket and the shock absorber so a wrench can be used to keep the stud from turning. Failure to hold the stud may cause damage to the mechanical bond between the shock absorber bushing and the stud.

Figure 13 - Rear Leveling Shock Absorber

4. Washer (20) and nut (21) at rear axle.

Tighten

- Bolt/screw (23) at frame (36) to 24 N.m (18 lb. ft.) or nut (25) at frame (36) to 18 N.m (13 lb. ft.).
- Either the bolt/screw (23) or the nut (25) must be tightened. Tighten whichever one is easier to reach while holding the other stationary.

- Nut (21) at rear axle to 85 N.m (63 lb. ft.).

5. Air line to air adjustable shock absorber (22).

6. Remove support from rear axle.

7. Lower vehicle.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

AUTOMATIC LEVEL CONTROL SYSTEM

The Electronic Level Control (ELC) system is referred to as the automatic level control (ALC) system. The ALC system keeps the rear of the vehicle level by automatically adjusting the rear trim height with varying vehicle loads. The system is activated when the ignition is on and excess weight is added to the vehicle. When the excess weight is removed from the vehicle, a solenoid valve allows air to be released from the system, even with the ignition off. The ALC system, powered by both ignition and battery leads, will be activated until 6 minutes after ignition switch is turned off.

SYSTEM COMPONENT DESCRIPTION

Compressor

Figures 1 and 2

The compressor is a positive displacement rocking piston air pump powered by a 12-volt direct current permanent magnet motor. The compressor head casting contains piston intake and exhaust valves, and is mounted to the left front frame rail by a bracket.

Compressor Relay

Figures 1 and 2

The compressor relay is a single-pole, single-throw type that completes the 12-volt circuit to the compressor motor when energized. The compressor relay is located on the compressor bracket next to the compressor.

Figure 2 - Automatic Level Control Air Compressor - Legend

Sensor

Figure 3

The sensor is an electronic device that controls two basic circuits:

- A. Compressor relay coil.
- B. Exhaust solenoid valve coil ground circuit.

To prevent falsely actuating the compressor relay or solenoid valve circuits during normal ride motions, the sensor circuitry provides an 8 to 15 second delay before either circuit can be completed.

The sensor also limits compressor run time or solenoid valve energized time to a maximum of 6 minutes. This time limit function is necessary to prevent continuous compressor operation in case of severe system leak or continuous exhaust valve operation. Turning the ignition off and on resets the electronic timer to renew the 6-minute maximum run time. The sensor is mounted on the rear crossmember above the rear axle housing. The actuator arm of the sensor is attached to the rear right-hand upper control arm by a link.

- A ARM, AUTOMATIC LEVEL CONTROL SENSOR ACTUATOR
27 SENSOR, AUTOMATIC LEVEL CONTROL

4-15-94
BS0033D1

Figure 3 - Automatic Level Control Sensor

Rear Leveling Shock Absorbers

Figure 4

The shock absorber is essentially a conventional shock absorber enclosed in an air chamber. The shock absorbers are constructed with a rubber-like sleeve attached to the dust tube and shock reservoir. This makes a flexible chamber which will extend the shock when air pressure in the chamber is increased. When air pressure is reduced, the weight of the vehicle collapses the shock absorber. To maintain proper operation and reliability of the shock absorber, a minimum pressure of 55-97 kPa (8-14 psi) is maintained at all times by the air dryer. Due to the

close routing of the exhaust system, a heat shield has been placed around the shock absorber boot to protect it from being burned.

Solenoid Valve

Figure 5

The solenoid valve is located within the compressor head and provides two functions:

1. Exhaust air from the system when the coil is energized.
2. Limit maximum output pressure of the compressor by acting as a pressure relief valve.

3D1-4 ELECTRONIC LEVEL CONTROL SYSTEM

Figure 4 - Rear Leveling Shock Absorber

Air Dryer

Figure 6

The air dryer is attached externally to the compressor output and provides two functions:

1. Absorbs moisture from the air being delivered to the shock absorbers and then returns this moisture to the atmosphere when the air is released.
2. Maintains a 55 - 97 kPa (8 - 14 psi) minimum air pressure in the shock absorbers by means of a valve contained within the air dryer housing.

Tubing and Fittings

Figure 7

Snap-on connectors are used to attach the tubing to the rear shock absorbers. The connector housings contain retainer clips. When a tubing is attached to a shock fitting, the retainer clip snaps into a groove in the shock fitting, locking the tubing in position. All tubing fittings are sealed with two O-rings.

Air Compressor Filter

Figures 1, 2 and 8

Air enters the ALC system through the filter (10) mounted to the outer air compressor bracket. The filter housing contains a foam filter which prevents contaminants from entering the ALC system.

Figure 5 - Automatic Level Control Solenoid Valve

Figure 6 - Automatic Level Control Air Compressor Air Dryer

SYSTEM OPERATION

Raising Vehicle

When a load is added to the vehicle, the vehicle body is forced downward, causing the sensor actuating arm to rotate upward. The upward movement of the sensor actuating arm activates the internal timing circuit. After an initial delay of 8 to 15 seconds, the sensor completes the compressor relay circuit to ground. With the relay energized, the circuit to the compressor is complete and the compressor runs, taking in air through the air compressor filter and sending it through the tubings to the shock absorbers.

Figure 7 - Automatic Level Control Tubing and Fittings

As the shock absorbers inflate, the rear of the vehicle moves upward, rotating the sensor actuating arm back toward its original position prior to the load addition. Once the body reaches its original height (+/- 1 inch), the sensor opens the compressor relay circuit and shuts off the compressor.

Lowering Vehicle

When an excess load is removed from the rear of the vehicle, the body is forced upward, causing the sensor actuating arm to rotate downward. The downward rotation of the actuating arm activates the internal timing circuit. After an initial delay of 8 to 15 seconds, the sensor completes the solenoid valve circuit to ground. With the solenoid valve energized, air begins to exhaust out of the shock absorbers back through the air dryer, the solenoid valve, the air compressor filter and into the atmosphere. As the rear of the vehicle lowers, the sensor actuating arm is rotated downward toward its original position. When the vehicle body reaches its original height (+/- 1 inch), the sensor opens the solenoid circuit, de-energizing the solenoid valve, which prevents any further air from escaping.

Air Replenishment Cycle

The air replenishment cycle serves to ensure that the shock absorbers are filled with at least minimum residual pressure. The sensor commands an air replenishment cycle each time the ignition switch is turned on. Sensor position is checked when the ignition switch is turned on. If the sensor indicates that it is not necessary to raise or lower the vehicle, an internal timer circuit is activated. After a 35 to 40 second delay, the compressor is turned on for approximately 4 seconds. This ensures that the shock absorbers are filled with adequate residual pressure.

If weight is added to, or removed from, the vehicle during the initial 35 to 40 second delay, the air replenishment cycle will be overridden and the vehicle will raise or lower after the normal delay.

Figure 8 - Automatic Level Control Air Compressor Filter

Compressor Head Relief

To ensure low compressor motor starting current, a 1.5 second actuation of the solenoid valve will occur each time the compressor is to start. The 1.5 second actuation of the solenoid valve reduces the air pressure in the compressor head cavity.

Short Circuit Protection

To protect against a short circuit in the relay, exhaust valve or wiring harness, self-protection is built into the sensor output circuits. When an overcurrent condition is detected, the respective output is turned off for an additional time delay (10 to 20 seconds). The circuit is again turned on. If the fault is still there, the protection circuit will repeat through the time delay. This will continue for 32 cycles at which time the shortened output will be disabled until an ignition reset. If used with the tester J 34825, the presence of an output fault (short circuit) as described above will be indicated on the tester by flashing the trim output light until the fault is removed.

DIAGNOSIS

When certain tests require raising the vehicle on a hoist, the hoist should support the rear wheels or axle housing. When a frame type hoist is used, two additional jack stands are required to support the rear axle housing in its normal curb weight position. Refer to SECTION 3 for trim height specifications.

Refer to SECTION 8A for electrical troubleshooting of the ALC system.

ALC SYSTEM OPERATIONAL CHECK

ALC SYSTEM OPERATIONAL CHECK

Perform the following preliminary inspections before doing the system operation check.

**Inspect**

1. ALC sensor connector and ensure connection is secure.
2. ALC sensor link and ensure that link is properly secured to actuator arm.
3. ALC sensor actuator arm for damage.
4. Select suitable location at rocker panel just in front of rear wheel and measure distance to floor.
5. Turn ignition switch to "RUN" position.
6. Add load of 135 to 158 kg (300 to 350 lbs.) to rear of vehicle.
 - A. After 8 to 15 seconds, compressor should turn on and vehicle should begin to rise.
 - B. By the time compressor shuts off, vehicle should rise within 19 mm (3/4 inch) of unloaded measurement made in step 4.
7. Remove load applied in step 6.
 - A. After 8 to 15 seconds, vehicle should start to lower.
 - B. The vehicle should lower to within 19 mm (3/4 inch) of unloaded measurement made in step 4 in less than 8 to 15 seconds.

SENSOR OPERATIONAL CHECK**Figure 9**

1. Turn ignition switch to "OFF" then "RUN" position to reset sensor timing circuit.
2. Raise and suitably support vehicle. Refer to SECTION 0A.

**Important**

- Ensure rear wheels or axle housing are supported so that vehicle is at its normal trim height.
3. Disconnect link from sensor arm.
 4. Ensure that sensor wiring harness connectors are secure.
 5. Move sensor arm up.
 - A. After 8 to 15 seconds, compressor should turn on and shock absorbers should start to inflate.
 - B. If compressor does not run, refer to SECTION 8A.
 6. As soon as shock absorbers are filled, move sensor arm down until compressor stops.
 7. Move sensor arm down below position where compressor stopped.
 - After 8 to 15 seconds, shock absorbers should start to deflate.
 8. Connect link to sensor arm.
 9. Lower vehicle.

3D1-8 ELECTRONIC LEVEL CONTROL SYSTEM

SYSTEM LEAK TEST

Figure 10

Tool Required:

J 22124-B Pressure Gage

The following test will determine if there is a leak in the system and whether the leak is internal or external to the compressor.

1. Connect air tube supplied with J 22124-B to air dryer fitting with shut-off valve placed between air dryer fitting and J 22124-B gage.
2. Connect air tube leading to shock absorbers to other end of J 22124-B.
3. With shut-off valve open (up), apply shop air pressure through service valve on gage until gage reads 690 to 827 kPa (100 to 120 psi).
4. If leak is indicated, close shut-off valve and continue to observe for pressure drop. This isolates compressor from remainder of system.
 - A. If gage pressure continues to drop, leak is external to compressor. Leak test all ALC system and shock absorber connections with soap and water or leak test solution.
 - B. If gage pressure does not drop further, leak is internal to compressor. Refer to "Compressor Leak Test" in this section.
5. If pressure builds up rapidly but vehicle does not raise, check for pinched air tubes and/or restriction to the shock absorbers.

COMPRESSOR PERFORMANCE TESTS

Compressor Current Draw, Pressure Output and Leakdown Test

Figure 10

Tool Required:

J 22124-B Pressure Gage

The compressor performance tests check the operation of the compressor by measuring compressor current draw, compressor output and pressure leakdown. Perform the following test set-up:

1. Remove compressor from vehicle. Refer to "Compressor" under "On-Vehicle Service" in this section.
2. Connect air tube supplied with J 22124-B to air dryer fitting so that gage on J 22124-B is situated between air dryer fitting and shut-off valve.
3. Disconnect air compressor relay.
4. Connect ammeter to a 12-volt source and to compressor. Refer to Figure 10.
5. Refer to the following chart.

Figure 10 - Automatic Level Control Air Compressor Current Draw, Pressure Output and Leakdown Test Connections

Compressor Leak Test

Figures 1, 2, 10 and 11

Tool Required:

J 22124-B Pressure Gage

NOTICE: Refer to "Notice" on page 3D1-1 of this section.

1. Remove compressor from vehicle. Refer to "Compressor" under "On-Vehicle Service" in this section.
2. Connect J 22124-B to air dryer and close valve before applying shop air.
3. Apply 690 kPa (100 psi) of compressed air through service valve on J 22124-B.
4. Using soap bubble solution, inspect following items for leaks:

A EDGE OF AUTOMATIC LEVEL CONTROL AIR
COMPRESSOR AIR DRYER COVER
B AUTOMATIC LEVEL CONTROL SOLENOID VALVE
ENTRANCE

C EDGE OF AUTOMATIC LEVEL CONTROL AIR
COMPRESSOR HEAD COVER GASKET
D EDGE OF AUTOMATIC LEVEL CONTROL AIR
COMPRESSOR HEAD COVER BOLT/SCREW

4-15-94
BS0133D1

Figure 11 - Automatic Level Control Air Compressor Leak Test

Inspect

- Air dryer cover.
- Area around air dryer port.
- Edge of compressor head cover gasket.
- Edge of solenoid valve terminal housing and lead entrance.
- Head casting air intake and exhaust opening.
- Head cover bolts/screws (20) for proper tightening.

Tighten

- Bolts/screws (20) on head cover, if required, to 4 N.m (35 lb. in.).

3. Connect air tube leading to shock absorbers to other end of J 22124-B.
4. Turn ignition switch to "RUN" position.
5. Disconnect link from crank arm and move crank arm upward to inflate shock absorber.
6. Move crank arm downward to deflate shock absorber.
7. Read pressure on J 22124-B.
8. Turn ignition switch to "OFF" position and deflate system through service valve on J 22124-B.

A. Pressure gage should read 55 - 97 kPa (8 - 14 psi) after system is deflated.

B. If pressure is not within specification, replace air dryer.

9. Lower vehicle.

AIR DRYER PERFORMANCE TEST

Residual Air Check

Tool Required:

J 22124-B Pressure Gage

The air dryer has a valve arrangement that maintains 55 - 97 kPa (8 - 14 psi) in the shock absorbers to improve the ride under light load conditions. To test this function, perform the following procedures:

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Remove tubing connector from air dryer fitting and connect tube supplied with J 22124-B to air dryer fitting.

ON-VEHICLE SERVICE

TUBING AND FITTINGS

The tubing is connected to the air dryer and routed to the left rear shock absorber along the length of the left-hand frame by snap-in provisions on the brake/fuel/vapor clips. Another tubing connects the rear shock absorbers and is routed along the rear crossmember. The tubing includes spring clip connections with molded sealing shoulders in the retainer. On the end of each tubing is double O-ring seals.

AUTOMATIC LEVEL CONTROL AIR COMPRESSOR CURRENT DRAW, PRESSURE OUTPUT AND LEAKDOWN TEST

Before making any tubing disconnections, clean the connector and surrounding area. Turn the spring clip to release the connector. To reassemble, lubricate the O-rings with petroleum jelly and push the tubing and connector fully into the fitting.

TUBING REPAIR

Figure 12

Service repair kits contain a length of tubing with a snap-on type fitting and the necessary parts for splicing the tubing to an existing line.

1. Detach existing tubing from air filter and cut and remove all leaking hose areas.
2. Cut the new tubing to length, using a razor blade or very sharp knife.
3. Splice the new tubing to the existing tubing.
4. Remove plastic retainer pin from one of nuts and slide replacement tubing into nut until it bottoms in rubber seal.
5. Maintaining tubing in position described above, tighten nut securely onto service coupling.
 - During tightening of nut a collar on internal metal sleeve breaks loose. When collar breaks loose, continue to tighten nut until it's secure.
6. Attach original tubing to other end of coupling as described above.
7. Using tie strap, secure tubing to vehicle in location where it will not be pinched or contact exhaust system.

Figure 12 - Automatic Level Control Tubing Repair

SENSOR

3D1-12 ELECTRONIC LEVEL CONTROL SYSTEM

3. Electrical connector from rear harness.
4. Nut (37) retaining link (35) to upper control arm (36).
5. Bolts/screws (38) retaining sensor (27) to rear crossmember.
6. Sensor (27) from rear crossmember.

 Install or Connect

NOTICE: Refer to "Notice" on page 3D1-1 of this section.

1. Sensor (27) to rear crossmember.
2. Bolts/screws (38) retaining sensor (27) to rear crossmember.

Tighten

- Bolts/screws (38) to 14 N.m (124 lb. in.).
3. Link (35) to upper control arm (36).
 4. Nut (37) retaining link (35) to upper control arm (36).

 Tighten

- Nut (37) to 3 N.m (27 lb. in.).
5. Electrical connector to rear harness.
 6. Lower vehicle.
 7. Battery negative cable.
 8. Adjust sensor. Refer to “Sensor Adjustment” in the following procedure.

Sensor Adjustment

Figure 14

The attaching link should be securely connected to the sensor arm when any adjustments are made. For every 1 degree change in the arm angle, the trim height will change by approximately 6 mm (1/4 inch). The arm angle may be changed a total of 5 degrees, resulting in a trim height change of approximately 32 mm (1 1/4 inch).

Adjust

1. Sensor (27).
 - A. Loosen nut (29) securing metal arm to plastic arm.
 - B. To decrease amount of rear suspension travel required to turn on compressor (to raise vehicle trim height), move plastic arm to top of slot and tighten nut (29).
 - C. To increase amount of travel required to turn on compressor (to lower vehicle trim height), move plastic arm to bottom of slot and tighten nut (29).

GENERAL DESCRIPTION

The factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including the full load capacity when inflated to the recommended inflation pressures. Correct tire pressures and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration, and unnecessarily sharp braking increase tire wear.

REPLACEMENT TIRES

Figure 1

A tire performance criteria (TPC) specification number is molded in the sidewall near the tire size of all original equipment tires. This specification number assures that the tire meets GM's performance standards for traction, endurance, dimension, noise, handling, rolling resistance, and others. Usually, a specific TPC number is assigned to each tire size.

Replacement tires should be the same size, speed rating, load range and construction as the original tires. Replace the original tires with tires of the same

Figure 1 - Tire Identification

3E-2 TIRES AND WHEELS

TPC specification number. Use of any other tire size, speed rating or type may seriously affect ride, handling, speedometer/odometer calibration, antilock brake system, vehicle ground clearance, trailering capability, and tire clearance to the body and chassis. Listed below are common speed rating symbols and corresponding maximum speeds.

Speed Symbol	Maximum Speed (km/h)	Maximum Speed (mph)
S	160	112
T	190	118
U	200	124
H	210	130
V	240	149
Z	Over 240	Over 149

CAUTION: Do not mix different types of tires on the same vehicle, such as radial, bias, and bias-belted tires, except in emergencies because vehicle handling may be seriously affected and may result in loss of control. This caution does not apply to the compact spare furnished with the vehicle.

Tires Should Be Replaced When:

1. They are worn to a point where 1.6 mm (1/16 inch) or less tread remains, or the cord or fabric is showing. To help detect this condition, tires have built-in tread wear indicators that appear between the tread grooves when the tread is worn to 1.6 mm (1/16 inch) or less. When the indicators appear in two or more adjacent grooves at three spots around the tire, the tire should be replaced.
2. The tread or sidewall is cracked, cut or snagged deeply enough to expose the cord or fabric.
3. The tire has a bump, bulge or split. Slight sidewall indentations are normal and should not affect ride.
4. The tire has a puncture, cut or other damage that cannot be correctly repaired because of the size or location of the damage.

It is recommended that new tires be installed in pairs on the same axle. If only one tire is replaced, it should be paired with the tire having the most tread.

ALL SEASON TIRES

Figure 1

All Chevrolet Caprices, Impalas and Buick Roadmasters are equipped with steel belted all season radial tires as standard equipment. These tires qualify as snow tires, with a 37 percent higher average rating for snow traction than non-all season radial tires used previously. Other performance areas, such as wet traction, rolling resistance, tread life and air retention, were also improved slightly. These improvements were

made by changing both tread design and tread compounds. These tires are identified by an "M + S" molded in the tire sidewall following the size. The suffix "MS" is also molded in the sidewall after the TPC specification number.

PUNCTURE SEALING TIRES

(Buick Wagon)

Figure 2

The puncture sealing tire is designed to permanently seal most tread punctures up to 3/16 inch in diameter, so that the tire remains inflated. The actual sealant is made up of a special rubber compound, which is applied to the tire in the tire manufacturing plant. The sealant only covers the inside of the tire under the tread area. The sealant is designed to surround the imbedded object and seal the puncture at the inner surface of the tire below the tread. When an object 3/16 or less penetrates the tire, it picks up a coating of sealant. As the puncturing object is either removed or thrown out by centrifugal force, the sealant sticks to it and is pulled into the puncture opening in the tread. This sealant fills the puncture and permanently seals the tire, keeping it completely inflated.

P-METRIC TIRES

Figure 3

All Chevrolet Caprices, Impalas and Buick Roadmasters use passenger-metric (P-metric) sized tires. P-metric tires are available in two load ranges: standard load and extra load. All models use standard load tires, hearses use extra load tires. The words "STANDARD LOAD" or "EXTRA LOAD" are molded into the tire, usually near the tire bead, or the letters "XL" may appear after the tire size.

The metric term for tire inflation pressure is the kilopascal (kPa). Tire pressure may be printed in both kPa and psi. One psi equals 6.9 kPa. Refer to the tire placard or "Specifications" in this section for tire inflation pressures.

Figure 2 - Puncture Sealing Tires (Buick Wagon)

TIRE CHAIN USAGE

Use of chains may adversely affect vehicle handling. Due to limited tire-to-body clearance on this vehicle, tire chain usage recommendations have been published in the Owner's Manual. When chains are to be used, use SAE Class "S" tire chains. These chains are specially designed to limit the "fly off" effect that occurs when the wheel rotates. Manufacturers of tire chains have a specific chain size for each tire size to ensure proper fit when installed. Therefore, specific chains should be obtained for the tire on which they are to be used. Rubber adjusters should not be used to take up slack or clearance in chains which are loose due to incorrect size. Always follow the chain manufacturers installation instructions.

WHEN CHAINS ARE INSTALLED:

1. Adjust speed to road conditions
2. Avoid sharp turns
3. Install the chains on the front tires as tightly as possible, then tighten them again after driving 0.4 to 0.8 km (1/4 to 1/2 mile).

Figure 3 - Metric Tire Size Format

4. Do not exceed 70 km/h (45 mph), or the chain manufacturer's speed limit, if lower.
5. Drive in a restrained manner and avoid large bumps, potholes, severe turns and other maneuvers which could cause the tires to bounce up and down.
6. Follow any other instructions of the chain manufacturer which do not disagree with the above.
7. If you can hear the chains contacting the vehicle, stop and retighten them. If the contact continues, slow down until it stops. Additional specific information is published in the Owner's Manual.

TIRE PLACARD

Figure 4

The tire placard is permanently located on the rear face of the driver's door, and should be referred to for tire information. The placard lists the maximum vehicle load, tire size (including spare), and cold inflation pressure (including spare).

WHEELS

Wheels must be replaced if they are bent, dented, have excessive lateral or radial runout, leak air through welds (porosity leaks in aluminum wheels can be repaired), have elongated bolt holes, or if the wheel nuts will not stay tight. Wheels with runout greater than specified may cause objectionable vibrations.

Replacement wheels must be equivalent to the original equipment wheels in load capacity, diameter, rim width, offset, and mounting configuration. A wheel of incorrect size or type may affect bearing life, brake cooling, speedometer/odometer calibration, antilock brake system, vehicle ground clearance and tire clearance to the body and chassis.

ON-VEHICLE SERVICE

WHEEL REPAIR

Wheel repairs that use welding, heating or peening are not approved. An inner tube is not an acceptable repair for leaky wheels or tires. Porosity in aluminum wheels can be repaired. Refer to "Aluminum Wheel Porosity Repair" in this section.

METRIC WHEEL NUTS AND WHEEL BOLTS

A metric wheel nut is identified by the word "Metric" stamped on its face. The wheel bolt has the letter "M" stamped into its end. The thread size of the metric wheel nuts and bolts are indicated by a code, such as M12 x 1.5 which designates the diameter (12 mm), and the distance between threads (1.5 mm).

3E-4 TIRES AND WHEELS

Figure 4 - Tire Placard

WHEEL BOLT REPLACEMENT

CAUTION: If any wheel bolt is damaged by a loose-running tire and wheel, all the wheel bolts for that wheel should be replaced. A loose-running wheel may break only one wheel bolt, but the other wheel bolts may be damaged internally. Replacing only the broken wheel bolt and remounting the wheel may cause further damage and personal injury.

Front Wheel Bolt

For the front wheel bolt replacement procedure, refer to SECTION 3C.

Rear Wheel Bolt

For the rear wheel bolt replacement procedure, refer to SECTION 4B.

TIRE INFLATION

The pressure recommended for all models is carefully calculated to give a comfortable ride, responsive steering, and maximum tread wear, tire life and resistance to bruises. Valve stem caps or extensions should be installed on the valve stems to keep out dust and water. Tire pressure, with tires cold (after vehicle has set for three hours or more, or

driven less than one mile), should be checked monthly or before any extended trip and set to the specifications on the tire placard located on the rear face of driver's door or in "Specifications" in this section. Tire pressure will increase about 6.9 kPa (1 psi) for every 5.5° C (10° F) temperature increase.

For sustained high-speed driving, tires should be set at the pressures recommended. Sustained driving at high speeds, where permitted by law, is not advised unless vehicle has special high-speed tires.

HIGHER THAN RECOMMENDED PRESSURE CAN CAUSE:

1. Hard ride.
2. Reduced handling.
3. Tire bruising or carcass damage.
4. Rapid tread wear at center of tire.

LOWER THAN RECOMMENDED PRESSURE CAN CAUSE:

1. Tire squeal on turns.
2. Hard steering.
3. Rapid and uneven wear on the edge of the tread.
4. Tire rim bruises and rupture.
5. Tire cord breakage.
6. High tire temperatures.
7. Reduced handling.
8. High fuel consumption.

UNEQUAL PRESSURE ON SAME AXLE CAN CAUSE:

1. Uneven braking.
2. Steering lead.
3. Reduced handling.
4. Swerve on acceleration.

WHEEL REMOVAL AND INSTALLATION

Figures 5 and 6

Penetrating oil has not been found to be effective in removing tight wheels. However, if it is used, it should be applied sparingly to the wheel center hole area only.

CAUTION: If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum, it could cause the wheel to work loose as the vehicle is driven, resulting in a loss of control and an injury accident. Never use heat to loosen a tight wheel. It can shorten the life of the wheel, wheel bolts, spindle and bearing and/or seals.

Figure 5 - Tires and Wheels

Wheel nuts must be tightened in sequence and to the proper torque to avoid bending the wheel or rotor. Sometimes wheels can be difficult to remove due to foreign material or a tight fit between the wheel centerhole and the rotor. Excessive force such as hammering the wheel can cause damage and is not recommended. Slight tapping on the tire sidewall using a large rubber mallet is acceptable. The wheel can be removed without damage as follows:

REMOVING TIGHT WHEEL

1. Retighten all wheel nuts on the affected wheel. Then loosen each wheel nut two turns. Rock the vehicle side to side. If this is not effective, go to step 2.
2. Rock the vehicle from "DRIVE" to "REVERSE" allowing the vehicle to move several feet in each direction. Apply quick hard jabs on the brake pedal to loosen the wheel. If the wheel still does not free up, then rock the vehicle again from side to side as hard as possible using one or more person's body weight. If the wheel is still tight, repeat the procedure.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Cover insert (13 or 14) if equipped.
 - Pry off cover insert.
3. Bolt/screw (11), if equipped.
 - Use wrench (12) located in instrument panel compartment to remove bolt/screw (11).
4. Cover (7, 8 or 9), if equipped.
 - Pry off cover (7, 8 or 9).
5. Hub cap (6) on aluminum wheel, if equipped.
 - Pry off.
6. Wheel nuts (5).
7. Bracket (4), if equipped.
8. Security wheel lock nut (3), if equipped.
9. Tire and wheel (1 or 2).
10. Bolts/screws (10), if equipped.
11. Hub cap (9), if equipped.

3E-6 TIRES AND WHEELS

CAUTION: Before installing a wheel, remove any buildup of corrosion on the wheel mounting surface and drum or rotor by scraping and wire brushing. Installing wheels without good metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen, which may later allow the wheel to come off while the vehicle is in motion.

Clean

- Wheel nuts (5), wheel bolts and drum or rotor mounting surfaces.

Install or Connect

NOTICE: Refer to "Notice" on page 3E-1 of this section.

1. Hub cap (9), if removed.
2. Bolts/screws (10), if removed.

Tighten

- Bolts/screws (10) to 25 N.m (18 lb. ft.).
3. Tire and wheel (1 or 2).

CAUTION: Never use oil or grease on wheel bolts or wheel nuts. Tighten the wheel nuts with your fingers until they are snug. Then, tighten the wheel nuts (in the sequence shown) to the specified torque. Refer to "Specifications" in this section. Improperly tightened wheel nuts could eventually allow the wheel to come off while the vehicle is moving, possibly causing loss of control, personal injury and property damage.

4. Security wheel lock nut (3), if equipped.

Tighten

- Security wheel lock nut (3) to 140 N.m (100 lb. ft.).
5. Bracket (4), if removed.
 6. Wheel nuts (5).

Tighten

- Wheel nuts (5) in sequence to 140 N.m (100 lb. ft.).
7. Hub cap on aluminum wheel, if removed.
 - Use a rubber mallet to fully seat.
 8. Cover (7, 8 or 9), if removed.
 - Use a rubber mallet to fully seat.
 9. Bolt/screw (11), if removed.
 - Use wrench in instrument panel compartment to install bolt/screw (11).
 10. Cover insert (13 or 14), if removed.
 11. Lower vehicle.

Figure 6 - Five Hole Wheel Nut Tightening Sequence

TIRE ROTATION

Figure 7

To equalize wear, rotate tires at intervals specified in SECTION 0B. Whenever uneven tire wear is noticed, the cause should be investigated. Figure 7 shows the only methods of tire rotation recommended. Due to their design, radial tires tend to wear faster in the shoulder area, particularly in drive locations. Radial tires in non-drive locations may develop an irregular wear pattern that can generate tire noise. This wear makes regular rotation especially important.

Figure 7 - Tire Rotation

If the vehicle has a compact spare tire, use four wheel rotation. If the vehicle is equipped with a full-size spare tire and wheel, include the spare tire and wheel in the rotation. After rotation, be sure to check wheel nut torque and set tire pressure. Never use oil or grease on wheel bolts or wheel nuts. Refer to "Wheel Removal and Installation" in this section.

TIRE MOUNTING AND DISMOUNTING

Figure 8

Use a tire changing machine to mount or dismount tires. Follow the equipment manufacturer's instructions. Do not use hand tools or tire irons to change a tire as they may damage the tire beads, wheel rim or flanges.

NOTICE: Do not lubricate the tire beads or wheel rim with a lubricant containing silicone. Silicone will allow the tire to rotate on the rim, throwing the wheel and tire out of balance. Rim bead seats should be cleaned with a wire brush or coarse steel wool to remove old rubber and light rust or corrosion. Before mounting or dismounting a tire, the bead area should be well lubricated with GM P/N 9985555 (50 percent lubricant and 50 percent water) or equivalent. After mounting, inflate tire so that beads are completely seated, but never exceed 280 kPa (40 psi).

CAUTION: To avoid serious personal injury, do not stand over tire when inflating. The bead may break when it snaps over safety hump. Do not exceed 280 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 280 kPa (40 psi) pressure will not seat beads, deflate, relubricate and inflate. Overinflation may cause the bead to break and cause serious personal injury.

Figure 8 - Tire Locating Ring

Install the valve stem and inflate to the pressure specified on the tire placard. Check the locating rings of the tire and wheel to be sure they show around the rim flanges on both sides of the tire and wheel.

TIRE REPAIR

There are many different materials and techniques on the market to repair tires, but not all work on some types of tires. Tire manufacturers have published detailed instructions on how and when to repair tires. The instructions can be obtained from the tire manufacturer. Repair to the compact spare tire is not recommended.

MEASURING WHEEL RUNOUT

Figure 9

Wheel runout should be measured with an accurate dial indicator. Measurements may be taken with the wheel installed on the vehicle, or off the vehicle using an accurate mounting surface such as a wheel balancer. Measurements may be taken with or without the tire mounted on the wheel.

Radial runout and lateral runout should be measured on both the inboard and outboard rim flanges. With the dial indicator firmly in position, slowly rotate the wheel one revolution and record the total indicator reading. If any measurement exceeds specifications, and there is a vibration that wheel balancing will not correct, the wheel should be replaced. Disregard any indicator readings caused by welds, paint runs, or scratches.

Figure 9 - Wheel Runout

3E-8 TIRES AND WHEELS

ALUMINUM WHEEL RUNOUT SPECIFICATION

- Radial runout 0.76 mm (0.030 inch)
- Lateral runout 0.76 mm (0.030 inch)

STEEL WHEEL RUNOUT SPECIFICATION

- Radial runout 1.01 mm (0.040 inch)
- Lateral Runout 1.14 mm (0.045 inch)

SPARE TIRE

All vehicles are equipped with either a compact spare tire or a full-size spare tire. The full-size spare tire is the same as the other tires but the wheels may be different (steel vs aluminum) on the vehicle. The compact spare tire uses a narrow 4-inch wide rim, although the wheel diameter is usually one inch larger than the road wheels.

NOTICE: The compact spare tire should not be used with standard tires and wheels, snow tires, wheel covers or trim rings. If such use is attempted, damage to these items or other parts of the vehicle may occur. The compact spare tire should be used only on vehicles that offer it as original equipment.

Inflation pressure of the compact spare tire must be periodically checked and maintained at 420 kPa (60 psi). It can be mounted and dismounted from its wheel using present tire changing equipment and procedures. As with other tires, the beads should completely seat at 280 kPa (40 psi).

CAUTION: To avoid serious personal injury, do not stand over tire when inflating. Bead may break when it snaps over safety hump. Do not exceed 280 kPa (40 psi) pressure when inflating any tire, including compact spare tires if beads are not seated. If 280 kPa (40 psi) pressure will not seat beads, deflate, relubricate and inflate. Overinflation may cause bead to break and cause serious personal injury.

The compact spare tire is designed to weigh less than standard tires and wheels and is easier to handle when need arises. Check inflation pressure as soon as practical after installing compact spare tire and adjust to 420 kPa (60 psi). Replacement of the compact spare tire should be made only by an authorized tire dealer.

NOTICE: Do not take the vehicle through an automatic car wash with the compact spare tire installed. The vehicle may get caught, which could result in property damage.

BALANCING TIRE AND WHEEL

Figures 10, 11 and 12

There are two methods used to balance tires and wheels: static and dynamic. Static balance is the equal distribution of weight around the wheel. Tires and wheels that are statically unbalanced cause a bouncing action called tramp.

Figure 10 - Static Unbalance Correction

Dynamic balance is the equal distribution of weight on each side of the centerline so that when the tire and wheel spins there is no tendency for the tire and wheel to move from side to side. tires and wheels that are dynamically unbalanced may cause shimmy.

General Balance Precautions

CAUTION: It is recommended that eye protection be used to prevent personal injury.

Deposits of foreign material must be cleaned from the inside of the wheel. Stones should be removed from the tread in order to avoid operator injury during spin balancing and to obtain a good balance. The tire and wheel should be inspected for any damage, then balanced according to the equipment manufacturer's recommendations. Only polyester coated "MC" type wheel weights should be used on aluminum wheels.

Off-Vehicle Balancing

When balancing tires and wheels off the vehicle, use a balancer that pilots the wheel by the centerhole (not the wheel bolt holes) if possible. Always follow the equipment manufacturer's instructions. Some electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers, but do not correct for rotor unbalance. If the vibration is not corrected by the off-vehicle balance, an on-vehicle balance may also be needed.

Figure 11 - Dynamic Unbalance Correction

On-Vehicle Balancing

When needed, on-vehicle balancing will help correct vibrations due to drum or rotor imbalance.

When balancing on-vehicle, do not remove the wheel balance weights from the off-vehicle dynamic balance. If more than one ounce of additional weight is required, it should be split between the inner and outer rim flange.

The driven tires and wheels should be spun using the engine. Limit speed as stated in the following "Caution."

CAUTION: On vehicles equipped with limited slip rear axles, do not attempt to balance a tire and wheel on a drive wheel with the other drive wheel on the ground. The vehicle may drive through this wheel and cause the vehicle to move unexpectedly, resulting in personal injury and property damage.

CAUTION: Do not spin the drive wheels faster than 55 km/h (35 mph) as indicated by the speedometer. This limit is necessary because the speedometer indicates only one-half of the actual wheel speed when one drive wheel is spinning and the other drive wheel is stopped. Personal injury and damage may result from high speed spinning.

! Important

- The vehicle may be equipped with a limited-slip rear axle. To distinguish between a standard rear axle and a limited-slip rear axle, raise the rear of vehicle so both tires are clear of the ground. With the transmission in "PARK," attempt to turn one wheel by hand. If the wheel can be turned easily, it is a standard rear axle; if the tire and wheel cannot be turned easily, it is a limited-slip rear axle. Also, check for limited-slip rear axle (G80) on the Service Parts Identification label.

Wheel Balance Weights

Figure 12

When static balancing, if more than 85 grams (3.0 ounces) are needed, the wheel balance weights should be split as equally as possible between the inboard and outboard flanges.

Aluminum wheels must be balanced using special polyester-coated clip-on wheel balance weights. These wheel balance weights are designed to fit over the thicker inboard and outboard rim flanges of the aluminum wheel and should be installed with a teflon coated hammer.

CORRECTING NON-UNIFORM TIRES

There are two ways to correct tires which cause a vibration even though they are properly balanced. One method uses an automatic machine which loads

Figure 12 - Aluminum Wheel Balance Weight

3E-10 TIRES AND WHEELS

the tire and buffs small amounts of rubber from the stiff spots on the outer two tread rows. Correction by this method is usually permanent and, if done properly, does not significantly affect the appearance or tire tread life. Tire truing for free runout with a blade-type machine is not recommended as this reduces the tread life substantially and often does not permanently correct the problem. Another method is to dismount the tire and rotate it 180 degrees on the rim. It is important that this be done only on tires and wheels which are known to be causing a vibration as it is just as likely to cause good tires and wheels to vibrate. Refer to SECTION 3 for more details.

ALUMINUM WHEELS

Porosity Repair

Remove or Disconnect

1. Tire and wheel. Refer to "Wheel Removal and Installation" in this section.
2. Locate leaking areas by inflating tire to 280 kPa (40 psi) and dipping into water bath.
3. Mark leak areas.
4. Mark the tire at the tire valve stem.
5. Tire from wheel. Refer to "Tire Mounting and Dismounting" in this section.
6. Scuff inside rim surface at leak area with number 80 grit sandpaper and clean area with general purpose cleaner such as 3M® P/N 08984 or equivalent.
7. Apply 3 mm (1/8-inch) thick layer of adhesive/sealant GM P/N 1052366 or equivalent to leak test area and allow six hours of drying time.

Install or Connect

1. Tire to wheel. Refer to "Tire Mounting and Dismounting" in this section.
2. Align the match mark on the tire with the tire valve stem.
3. Pressurize to 280 kPa (40 psi) and check for leaks.
4. Adjust tire pressure to meet specifications on tire placard.
5. Balance tires and wheels. Refer to "Balancing Tire and Wheel" in this section.
6. Tire and Wheel. Refer to "Wheel Removal and Installation" in this section.

Wheel Refinishing

A protective clear or color coating is applied to the surface of original equipment cast aluminum wheels. A surface degradation condition can begin to develop if frequent, repeated automatic car wash cleaning abrades or wears off the factory applied protective clear coating. Once the protective clear coating is damaged, exposure to caustic cleaners and/or road salt further causes surface degradation. The service procedures detail how to strip, clean and recoat aluminum wheels that are affected by the above

condition. Select and follow only those procedures for the conditions that apply to the wheels you are refinishing.

REQUIRED MATERIALS

- Amchem Alumi Prep number 33 - stock number DX533 or equivalent - cleaning and conditioning chemical for aluminum.
- Amchem Alodine number 1001 - stock number DX501 or equivalent - coating chemical for aluminum.
- Ditzler Delclear Acrylic Urethane Clear - stock number DAU-75 or equivalent.
- Ditzler Delthane Ultra-Urethane Additive - stock number DXR-80 or equivalent.

INITIAL PREPARATION

Remove or Disconnect

1. Tire and wheel from the vehicle. Refer to "Wheel Removal and Installation" in this section.
2. Outboard wheel balance weights.

Clean

- Wheel inside and out with a water base all purpose cleaner. Remove grease or oil with a solvent cleaner.

ACCENT COLOR PREPARATION

- Sand over painted areas that do not require recoloring with number 400 grit wet or dry sandpaper to promote adhesion of clear coat.

SURFACE DAMAGE

CAUTION: Do not use vehicle power to rotate the wheel while sanding or personal injury may result.

1. Mount wheel on brake lathe and spin slowly.

NOTICE: Do not use abrasive coarser than 80 grit or wheel may be damaged.

2. Sand wheel with backing block or pad by holding abrasive flat to surface of wheel and moving slowly back and forth from center to outer edge to remove imperfections.
 - A. First, sand with number 80 grit sandpaper.
 - B. Follow with number 150 grit sandpaper.
 - C. Finish with number 240 grit sandpaper.

SLIGHT CLEAR COAT DAMAGE ON UNPAINTED WHEELS

CAUTION: Use of rubber gloves and eye protection is necessary to prevent personal injury.

1. Apply chemical stripper.
 - A. Allow stripper to penetrate coating.

- B. Use a small 1/4-inch detail brush dipped in stripper to apply material around the perimeter and spoke-like areas.
2. Remove stripper, following the manufacturer's recommendations.

CAUTION: Do not use vehicle power to rotate the wheel while sanding or personal injury may result.

3. Sand the wheel with number 240 grit sandpaper while rotating the wheel on a slowly spinning brake lathe or by mounting it on the vehicle and spinning it by hand.
- This restores the machined appearance and promotes adhesion of the finish coats.

RECOATING PROCEDURE

CAUTION: Use of rubber gloves and eye protection is necessary to prevent personal injury.

1. Clean the surface of contaminants by washing with soap and water.
2. Spray the wheel with Amchem number 33 or equivalent.
 - A. Let the wheel soak for 1 to 3 minutes.
 - B. Rinse with water and blow dry.
3. Spray the wheel with Amchem number 1001 or equivalent.
 - A. Let the wheel soak 1 to 3 minutes.
 - B. Rinse with water and blow dry.
4. Mask off the tire.

CAUTION: When applying any two part component paint system, wear proper respiratory protection such as Easi-Air Respirator, part number 06986, or equivalent. Follow the specific precautions provided by the paint manufacturer. Failure to follow these precautions may cause lung irritation and allergic respiratory reaction.

5. Finish the wheel with Ditzler Delclear acrylic urethane clear and Ditzler ultra urethane additive, or equivalent. Refer to labels for specific directions.
- A. First coat - light mist coat, let flash.
 - B. Second coat - light, let flash.
 - C. Third coat - heavy duty, wet coat.
6. Let the wheel dry for 24 hours or flash for 30 minutes. Force dry at 60° C (140° F) for 30 minutes, and allow to cool for 30 minutes before mounting.

Install or Connect

1. Balance tire and wheel. Refer to "Balancing Tire and Wheel" in this section.
 - Replace the original wheel balance weights with polyester-coated wheel balance weights to avoid discoloration of the wheel.
2. Tire and Wheel. Refer to "Wheel Removal and Installation" in this section.

SECTION 3F

STEERING WHEEL AND COLUMN ON-VEHICLE SERVICE

CAUTION: The procedures in this section must be followed in the order listed to temporarily disable the Supplemental Inflatable Restraint (SIR) System and prevent false diagnostic trouble codes from setting. Failure to follow procedures could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

STEERING COLUMN

Figure 1

The locking energy-absorbing steering column includes three important features in addition to the steering function.

1. In a front-end collision, the energy-absorbing steering column is designed to collapse, minimizing the possibility of injury to the driver.
2. The ignition switch, steering column lock and ignition cylinder are column mounted, allowing the steering wheel and ignition to be locked, to inhibit theft of the vehicle.

3F-2 STEERING WHEEL AND COLUMN - ON VEHICLE SERVICE

Figure 1 - Steering Column with SIR and Steering Wheel Rotation Sensor

05-13-95
BT0013F

3. The turn signals, headlamp dimmer switch, cruise control system, windshield wiper and windshield washer system can all be controlled through the multi-function lever on the steering column.

To ensure the energy-absorbing action, use only the specified bolts/screws and nuts and tighten them to the specified torque. Apply a thin coat of lithium grease to all friction points when reassembling.

When the steering column is removed from the vehicle, handle it with special care. Using a steering wheel puller other than the one recommended in this manual, hitting the end of the steering shaft or automatic transmission control lever sharply, leaning on the steering column, or dropping the steering column could shear or loosen the plastic fasteners that keep the steering column rigid.

The Variable Effort Steering (VES) steering wheel rotation sensor (available as Buick option only), senses the rotational speed of the steering shaft, to return to full assist, during sudden directional changes at highway speeds.

IGNITION LOCK SYSTEM

Figure 2

All column shift automatic transmission vehicles contain a mechanical neutral start system. This system relies on a mechanical block to prevent starting the engine in other than "PARK" or "NEUTRAL." The mechanical block is a wedge shape finger added to the ignition switch actuator rod. In either "PARK" or "NEUTRAL," the wedge shape finger passes through the bowl plate slots, allowing the steering column lock and ignition cylinder to turn to start the engine. If the automatic transmission control lever is in any position other than "PARK" or "NEUTRAL," the wedge shape finger will not pass through the bowl plate preventing the ignition switch rod from moving the ignition switch to the start position.

- A PARK POSITION
- B NEUTRAL POSITION
- C PLATE, BOWL
- 20 CYLINDER, STEERING COLUMN LOCK AND IGNITION
- 27 RACK, SWITCH ACTUATOR
- 28 FINGER, WEDGE SHAPE
- 29 ROD, SWITCH ACTUATOR
- 47 SECTOR, SWITCH ACTUATOR

4-18-94
BS0023F

Figure 2 - Mechanical Neutral Start System

**BRAKE TRANSMISSION SHIFT
INTERLOCK (BTSI)**

The Brake Transmission Shift Interlock (BTSI) system prevents the driver from shifting out of "PARK" without pressing the brake pedal. The BTSI solenoid is energized when the ignition is on and the vehicle is in "PARK." When energized, the BTSI solenoid on column shift vehicles, moves a cable which mechanically locks the gear shift bowl to the column. On floor shift vehicles, the solenoid is mounted to the floor shifter, and mechanically locks the shifter from moving. When pressure is applied to the brake pedal, the BTSI solenoid is de-energized, and releases the gearshift lever bowl, or floor shifter.

**SUPPLEMENTAL INFLATABLE RESTRAINT
(SIR)**

The Supplemental Inflatable Restraint (SIR) helps supplement the protection offered by the driver's seat belt by deploying an air bag from the center of the steering wheel during certain frontal crashes. Refer to SECTION 9J for passenger side airbag information. The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle.

The steering column is collapsible and should be inspected after an accident whether or not a deployment has occurred.

The SIR system components in the steering wheel and column are the:

1. Inflatable restraint steering wheel module.
2. The SIR coil.

To obtain a detailed description of these components refer to SECTION 9J.

LUBRICATION

Apply a thin coat of lithium grease to all friction points when reassembling components.

DIAGNOSIS**REPAIRS AND INSPECTIONS REQUIRED
AFTER AN ACCIDENT**

To obtain a detailed explanation of the repairs and inspections which must be performed after an accident on SIR-equipped vehicles, whether or not a deployment has occurred, refer to SECTION 9J.

**SUPPLEMENTAL INFLATABLE RESTRAINT
(SIR)**

To diagnose faults within the SIR System, refer to SECTION 9J.

IGNITION LOCK SYSTEM

To diagnose faults within the Ignition Lock System, refer to SECTION 3.

**BRAKE TRANSMISSION SHIFT
INTERLOCK (BTSI)**

To diagnose the BTSI refer to SECTION 8A.

ON-VEHICLE SERVICE**SERVICE PRECAUTIONS**

CAUTION: When performing service on or around SIR components or SIR wiring, follow the procedures listed below to temporarily disable the SIR system. Failure to follow procedures could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

The Sensing and Diagnostic Module (SDM) can maintain sufficient voltage to cause a deployment after the ignition switch is turned "OFF" or the battery is disconnected. Many of the service procedures require disconnection of the "AIR BAG" fuse and the inflatable restraint steering wheel module circuits from the deployment loops to avoid an accidental deployment.

Disabling the SIR System**Remove or Disconnect**

1. Turn steering wheel so that vehicle's wheels are pointing straight ahead.
2. Turn ignition switch to "LOCK."
3. "AIR BAG" fuse from fuse block.
4. Left-hand sound insulator (Buick only). Refer to SECTION 8C.
5. Connector Position Assurance (CPA) and yellow 2-way connector for both connectors located near base of steering column.

**Important**

- With "AIR BAG" fuse removed and ignition switch in "RUN," the "AIR BAG" lamp in the instrument cluster will light. This is normal operation and does not indicate an SIR fault.

Enabling the SIR System**Install or Connect**

1. Turn ignition switch to "LOCK."
2. Both yellow 2-way connectors located near base of steering column and corresponding Connector Position Assurance (CPA).
3. Left-hand sound insulator (Buick only). Refer to SECTION 8C.
4. "AIR BAG" fuse to fuse block.
5. Turn ignition switch to "RUN" and verify that the "AIR BAG" lamp in the instrument cluster flashes 7 times and then turns off. If it does not operate as described, perform "SIR" Diagnostic System Check. Refer to SECTION 9J.

LIVE (UNDEPLOYED) INFLATABLE RESTRAINT STEERING WHEEL MODULE

Special care is necessary when handling and storing a live (undeployed) inflatable restraint steering wheel module. The rapid gas generation produced during deployment of the air bag could cause the inflatable restraint steering wheel module, or an object in front of it, to be thrown through the air in the unlikely event of an accidental deployment.

CAUTION: When carrying a live inflatable restraint steering wheel module, make sure the bag opening is pointed away from you. Never carry the inflatable restraint steering wheel module by the wires or electrical connector on the underside of it. In case of an accidental deployment, the bag will then deploy with minimal chance of injury. When placing a live inflatable restraint steering wheel module on a bench or other surface, always face the bag and trim cover up, away from the surface. Never rest a steering column on the steering wheel with the inflatable restraint steering wheel module face down and steering column vertical. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment.

DEPLOYED INFLATABLE RESTRAINT STEERING WHEEL MODULE

After the inflatable restraint steering wheel module has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of corn starch (used to lubricate the bag as it inflates) and by-products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by-product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment. As with many service procedures, you should wear gloves and safety glasses.

INFLATABLE RESTRAINT STEERING WHEEL MODULE SHIPPING PROCEDURES

Service personnel should refer to the latest service bulletins for proper SIR inflatable restraint steering wheel module shipping procedures. For further information, refer to SECTION 9J

INFLATABLE RESTRAINT STEERING WHEEL MODULE SCRAPPING PROCEDURES

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) inflatable restraint steering wheel module. This information covers proper

procedures for disposing of a live inflatable restraint steering wheel module. Before a live inflatable restraint steering wheel module can be disposed of, it must be deployed. Live inflatable restraint steering wheel modules must not be disposed of through normal refuse channels.

CAUTION: Failure to follow proper Supplemental Inflatable Restraint (SIR) steering wheel module disposal procedures can result in air bag deployment which may cause personal injury. Undeployed inflatable restraint steering wheel modules must not be disposed of through normal refuse channels. The undeployed inflatable restraint steering wheel module contains substances that can cause severe illness or personal injury if the sealed container is damaged during disposal. Disposal in any manner inconsistent with proper procedures may be a violation of federal, state, and/or local laws.

If a vehicle is the subject of a Product Liability Report related to the SIR system and is subject to a Preliminary Investigation (GM-1241), DO NOT DEPLOY the inflatable restraint steering wheel module and DO NOT ALTER the SIR system in any manner. Refer to the applicable service bulletin on SIR shipping procedures for details on handling SIR systems involved with GM-1241. If a vehicle is the subject of a campaign affecting inflatable restraint steering wheel modules, DO NOT DEPLOY the inflatable restraint steering wheel module. Follow instructions in the campaign service bulletin for proper disposition of the inflatable restraint steering wheel module.

If an inflatable restraint steering wheel module is replaced under warranty, DO NOT DEPLOY the air bag. The inflatable restraint steering wheel module may need to be returned, undeployed, to Inland Fisher Guide. Refer to procedures shown in the appropriate service bulletin regarding SIR shipping procedures. In situations which require deployment of a live (undeployed) inflatable restraint steering wheel module, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in "Deployment Outside Vehicle" and "Deployment Inside Vehicle" in SECTION 9J.

WIRING REPAIRS

If the wiring pigtail (wires attached directly to the component, not by a connector) on either the inflatable restraint steering wheel module or the SIR coil is damaged, the entire component must be replaced. Absolutely no wire, connector, or terminal repairs are to be attempted on either the inflatable restraint steering wheel module or the SIR coil. For more information, refer to SECTION 9J.

3F-6 STEERING WHEEL AND COLUMN - ON VEHICLE SERVICE

SHIFT INDICATOR ADJUSTMENT

Figure 3

↔ Remove or Disconnect

Instrument panel steering column opening filler.
Refer to SECTION 8C.

🔑 Adjust

- Shift indicator.
 - A. Steering column attachment should be complete before adjusting shift indicator.
 - B. Automatic transmission control lever should be in "N" gate notch.
 - C. Position shift indicator clip (115) on edge of gearshift lever bowl (49) to centrally position the "N" indicator. (Chevrolet - between dots on bottom of "N," Buick - orange indicator completely filling "T").
 - D. Push shift indicator clip (115) onto gearshift lever bowl (49).

Figure 3 - Shift Indicator Adjustment

- E. Make sure shift indicator cable (114) rests on gearshift lever bowl (49), not on jacket (17).

↔ Install or Connect

Instrument panel steering column opening filler.
Refer to SECTION 8C.

IGNITION AND DIMMER SWITCHES

Figures 2 through 6 and 15

↔ Remove or Disconnect

1. Disable SIR system. Refer to "Disabling the SIR System" in this section.
2. Instrument panel driver knee bolster and deflector. Refer to SECTION 8C.
3. Ensure cylinder (20) is in "LOCK" position.
4. Shift indicator cable (114).
5. Nuts (56) from steering column bracket (18).
6. Lower steering column (5).
7. Electrical connectors from dimmer switch (87) and ignition switch (81).
8. BTSI solenoid. Refer to SECTION 3F5A or 3F5B.
9. BTSI solenoid bracket. Refer to SECTION 3F5A or 3F5B.
10. Bolt/screw (82) from dimmer switch (87).
11. Actuator rod (84).

Figure 4 - Removing Ignition and Dimmer Switches

12. Dimmer switch (87).
13. Stud (85) from ignition switch (81).
14. Actuator rod (86).
15. Ignition switch (81).

Install or Connect

1. Ensure ignition switch (81) is in "LOCK" position.
 - Move switch slider to extreme right position (accessory), and then move slider one detent to left.
2. Ensure cylinder (20) is in "LOCK" position.
3. Ignition switch (81) to jacket (17).
4. Actuator rod (86) to ignition switch (81).
5. Stud (85) to ignition switch (81) until snug.
6. Dimmer switch (87) to ignition switch (81).
7. Bolt/screw (82) to dimmer switch (87).
8. Cycle cylinder (20) through all switch positions to ensure correct ignition switch adjustment.

Adjust

- Ignition switch (81), if necessary. Loosen bolt/screw (82) and stud (85) and slide ignition switch (81) up or down until cylinder (20) functions properly in all switch positions.

Tighten

- Bolt/screw (82) to 4 N.m (35 lb. in.).
 - Stud (85) to 4 N.m (35 lb. in.).
9. Actuator rod (84) to dimmer switch (87).

Adjust

- Dimmer switch (87), if necessary.
 - A. Loosen bolt/screw (82).
 - B. Insert a 3/32 in. drill bit into dimmer switch (87) to limit dimmer switch travel as shown in figure 6.
 - C. Slide dimmer switch (87) up until all slack is removed.

Figure 5 - Ignition Switch Adjustment

Tighten

- Bolt/screw (82) to 4 N.m (35 lb. in.).
10. Verify proper operation by pulling back on multi-function lever.
 - A click should be heard when lever is pulled to activate high and low beams.
 11. BTSI solenoid bracket. Refer to SECTION 3F5A or 3F5B.
 12. BTSI solenoid. Refer to SECTION 3F5A or 3F5B.
 13. Electrical connectors to dimmer switch (87) and ignition switch (81).
 14. Raise steering column (5).
 15. Nuts (56) to steering column bracket (18).

Tighten

- Nuts (56) to 27 N.m (20 lb. ft.).
16. Shift indicator cable (114).

Adjust

- Shift indicator. Refer to "Shift Indicator Adjustment," in this section.
17. Instrument panel driver knee bolster deflector. Refer to SECTION 8C.
 18. Enable SIR system. Refer to "Enabling the SIR System" in this section.

TURN SIGNAL LEVER

Figure 7

Remove or Disconnect

1. Tilt wheel release lever by grasping firmly and turning counterclockwise.
2. Cap (45).
3. Electrical connector.
4. Lever (3) by pulling straight out of turn signal switch.
 - Make sure that lever (3) is in center or "OFF" position.

Install or Connect

1. Lever (3) by pushing into turn signal switch.

Figure 6 - Dimmer Switch Adjustment

3F-8 STEERING WHEEL AND COLUMN - ON VEHICLE SERVICE

2. Electrical connector.
3. Cap (45).
4. Tilt wheel release lever by grasping firmly and turning clockwise.

HAZARD WARNING SWITCH

Refer to SECTION 3F5A or 3F5B. The hazard warning switch does not require removal of the steering column for replacement.

HAZARD WARNING SWITCH KNOB

Figure 8

Remove or Disconnect

1. Bolt/screw (21).
2. Button (22).

Install or Connect

NOTICE: Refer to "Notice" on page 3F-1 of this section.

1. Button (22).
2. Bolt/screw (21).

Tighten

- Bolt/screw (21) to 0.7 N·m (6 lb. in.).

Figure 7 - Turn Signal Lever Wiring Connection

AUTOMATIC TRANSMISSION CONTROL LEVER

Figure 9

Remove or Disconnect

1. Pin (202) from housing (200).
2. Transmission control lever (19) and spring (203) out of housing (200), being careful not to lose spring (203).

Install or Connect

1. Spring (203).
2. Transmission control lever (19).
 - A shim may be used to aid in installation by holding spring (203) in place.
3. Pin (202).
4. Remove shim if used.

INFLATABLE RESTRAINT STEERING WHEEL MODULE

Figure 10

Remove or Disconnect

1. Disable SIR system. Refer to "Disabling the SIR System" in this section.
2. Loosen bolts/screws (60) from back of steering wheel (2) using number T30 TORX® driver (or equivalent) until module (1) can be released from steering wheel (2).
3. Module (1) from steering wheel (2).

Figure 8 - Removing Hazard Warning Switch Knob

Figure 9 - Automatic Transmission Control Lever

CAUTION: When carrying a live inflatable restraint steering wheel module, make sure the bag opening is pointed away from you. Never carry the inflatable restraint steering wheel module by the wires or electrical connector on the underside of it. In case of an accidental deployment, the bag will then deploy with minimal chance of injury. When placing a live inflatable restraint steering wheel module on a bench or other surface, always face the bag and trim cover up, away from the surface. Never rest a steering column on the steering wheel with the inflatable restraint steering wheel module face down and steering column vertical. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment.

4. Electrical connector and retainer (30) from module (1).

5. Module (1) horn lead from horn contact/canceling cam tower.

- Push in and rotate counter clockwise 1/4 turn, then pull out.

Install or Connect

NOTICE: Refer to "Notice" on page 3F-1 of this section.

1. Module (1) horn lead to horn contact/canceling cam tower.
 - Push in and rotate clockwise 1/4 turn.
2. Electrical connector and retainer (30) to module (1).
3. Route coil lead around mounting post and secure under clip.
4. Module (1) to steering wheel (2).

Important

- Ensure that wiring is not exposed or trapped between module (1) and steering wheel (2).

Tighten

- Bolts/screws (60) to 6 N.m (53 lb. in.).
5. Enable SIR system. Refer to "Enabling the SIR System" in this section.

STEERING WHEEL

Figures 1 and 11

Tools Required:

- J 1859-A Steering Wheel Puller
- J 38720 Steering Wheel Puller Bolts
(Part of J 1859-A)

Remove or Disconnect

1. Inflatable restraint steering wheel module. Refer to "Inflatable Restraint Steering Wheel Module" in this section.
2. Nut (26).

NOTICE: When removing the steering wheel, use only the specified steering wheel puller. Under no conditions should the end of the steering shaft be hammered on, as hammering could loosen the plastic injections which maintain steering column rigidity.

NOTICE: When attaching J 1859-A and J 38720 to the steering wheel, use care to prevent threading J 38720 (bolts) all the way through the steering wheel hub and into the SIR coil, damaging the SIR coil.

3. Steering wheel (2), using J 1859-A and J 38720.

Install or Connect

NOTICE: Refer to "Notice" on page 3F-1 of this section.

Figure 10 - Inflatable Restraint Steering Wheel Module

1. Route SIR coil electrical connector through steering wheel (2).
2. Steering wheel (2).
 - Align index mark on steering wheel (2) with index mark on steering shaft.
3. Nut (26).

Tighten

- Nut (26) to 41 N.m (30 lb. ft.).

4. Inflatable restraint steering wheel module. Refer to "Inflatable Restraint Steering Wheel Module" in this section.

STEERING WHEEL ROTATION SENSOR (BUICK OPTION)

Figure 12

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

NOTICE: Ensure that the vehicle's wheels are pointing straight ahead and the ignition switch is in the "LOCK" position. Failure to do so may allow the steering wheel to rotate, causing damage to the SIR coil.

1. Battery negative cable.
2. Bolt/screw (6) and nut (8) from coupling (7) attaching upper intermediate steering shaft (9) to lower steering shaft (16).
3. Upper intermediate steering shaft (9) from lower steering shaft (16).
4. Electrical connector.
5. Clip (57).
6. Sensor (58).

Figure 11 - Removing Steering Wheel

 Install or Connect

NOTICE: Refer to "Notice" on page 3F-1 of this section.

1. Sensor (58).
2. Clip (57).
3. Upper intermediate steering shaft (9) to lower steering shaft (16).
4. Electrical connector.
 - Secure connector.
5. Bolt/screw (6) and nut (8) to coupling (7).

 Tighten

- Nut (8) to 54 N.m (40 lb. ft.).
- 6. Battery negative cable.

INTERMEDIATE STEERING SHAFT*Figures 13 and 14*
 Remove or Disconnect

NOTICE: Ensure that the vehicle's wheels are pointing straight ahead and the ignition switch is in "LOCK" position. Failure to do so may cause the steering wheel to rotate, causing damage to the SIR coil.

1. Shield (11) from steering gear return pipe nut.
2. Bolt/screw (14) from coupling (13) attaching lower intermediate steering shaft (12) to steering gear (55).
 - Push lower intermediate steering shaft (12) rearward to disengage latch from steering gear (55).
3. Bolt/screw (6) and nut (8) from coupling (7) attaching upper intermediate steering shaft (9) to steering column.
4. Intermediate steering shaft.

 Disassemble

1. Upper intermediate steering shaft (9) and lower intermediate steering shaft (12) by pressing a 3/8 in. diameter rod up through bottom of coupling (13).
2. Seal (10), spring (54) and shield (11).

 Assemble

1. Before assembling the lower intermediate steering shaft (12) and upper intermediate steering shaft (9), apply lithium grease to spring (54).
2. Spring (54), seal (10) and shield (11).
3. Upper intermediate steering shaft (9) and lower intermediate steering shaft (12).
 - Align slot in coupling (13) in relation to coupling (7).
 - Press together.

Figure 12 - Steering Wheel Rotation Sensor (Buick)

3F-12 STEERING WHEEL AND COLUMN - ON VEHICLE SERVICE

Figure 13 - Replacing Intermediate Steering Shaft

Figure 14 - Disassembling Intermediate Steering Shaft

Install or Connect

NOTICE: Refer to "Notice" on page 3F-1 of this section.

1. Coupling (13) to steering gear worm-shaft splined ends.
 - Align the flat on coupling (13) with the flat on wormshaft.

Important

- Ensure vehicle's wheels are pointing straight ahead.
2. Bolt/screw (14).

Tighten

- Bolt/screw (14) to 31 N.m (23 lb. ft.).
3. Bolt/screw (6) and nut (8) to coupling (7) attaching upper intermediate steering shaft (9) to steering column.

Tighten

- Nut (8) to 54 N.m (40 lb. ft.).
4. Shield (11).
 - Latch of shield (11) must be seated around steering gear return pipe nut.

STEERING COLUMN REMOVAL

Figures 1, 3, 6, 15 and 16

NOTICE: The wheels of the vehicle must be straight ahead and the ignition switch in the "LOCK" position before disconnecting the steering column or intermediate steering shaft from the steering gear. Failure to do so will cause the SIR coil to become uncentered, which will cause damage to the SIR coil.

NOTICE: When the steering column is removed from the vehicle, it is extremely susceptible to damage. Dropping the steering column on its end could collapse the steering shaft or loosen plastic injections that keep the steering column rigid. Leaning on the steering column could cause jacket to bend or deform. Any of the above conditions could impair steering column's collapsible design. If the steering wheel must be removed, use only the specified steering wheel puller and steering wheel puller bolts. Never hammer on the end of the shaft because hammering could loosen plastic injections that keep the steering column rigid.

Remove or Disconnect

1. Disable the SIR system. Refer to "Disabling the SIR System" in this section.

- A SIR CONNECTION
- 2 WHEEL, STEERING
- 15 BOLT/SCREW, STEERING COLUMN LOWER SUPPORT
- 17 JACKET, STEERING COLUMN
- 18 BRACKET, STEERING COLUMN
- 56 NUT, STEERING COLUMN BRACKET

Figure 15 - Removing Steering Column

3F-14 STEERING WHEEL AND COLUMN - ON VEHICLE SERVICE

05-19-95
BT0103F

Figure 16 - Steering Column Wiring Connections

NOTICE: Remove the stoplamp switch before removing the steering column. Failure to do so may cause the stoplamp switch to be damaged or thrown out of adjustment, resulting in a malfunctioning stoplamp switch or premature brake wear.

2. Stoplamp switch. Refer to SECTION 5.
3. Instrument panel steering column opening filler. Refer to SECTION 8C.
4. Instrument panel driver knee bolster and deflector. Refer to SECTION 8C.
5. Steering wheel rotation sensor electrical connector (Buick option).
6. Bolt/screw (6) and nut (8) from pot joint coupling (7) attaching upper intermediate steering shaft (9) to steering column (5).
7. Shift indicator cable (114) from steering column (5).
8. Nuts (56) attaching steering column bracket (18) to instrument panel carrier and lower the steering column (5).
9. Park lock cable from steering column (Impala SS only). Refer to SECTION 7A.
10. Electrical connectors.
11. Automatic transmission range selector rod from steering column (except Impala SS). Refer to SECTION 7A.
12. Bolts/screws (15) attaching jacket (17) to the cowl.
13. Steering column (5) from vehicle.

Install or Connect

NOTICE: If a service replacement steering column is being installed, do not remove the anti-rotation pin until after the steering column has been connected to the steering gear. Removing the anti-rotation pin before the steering column is connected to the steering gear may damage the SIR coil.

NOTICE: Refer to "Notice" on page 3F-1 of this section.

1. Steering column (5) into vehicle.

2. Bolts/screws (15) attaching jacket (17) to cowl.

Tighten

- Bolts/screws (15) to 6.5 N-m (58 lb. in.).
3. Electrical connectors.
 4. Park lock cable to steering column (Impala SS only). Refer to SECTION 7A.
 5. Nuts (56) attaching steering column bracket (18).

Tighten

- Nuts (56) to 27 N-m (20 lb. ft.).
6. Shift indicator cable (114) to steering column (5).
 7. Bolt/screw (6) and nut (8) to coupling (7) attaching upper intermediate steering shaft (9) to steering column (5).

Tighten

- Nut (8) to 54 N-m (40 lb. ft.).
8. Remove anti-rotation pin if service replacement steering column (5) is being installed.
 9. Steering wheel rotation sensor electrical connector (Buick option).
 10. Automatic transmission range selector rod to steering column (except Impala SS). Refer to SECTION 7A.

Adjust

- Shift linkage. Refer to SECTION 7A.
11. Stoplamp switch. Refer to SECTION 5.
 12. Instrument panel driver knee bolster and deflector. Refer to SECTION 8C.
 13. Instrument panel steering column opening filler. Refer to SECTION 8C.
 14. Remove hexagon locking nut, if a service replacement steering column is being installed.
 15. Remove SIR coil shipping cover and disengage connector from cover, if a service replacement steering column is being installed.
 16. Steering wheel, if removed. Refer to "Steering Wheel" in this section.
 17. Enable SIR system. Refer to "Enabling the SIR System" in this section.

SECTION 3F5A

SUPPLEMENTAL INFLATABLE RESTRAINT TILT STEERING COLUMN COLUMN SHIFT UNIT REPAIR

CAUTION: The procedures in this section must be followed in the order listed to temporarily disable the Supplemental Inflatable Restraint (SIR) System and prevent false diagnostic codes from setting. Failure to follow procedures could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Before removing or installing any electrical unit or when a tool or equipment could easily come in contact with "live" exposed electrical terminals, disconnect the negative battery cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the "off" or "lock" position.

NOTICE: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

	206-GREASE SERV KIT, BTSI

Figure 2 - Tilt Steering Column - Legend

SUB SECTION A - UPPER COLUMN

INCLUDES:

DISABLING THE SIR SYSTEM
ENABLING THE SIR SYSTEM
INFLATABLE RESTRAINT COIL ASSEMBLY
SHAFT LOCK
TURN SIGNAL CANCELLING CAM ASM
UPPER BEARING SPRING
UPPER BEARING INNER RACE SEAT
INNER RACE
TURN SIGNAL SWITCH ASSEMBLY
BUZZER SWITCH ASSEMBLY
STRG COL PASS KEY LOCK CYL SET
CENTERING INFL RESTRAINT COIL

Tools Required:

J 23653-SIR Lock Plate Compressor

SERVICE PRECAUTIONS

CAUTION: When performing service on or around SIR components or SIR wiring, follow the procedures listed below to temporarily disable the SIR system. Failure to follow procedures could result in possible air bag deployment, personal injury or unneeded SIR repairs.

The SDM can maintain sufficient voltage to cause a deployment for up to 10 seconds after the ignition switch is turned "OFF" or the battery is disconnected. Many of the service procedures require disconnection of the "AIR BAG" fuse and the inflator module circuits from the deployment loops to avoid an accidental deployment.

Disabling The SIR System

Remove or Disconnect

- Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
 - Turn ignition switch to "LOCK" and remove key
1. "AIR BAG" fuse from I/P fuse block.
 2. Left-hand sound insulator assembly, refer to SECTION 8C.
 3. Both connector position assurance (CPA) retainers and yellow 2-way SIR connectors located near base of the steering column.

Important

- With the "AIR BAG" fuse removed and ignition switch "ON", the "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SIR system malfunction.

Enabling The SIR System

Install or Connect

- Turn ignition switch to "LOCK" and remove key.
1. Both yellow 2-way SIR connectors and corresponding (CPA) retainers located near base of steering column.
 2. Left-hand sound insulator assembly, refer to SECTION 8C.
 3. "AIR BAG" fuse to I/P block.
 - Turn ignition switch to "RUN" and verify that the "AIR BAG" warning lamp flashes 7 times and then turns "OFF". If it does not operate as described, perform the "SIR Diagnostic System Check" in SECTION 9J-A.

Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

Remove or Disconnect *Figures 1 through 8 and 12*

NOTICE: Place ignition to "LOCK" position to prevent uncentering SIR coil assembly (3).

1. Disable the SIR system; refer to "Disabling the SIR System" in this Section.
2. Negative (-) battery cable.

Figure 3 - Removing Coil Assembly Off Shaft

Figure 5 - Removing Components from Upper Shaft

3. Coil assembly retaining ring (2).
4. Inflatable restraint coil assembly (3).
 - Let switch hang freely if removal is not needed.
 - To remove coil assembly (3), do steps 5 through 17 in this section.
5. Wave washer (4).
6. Shaft lock retaining ring (5) using J 23653-SIR to push down shaft lock (6).
 - Dispose of ring (5).
7. Shaft lock (6).
8. Turn signal cancelling cam assembly (7).
9. Upper bearing spring (8).

Figure 4 - Removing Shaft Lock Retaining Ring

10. Upper bearing inner race seat (13).
11. Inner race (14).
12. Turn signal to "RIGHT TURN" position (up).
13. Multi-function lever and hazard knob assembly. (See Section 3F)
14. Flat head tapping screw (10), cross recess tapping screw (27) and signal switch arm (11).
15. Turn signal switch screws (9).

Figure 6 - Turn Signal Switch Removal Preparation

16. Turn signal switch assembly (12).
 - Let switch hang freely if removal is not needed.
 - To remove switch (12):
 - A. Turn signal switch connector from vehicle wire harness.
 - B. Wiring protector (26).
 - C. Gently pull wire harness through column.

3F5A-6 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

Figure 7 - Removing Turn Signal Switch

NOTICE: Coil assembly (3) will become uncentered if:

- 1) Steering column is separated from steering gear and is allowed to rotate, or
- 2) Centering spring is pushed down, letting hub rotate while coil (3) is removed from steering column. (If this occurs, see Figure 12)

Figure 8 - Removing Coil Assembly Switch

17. Inflatable restraint coil assembly (3) with wire harness from column assembly.
 - A. Wiring protector (26).
 - B. Attach a length of mechanics wire to terminal connector harness to aid in reassembly.
 - C. Gently pull wire through column.

18. Key from steering column pass key lock cylinder set (20).
19. Buzzer switch assembly (16).
20. Reinsert key in pass key lock cylinder (20).
 - Key in "LOCK" position.
21. Lock retaining screw (18).
22. Pass key lock cylinder (20) and harness.
 - To remove lock cylinder.
 - A. Cylinder harness connector from vehicle wire harness.
 - B. Wiring protector (26).
 - C. Attach a length of mechanics wire to terminals to aid in reassembly.
 - D. Gently pull wire harness through column.

Install or Connect

Figures 1,2,9 through 14,25

NOTICE: See "Notice" on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

NOTICE: Route wire from pass key lock cylinder as shown and snap retaining clip into hole lock in housing cover assembly (19). (See Figures 9 and 10) Failure to do so may result in component damage or malfunction of pass key lock cylinder (20).

Figure 9 - Installing Pass Key Lock Cylinder Set

Figure 10 - Routing Pass Key Wire Harness

1. Steering column pass key lock cylinder set (20).
 - A. Wire terminals through column and snap retaining clip into hole in lock housing cover assembly (19).
 - B. Cylinder harness connector to vehicle wire harness.

2. Lock retaining screw (18).

Tighten

- Tighten screw (18) to 2.5 N·m (22 lb.in.).

3. Key from pass key lock cylinder set (20).
4. Buzzer switch assembly (16).
5. Reinsert key in pass key lock cylinder set (20).
 - Key in "LOCK" position.
6. Turn signal switch assembly (12) wire harness through steering column.
 - Let switch hang freely.
 - Switch connector to vehicle wire harness.

Figure 11 - Wire Harnesses through Column

7. Coil assembly (3) wire harness through column. (See Figure 13)
 - Let coil hang freely.
8. Turn signal switch assembly (12) and binding head cross recess screws (9).

Tighten

- Tighten screws (9) to 3.4 N·m (30 lb.in.).

9. Signal switch arm (11), flat head screw (10) and cross recess tapping screw (27).

Tighten

- Tighten screw (10) and screw (27) to 2.3 N·m (20 lb.in.).

10. Hazard knob assembly and multi-function lever. (See Section 3F)
11. Inner race (14).
12. Upper bearing inner race seat (13).
13. Upper bearing spring (8).
14. Turn signal cancelling cam assembly (7).
 - Lubricate with grease, synthetic (service kit).
15. Shaft lock (6).
16. New shaft lock retaining ring (5) using J 23653-SIR to push down shaft lock (6).
 - Ring (5) must be firmly seated in groove on shaft.

NOTICE: Set steering shaft so that block tooth on upper steering shaft (56) is at the 12 o'clock position, wheels on vehicle should be straight ahead, then set ignition switch to "LOCK" position, to ensure no damage to coil assembly (3). (Refer to Figure 25)

17. Wave washer (4).

NOTICE: Coil assembly (3) will become uncentered if:

- 1) Steering column is separated from steering gear and is allowed to rotate, or
- 2) Centering spring is pushed down, letting hub rotate while coil is removed from column. (If this occurs, see Figure 12)

3F5A-8 TILT STRG COL UNIT REPAIR (SIR, COL SHFT)

Figure 12 - Centering Coil Assembly

NOTICE: If a new coil assembly (3) is being installed, assemble pre-centered coil assembly (3) to steering column. Remove centering tab and dispose. (See Figure 12)

Figure 13 - Routing Coil Assembly Wire

NOTICE: SIR coil assembly wire must be kept tight with no slack while installing SIR coil assembly. Failure to do so may cause wire to be kinked near shaft lock area and cut when steering wheel is turned.

18. Ensure coil assembly (3) hub is centered.
19. Coil assembly (3).
 - Pull wire tight while positioning SIR coil to steering shaft. (See Figure 13)
 - Align opening in coil with horn tower and "Locating bump" between two tabs on housing cover. (See Figure 14)
 - Seat coil assembly into steering column.

Figure 14 - Coil Assembly Installed

20. Coil assembly retaining ring (2).
 - Ring (2) must be firmly seated in groove on shaft.

NOTICE: Gently pull lower coil assembly, turn signal, and pass key wires to remove any wire kinks that may be inside steering column assembly. Failure to do so may cause damage to wire harness.

21. Wiring protector (26).
22. Refer to Section 3F to complete remaining steering column assembly.
23. Negative (-) battery cable.
24. If all service operations are completed, enable the SIR system; refer to "Enabling SIR System" in this Section.

SUB SECTION B - HOUSING COVER

Figures 1,2,15 through 19

INCLUDES:

**COL HSG COVER END CAP
LOCK HOUSING COVER ASSEMBLY
PIVOT & (PULSE) SWITCH ASSEMBLY
DIMMER SWITCH ROD ACTUATOR
TILT SPRING ASSEMBLY**

Tools Required:

J 23653-SIR Lock Plate Compressor

Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

Important

- Remove only those components necessary to do repairs.

Remove or Disconnect

- Do all steps, "Remove or Disconnect", Sub Section A.
- Column housing cover end cap (25).

Figure 15 - Cruise Control Equipped Steering Columns

Important

- Remove cruise control and multi-function lever connectors from base plate (24) and disconnect.
- Remove multi-function lever. (See Section 3F)

Figure 16 - Lock Housing Cover Screw Positions

Figure 17 - Removing Lock Housing Cover

- Cover screws (15).
- Tilt lever. (See Section 3F)
- Lock housing cover assembly (19).
- Column housing cover end base plate (24) and dimmer switch rod actuator (21).
- Wire protector shield (36).

Figure 18 - Removing Pivot & (Pulse) Switch

8. Switch actuator pivot pin (22).
9. Pivot & (pulse) switch assembly (23).
 - Let switch hang freely if removal is not needed.
 - To remove switch (23):
 - A. Pivot & (pulse) switch connector from vehicle wire harness.
 - B. Gently pull wire harness through column.

Figure 19 - Removing Tilt Spring Assembly

10. Seat counterbore of tool J 39246 over end of race & upper shaft assembly (56).
11. Thread and seat standard hexagon nut on shaft (56) to secure tool.
12. Align square extension on end of tool bolt with square hole in spring retainer (52) and seat.

13. Rotate tool bolt clockwise with wrench until it contacts surface of tool block.

Inspect

- Spring retainer (52) must be compressed approximately 1/4-inch into steering column housing (46).

Important

- Square hole in spring retainer (52) may become striped. Ensure spring retainer (52) is compressed at least 1/4-inch and is turned no more than 1/4 turn.

14. Rotate hexagon section on end of tool bolt counter clockwise approximately 1/4 turn.
15. Unscrew tool bolt until wheel tilt spring (51) and retainer (52) are loose and free of tool.
16. Remove retainer (52), spring (51), spring guide (50), and tool J 39246.

Install or Connect

NOTICE: See "Notice" on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

NOTICE: If new wheel tilt spring (51) is to installed, grease spring (51) and spring guide (50).

1. Install spring (51), spring guide (50), and spring retainer (52) to steering column housing (46).
2. Align securing tabs on spring retainer (52) with slots in tilt spring hole.
3. Tool J 39246 to steering shaft (56) and retainer (52).
 - Do steps 10 through 13, **Inspect**, and **Important** to setup tool and compress spring (51).
4. Rotate hexagon section on end of tool bolt clockwise approximately 1/4 turn to lock retainer (52) into place.
5. Unscrew tool bolt and remove from shaft (56).
 - Spring (51) and retainer (52) must be locked into position in housing (46).

 Inspect

- Tilt housing (46) to all positions to ensure smooth and proper operation of tilt spring.
6. Pivot & (pulse) switch assembly (23) to lock housing cover assembly (19).
 7. Switch actuator pivot pin (22) to switch (23) and cover (19).
 8. Pivot & (pulse) switch wire harness through steering column.
 - Switch connector to vehicle wire harness.
 - Wire protector shield (36).
 9. Dimmer switch rod actuator (21) to base plate (24).
 - Lubricate with lithium grease.
 10. Base plate (24) to lock housing cover assembly (19).
 - Bottom edge of dimmer switch rod actuator (21) must rest on bend in dimmer switch rod (76).
 11. Lock housing cover assembly (19).
 12. Screws (15). Tighten screw in 12 o'clock position first, screw in 8 o'clock position second, and screw in 3 o'clock position third.

 Tighten

- Tighten screws (15) in same order to 9.0 N·m (80 lb.in.).
13. Install multi-function lever and tilt lever. (See Section 3F)
 14. Plug multi-function lever and cruise control connectors together and mount on base plate (24).
 15. Column housing cover end cap (25).
 16. Do all steps, "Install or Connect", Sub Section A.

SUB SECTION C - MID COLUMN**INCLUDES:**

**STEERING COLUMN HOUSING ASM
STEERING WHEEL LOCK SHOE
SWITCH ACTUATOR SECTOR
SWITCH ACTUATOR RACK
BEARING ASSEMBLY
LOCK BOLT
STEERING COL HSG SUPPORT ASM
STEERING SHAFT ASSEMBLY
SHIFT TUBE ASSEMBLY**

Tools Required:

J 23653-SIR Lock Plate Compressor
J 21854-01 Pivot Pin Remover
J 22635 Lock Shoe and Release Lever Pin
Remover and Installer
J 8092 Driver Handle
J 38639 Strg Col Housing Bearing Installer
J 23072 Shift Tube Remover
J 23073-01 Shift Tube Installer

 Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

 Remove or Disconnect

Figures 1,2,20 through 29,34 and 39

1. Disable the SIR system; refer to "Disabling the SIR System" in this section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)

NOTICE: Once steering column is removed from vehicle, the column is extremely susceptible to damage. Dropping steering column assembly on its end could collapse steering shaft or loosen plastic injections which maintain column rigidity. Leaning on steering column assembly could cause jacket to bend or deform. Any of the above damage could impair steering column's collapsible design. If it is necessary to remove steering wheel, use only the specified steering wheel puller. Under no conditions should the end of shaft be hammered on as hammering could loosen plastic injections which maintain steering column rigidity.

3F5A-12 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

Inspect

- Steering column for accident damage. (See Figure 39)
- Do all steps, "Remove or Disconnect", Sub Section B.

Figure 20 - Removing Pivot Pin

- Pivot pins (39) using J 21854-01.
 - Reinstall tilt lever. (See Section 3F)
- Steering column housing assembly (30).
 - Pull back on tilt lever and pull steering column housing assembly (30) down and away from column.

Important

- Remove only those components necessary to do repairs.

Figure 21 - Lock Housing Cover Components, Exterior

Figure 22 - Lock Housing Cover Components, Interior

Disassemble

Steering Column Housing Assembly

- Bearing assembly (31).
- Hexagon head screw (48).
- Lock bolt spring (33).
- Lock bolt (32).
- Switch actuator rack (44) and rack preload spring (45).
- Drive shaft (37).
- Switch actuator sector (47).
- Release lever pin (42) using J 22635.
- Shoe release lever (43).
- Release lever spring (41).
- Dowel pin (38) using J 22635.
- Lock shoes (34) and (35).
- Shoe springs (40).

Assemble

Steering Column Housing Assembly

- Shoe springs (40).
- Lock shoes (34) and (35).
- Dowel pin (38) using J 22635.
- Release lever spring (41).

- E. Shoe release lever (43).
- F. Release lever pin (42) using J 22635.
- G. Switch actuator sector (47).
- H. Drive shaft (37).
- I. Rack preload spring (45).
- J. Switch actuator rack (44) to actuator sector (47).
- K. Bearing assembly (31) lubricated with lithium grease to column housing (46) using J 38639 and J 8092.
- L. Lock bolt (32).
- M. Lock bolt spring (33). (Refer to Figure 34)
- N. Hexagon head screw (48).

Tighten

- Tighten screw (48) to 4.0 N·m (35 lb.in.).

Figure 23 - Installing Bearings

- 7. Lower bearing adapter clip (91).
- 8. Bearing adapter retainer (89).
- 9. Steering shaft bushing assembly (88).
- 10. Steering shaft assembly (55).

Inspect

- Steering shaft assembly (55) for accident damage. (See Figure 39)

Important

- Mark race & upper shaft assembly (56) and lower steering shaft asm (59) to ensure proper assembly. Failure to assemble properly will cause steering wheel to be turned 180 degrees. (See Figures 24 and 25)

Figure 24 - Removing Steering Shaft Components

Important

- Remove only those components necessary to do repairs.

Disassemble

Steering Shaft Assembly

- A. Race & upper shaft assembly (56), lower steering shaft assembly (59).
 - Tilt 90 degrees to each other and disengage.
- B. Centering sphere (57) from upper shaft assembly (56).
 - Rotate sphere 90 degrees and slip out.
- C. Joint preload spring (58) from centering sphere (57).

3F5A-14 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

Figure 25 - Correct Upper to Lower Shaft Orientation

Assemble

Steering Shaft Assembly

- A. Joint preload spring (58) to two centering sphere (57).
- B. Centering sphere (57).
 - Lubricate with lithium grease, slip into upper shaft assembly (56), and rotate sphere 90 degrees.
- C. Race & upper shaft assembly (56) to lower steering shaft assembly (59).
 - Line up marks and tilt assemblies 90 degrees to each other.

Figure 26 - Removing Column Housing Support

11. Support screws (61).
 - Dispose of screws (61).
12. Column housing support assembly (62) with dimmer switch rod (76) from steering column jacket assembly (73).
 - Rod (76) from support (63).
13. Oval head cross recess screws (64) and shift lever gate (65) from support (63).
14. Shift tube retaining ring (66).
15. Thrust washer (67).

Figure 27 - Shift Tube Lever Position

NOTICE: Shift tube lever must be in position to clear jacket assembly (73) when removing shift tube (87). Forcing lever against jacket may cause damage to jacket assembly (73). (See Figure 27)

16. Shift tube (87) using J 23072.
17. Lock plate (68).
18. Wave washer (69).
19. Gearshift lever bowl assembly (71) with gearshift bowl shroud (72).
20. Shift lever spring (70) from bowl (71).
21. Shroud (72) from bowl (71).

Figure 28 - Removing Shift Tube

! Important

- Solenoid cable must remain straight and must not be kinked during removing and installing.
22. Solenoid cable assembly from interlock solenoid assembly (83).
 - A. Cable mounting clip from solenoid bracket (82).
 - B. Ball joint socket from solenoid (83).
 - C. Ball joint spring (85).
 23. Hexagon washer head screw (84).
 - Solenoid assembly (83).
 24. Hexagon head tapping screw (77) and hexagon nut (78).
 - Solenoid bracket (82).

Figure 29 - Removing Ignition, Dimmer Switches, and Solenoid Assembly

25. Washer head screw (75).
 - Dimmer switch assembly (81).
26. Dimmer & ignition switch mounting stud (80).

27. Ignition switch assembly (79) from ignition switch actuator assembly (86).
28. Cable assembly with ignition switch actuator assembly (86).
 - Cable clip from upper location of steering column jacket assembly (73).
 - Cable retainer (74).

↔ Install or Connect

Figures 1,2,27,30 through 37

NOTICE: See "Notice" on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Cable assembly with ignition switch actuator assembly (86).
 - A. Cable retainer (74).
 - B. Cable clip to upper location of jacket assembly (73).
 - C. Lubricate with grease at location where cable lug attaches to switch actuator.
 - D. Let lower cable hang freely.
2. Bowl (71) to shroud (72).
3. Spring (70) to bowl (71).
4. Shroud (72) with bowl (71) to jacket (73).
5. Wave washer (69).
 - Lubricate with lithium grease.
6. Lock plate (68).

Figure 30 - Installing Lock Plate, Wave Washer

3F5A-16 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

NOTICE: Shift tube lever must be in position to clear jacket assembly (73) when installing shift tube (87). Forcing lever against jacket may cause damage to jacket assembly (73). (See Figure 27)

Figure 31 - Installing Shift Tube

7. Shift tube (87) using J 23073-01.
8. Thrust washer (67).
9. Retaining ring (66).

Figure 32 - Installing Shift Tube Retaining Ring, Thrust Washer

10. Shift lever gate (65) and screws (64) to support (63).

Tighten

- Tighten screws (64) to 3.7 N·m (33 lb.in.).

11. Dimmer switch rod (76) to column housing support assembly (62).

NOTICE: Support screws (61) require thread locking compound. New screws must be used when reassembling steering column housing support assembly (62).

12. Support assembly (62) with new support screws (61).

Tighten

- Tighten screws (61) to 8.8 N·m (78 lb.in.).

13. Column shaft assembly (55) to jacket assembly (73).
 - Lubricate with lithium grease.
14. Tilt lever. (See Section 3F)
15. Steering column housing assembly (30) to column.
 - A. Position column housing (30) and align switch actuator rack (44) with pin on end of ignition switch actuator assembly (86).
 - B. Pull back on tilt lever, pushing column housing assembly (30) onto column housing support assembly (62).
 - C. Release tilt lever to lock shoes (34) and (35) onto dowel pins.
 - D. Remove tilt lever. (See Section 3F)

16. Pivot pins (39).
 - Lubricate with lithium grease.
 - Press pin until firmly seated, two places.
 - Stake, three places.

Figure 33 - Installing Column Housing to Housing Support

Figure 34 - Actuator Assembly to Actuator Rack Installed

17. Steering shaft bushing assembly (88) to jacket assembly (73).
 - Lubricate inner surface of bushing (88) with lithium grease.
18. Bearing adapter retainer (89).
19. Lower bearing adapter clip (91).
20. Do steps 1 through 15, "Install or Connect", Sub Section B.
21. Do steps 1 through 21, "Install or Connect", Sub Section A.
22. Do all steps, "Install or Connect", **Ignition Switch Assembly**, Sub Section D.

SUB SECTION D - LOWER COLUMN

INCLUDES:

INTERLOCK SOLENOID ASSEMBLY
 INTERLOCK SOLENOID ADJUSTMENT
 DIMMER SWITCH ASSEMBLY
 DIMMER SWITCH ADJUSTMENT
 IGNITION SWITCH ASSEMBLY
 IGNITION SWITCH ADJUSTMENT
 STEERING SHAFT BUSHING ASM

NOTICE: Once steering column is removed from vehicle, the column is extremely susceptible to damage. Dropping steering column assembly on its end could collapse steering shaft or loosen plastic injections which maintain column rigidity. Leaning on steering column assembly could cause jacket to bend or deform. Any of the above damage could impair steering column's collapsible design. If it is necessary to remove steering wheel, use only the specified steering wheel puller. Under no conditions should the end of shaft be hammered on as hammering could loosen plastic injections which maintain steering column rigidity.

- Steering column for accident damage. (See Figure 39)

Interlock Solenoid Assembly

Figures 1,2,29 and 35

Remove or Disconnect

1. Disable the SIR system; refer to "**Disabling the SIR System**" in this Section.
2. Negative (-) battery cable.
3. Vehicle wire harness connector from interlock solenoid assembly (83).

Important

- Solenoid cable must remain straight and must not be kinked during removing and installing.

3F5A-18 TILT STRG COL UNIT REPAIR (SIR, COL SHFT)

4. Solenoid cable assembly from interlock solenoid assembly (83).
 - A. Mounting clip from solenoid bracket (82).
 - B. Ball joint socket from solenoid (83).
 - C. Ball joint spring (85) from solenoid (83).
5. Washer head screw (84) and solenoid assembly (83).

Install or Connect

NOTICE: See “Notice” on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying required torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Interlock solenoid assembly (83) to solenoid bracket (82).
2. Washer head screw (84).

Tighten

- Tighten screw (84) to 4.0 N·m (35 lb.in.)
3. Unlock solenoid cable.
 - Disengage locking button to allow cable movement during adjustment.
 4. Cable assembly to solenoid bracket (82) with locking button disengaged.
 5. Ball joint spring (85) and ball joint socket to solenoid (83).

Figure 35 - Interlock Solenoid Adjustment

Adjust

- Interlock solenoid assembly (83).
 - A. Lock cylinder to “Run” position.
 - B. Shift column out “Park” position.
 - C. The locking button must be disengaged to allow cable movement. Pull cable away from solenoid (83) until cable fitting starts to extend, compressing spring inside joint socket. (Do not extend cable fitting)
 - Let cable move back 1.0 to 2.0 mm.
 - Engage locking button.

6. Vehicle wire harness connector to solenoid assembly (83).
7. Negative (-) battery cable.

IMPORTANT: During **Inspection** and **Adjustment** of interlock & solenoid assembly, solenoid will become hot.

Inspect

- Function check interlock solenoid assembly (83) for proper operation.
 - Solenoid (83) must lock gearshift lever bowl assembly (71) whenever steering column is in “PARK” and when trying to shift from “PARK” without pressing brake pedal (Solenoid is energized).
 - Solenoid (83) must release gearshift lever bowl assembly (71) when pressure is applied to brake pedal. (Solenoid is de-energized).
 - Readjust if needed.
8. If all service operations are completed, enable the SIR system; refer to “Enabling the SIR System” in this Section.

Dimmer Switch Assembly Dimmer Switch Adjustment

Remove or Disconnect

Figures 1,2 and 29

1. Disable the SIR system; refer to **“Disabling the SIR System”** in this Section.
2. Negative (-) battery cable.
3. Hexagon head tapping screw (77) and hexagon nut (78).
4. Interlock solenoid assembly (83) with solenoid bracket (82) from dimmer & ignition switch mounting stud (80).
5. Vehicle wire harness from dimmer switch (81).
6. Washer head screw (75).
7. Dimmer Switch assembly (81) from dimmer switch rod (76).

Install or Connect

Figures 1,2,29,35 and 36

NOTICE: See “Notice” on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying required torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Dimmer Switch assembly (81) to dimmer switch rod (76) and stud (80).
2. Solenoid (83) with bracket (82).
3. Tapping screw (77) hexagon nut (78) and washer head screw (75).
 - Tighten finger tight.

Figure 36 - Adjusting Dimmer Switch

Adjust

- Dimmer switch (81). (See Figure 36)
 - A. Place 3/32-inch drill bit in hole on switch to limit travel.
 - B. Position switch on column and push against dimmer switch rod (76) to remove all lash.
 - C. Remove drill bit.

Tighten

- Tighten screw (75) and nut (78) to 4.0 N·m (35 lb.in.)
 - Tighten screw (77) to 2.5 N·m (22 lb.in.)
4. Vehicle wire harness to dimmer switch (81).
 5. Negative (-) battery cable.
 6. Do **Inspect**, “Install or Connect”, **Interlock Solenoid Assembly**, in this section.
 7. If all service operations are completed, enable the SIR system; refer to **“Enabling the SIR System”** in this Section.

Ignition Switch Assembly Ignition Switch Adjustment

Remove or Disconnect

Figures 1,2 and 29

1. Disable the SIR system; refer to **“Disabling the SIR System”** in this Section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)
4. Solenoid cable assembly from interlock solenoid assembly (83) and solenoid bracket (82).
 - Ball joint spring (85).
5. Washer head screw (84).
 - Interlock solenoid assembly (83).

3F5A-20 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

6. Hexagon head tapping screw (77) and hexagon nut (78).
 - Solenoid bracket (82).
7. Washer head screw (75).
 - Dimmer switch assembly (81).
8. Dimmer & ignition switch mounting stud (80).
 - Ignition switch assembly (79).
 - Ignition switch (79) from vehicle wire harness.

Install or Connect Figures 1,2,29,35 through 37

NOTICE: See “Notice” on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying required torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Lock cylinder (20) to “OFF-LOCK” position.

NOTICE: Install ignition switch assembly (79) with switch in “OFF-LOCK” position. (See Figure 37) New ignition switch will be pinned in “OFF-LOCK” position. Remove plastic pin after switch is assembled to column. Failure to do so may cause switch damage.

Figure 37 - Adjusting Ignition Switch

Adjust

- Ignition switch assembly (79). (See Figure 37)
 - A. Move switch slider to extreme right position.
 - B. Move switch slider one detent to left “OFF-LOCK” position.
 - C. Install 3/32 inch drill bit in hole on switch to limit travel.
- 2. Ignition switch assembly (79) to ignition switch actuator assembly (86).
- 3. Dimmer & ignition switch mounting stud (80).

Tighten

- Tighten stud (80) to 4.0 N·m (35 lb.in.)
- 4. Remove drill bit from ignition switch (79).
- 5. Dimmer switch assembly (81) to dimmer switch rod (76) and stud (80).
- 6. Washer head screw (75).
 - Tighten finger tight.
- 7. Solenoid bracket (82) to stud (80).
- 8. Hexagon nut (78) and hexagon head tapping screw (77).
 - Tighten finger tight.

Adjust

- Dimmer switch (81). (See Figure 36)
 - A. Place 3/32-inch drill bit in hole on switch to limit travel.
 - B. Position Switch (81) on column and push to remove all lash.
 - C. Remove drill bit.

Tighten

- Tighten screw (75) and nut (78) to 4.0 N·m (35 lb.in.).
- Tighten screw (77) to 2.5 N·m (22 lb.in.).
- 9. Interlock solenoid assembly (83) to bracket (82).

10. Washer head screw (84).

Tighten

- Tighten screw (84) to 4.0 N·m (35 lb.in.).
11. Steering column to vehicle. (See Section 3F)
 12. Vehicle wire harness to ignition switch (79), dimmer switch (81), and solenoid assembly (83).
 13. Negative (-) battery cable.
 14. Do **Adjust** and **Inspect**, "Install or Connect", **Interlock Solenoid Assembly**, in this section.
 15. If all service operations are completed, enable the SIR system; refer to "**Enabling the SIR System**" in this Section.

Steering Shaft Bushing Asm

Remove or Disconnect Figures 1,2,38 and 39

1. Disable the SIR system; refer to "**Disabling the SIR System**" in this Section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)
4. Lower bearing adapter clip (91).
5. Bearing adapter retainer (89).
6. Steering shaft bushing assembly (88).

Install or Connect Figures 1,2 and 38

NOTICE: See "Notice" on page 3F5A-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Steering shaft bushing assembly (88) to jacket assembly (73).
 - Lubricate inner surface of bushing (88) with lithium grease.
2. Bearing adapter retainer (89).
3. Lower bearing adapter clip (91).
4. Steering column to vehicle. (See Section 3F)
5. Negative (-) battery cable.
6. If all service operations are completed, enable the SIR system; refer to "**Enabling the SIR System**" in this Section.

3F5A-22 TILT STRG COL UNIT REPAIR (SIR,COL SHFT)

CHECKING STEERING COLUMN FOR ACCIDENT DAMAGE

NOTICE: Vehicles involved in accidents resulting in frame damage, major body or sheet metal damage, or where the steering column has been impacted, or where supplemental inflatable restraints systems deployed may also have a damaged or misaligned steering column.

CHECKING PROCEDURE

JACKET ASM, STEERING COLUMN

- Check capsules on steering column bracket assembly; all should be within 1.59mm from the bottom of the slots (View A). If not, bracket should be replaced if bracket is bolted to the jacket asm or the jacket asm should be replaced if bracket is welded to jacket asm.
- Check contact surface "A" on capsules (View B). The bolt head must not contact surface "A" or shear load would be increased. If contact is made, replace bracket asm or jacket asm.
- Check for jacket asm collapse by measuring the distance from the lower edge of upper jacket to a defined point on the lower jacket (View E). If measured dimensions are not within specifications, a new jacket must be installed.

SHIFT TUBE ASM

- Visually inspect shift tube for sheared injected plastic (View C). If shift tube shows sheared plastic, a new shift tube must be installed.
- Check operation of shift lever. If you can move lever to "Park" position without raising lever, it is an indication that upper shift tube plastic bearing is broken.

NOTICE: Inflatable restraint coil asm must be removed from steering column and allowed to hang freely before shaft is rotated. Failure to do so could damage coil assembly.

STEERING SHAFT ASM

- Visually inspect steering shaft for sheared injected plastic (View D). If steering shaft shows sheared plastic, a new steering shaft must be installed.
- Any frame damage that could cause a bent steering shaft must have steering shaft runout checked in the following manner: Using a dial indicator at lower end of steering shaft, have steering wheel rotated. Runout must not exceed 1.59mm.

VIEW A

(CAPSULES)

VIEW B

CAPSULES MUST BE WITHIN 1.59 MM FROM BOTTOM OF SLOTS; IF NOT, REPLACE BRACKET OR JACKET.

THE BOLT HEAD MUST NOT CONTACT SURFACE "A". IF CONTACT IS MADE, THE CAPSULE SHEAR LOAD WILL BE INCREASED. REPLACE BRACKET OR JACKET.

CHECK FOR SHEARED INJECTED PLASTIC AT THESE LOCATIONS.

VIEW C
(SHIFT TUBE)

CHECK FOR SHEARED INJECTED PLASTIC AT THESE LOCATIONS.

VIEW D
(STEERING SHAFT)

VIEW E

SECTION 3F5B

SUPPLEMENTAL INFLATABLE RESTRAINT TILT STEERING COLUMN FLOOR SHIFT UNIT REPAIR

CAUTION: The procedures in this section must be followed in the order listed to temporarily disable the Supplemental Inflatable Restraint (SIR) System and prevent false diagnostic codes from setting. Failure to follow procedures could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Before removing or installing any electrical unit or when a tool or equipment could easily come in contact with "live" exposed electrical terminals, disconnect the negative battery cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the "off" or "lock" position.

NOTICE: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

SERVICE PRECAUTIONS

CAUTION: When performing service on or around SIR components or SIR wiring, follow the procedures listed below to temporarily disable the SIR system. Failure to follow procedures could result in possible air bag deployment, personal injury or unneeded SIR repairs.

The SDM can maintain sufficient voltage to cause a deployment for up to 10 seconds after the ignition switch is turned "OFF" or the battery is disconnected. Many of the service procedures require disconnection of the "AIR BAG" fuse and the inflator module circuits from the deployment loops to avoid an accidental deployment.

Disabling The SIR System

Remove or Disconnect

- Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
 - Turn ignition switch to "LOCK" and remove key
1. "AIR BAG" fuse from I/P fuse block.
 2. Left-hand sound insulator assembly, refer to SECTION 8C.
 3. Both connector position assurance (CPA) retainers and yellow 2-way SIR connectors located near base of the steering column.

Important

- With the "AIR BAG" fuse removed and ignition switch "ON", the "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SIR system malfunction.

Enabling The SIR System

Install or Connect

- Turn ignition switch to "LOCK" and remove key.
1. Both yellow 2-way SIR connectors and corresponding (CPA) retainers located near base of steering column.
 2. Left-hand sound insulator assembly, refer to SECTION 8C.
 3. "AIR BAG" fuse to I/P block.
 - Turn ignition switch to "RUN" and verify that the "AIR BAG" warning lamp flashes 7 times and then turns "OFF". If it does not operate as described, perform the "SIR Diagnostic System Check" in SECTION 9J-A.

Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

Remove or Disconnect *Figures 1 through 8 and 12*

NOTICE: Place ignition to "LOCK" position to prevent uncentering SIR coil assembly (3).

1. Disable the SIR system; refer to "Disabling the SIR System" in this Section.
2. Negative (-) battery cable.

Figure 3 - Removing Coil Assembly Off Shaft

3. Coil assembly retaining ring (2).
4. Inflatable restraint coil assembly (3).
 - Let switch hang freely if removal is not needed.
 - To remove coil assembly (3), do steps (5) through (17) in this section.
5. Wave washer (4).
6. Shaft lock retaining ring (5) using J 23653-SIR to push down shaft lock (6).
 - Dispose of ring (5).
7. Shaft lock (6).
8. Turn signal cancelling cam assembly (7).
9. Upper bearing spring (8).

Figure 4 - Removing Shaft Lock Retaining Ring

Figure 5 - Removing Components from Upper Shaft

10. Upper bearing inner race seat (13).
11. Inner race (14).
12. Turn signal to "RIGHT TURN" position (up).
13. Multifunction lever and hazard knob assembly. (See Section 3F)
14. Round washer head screw (M42x1.41) (10), and turn signal switch arm asm(11).
15. Turn signal switch screws (9).

Figure 6 - Turn Signal Switch Removal Preparation

16. Turn signal switch assembly (12).
 - Let switch hang freely if removal is not needed.
 - To remove switch (12):
 - A. Turn signal switch connector from vehicle wire harness.
 - B. Wiring protector (26).
 - C. Gently pull wire harness through column.

Figure 7 - Removing Turn Signal Switch

NOTICE: Coil assembly (3) will become uncentered if:

- 1) Steering column is separated from steering gear and is allowed to rotate, or
- 2) Centering spring is pushed down, letting hub rotate while coil (3) is removed from steering column. (If this occurs, see Figure 12)

Figure 8 - Removing Coil Assembly Switch

17. Inflatable restraint coil assembly (3) with wire harness from column assembly.
 - A. Wiring protector (26).
 - B. Attach a length of mechanics wire to terminal connector harness to aid in reassembly.
 - C. Gently pull wire through column.

18. Key from steering column pass key lock cylinder set (20).
19. Buzzer switch assembly (16).
20. Reinsert key in pass key lock cylinder (20).
 - Key in "LOCK" position.
21. Lock retaining screw (18).
22. Pass key lock cylinder (20) and harness.
 - To remove lock cylinder.
 - A. Cylinder harness connector from vehicle wire harness.
 - B. Wiring protector (26).
 - C. Attach a length of mechanics wire to terminals to aid in reassembly.
 - D. Gently pull wire harness through column.

Install or Connect

Figures 1,2,9 through 14,25

NOTICE: See "Notice" on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

NOTICE: Route wire from pass key lock cylinder as shown and snap retaining clip into hole lock in housing cover assembly (19). (See Figures 9 and 10) Failure to do so may result in component damage or malfunction of pass key lock cylinder (20).

Figure 9 - Installing Pass Key Lock Cylinder Set

Figure 10 - Routing Pass Key Wire Harness

1. Steering column pass key lock cylinder set (20).
 - A. Wire terminals through column and snap retaining clip into hole in lock housing cover assembly (19).
 - B. Cylinder harness connector to vehicle wire harness.

2. Lock retaining screw (18).

Tighten

- Tighten screw (18) to 2.5 N·m (22 lb.in.).
3. Key from pass key lock cylinder set (20).
 4. Buzzer switch assembly (16).
 5. Reinsert key in pass key lock cylinder set (20).
 - Key in "LOCK" position.
 6. Turn signal switch assembly (12) wire harness through steering column.
 - Let switch hang freely.
 - Switch connector to vehicle wire harness.

Figure 11 - Wire Harnesses through Column

7. Coil assembly (3) wire harness through column. (See Figure 13)
 - Let coil hang freely.
8. Turn signal switch assembly (12) and binding head cross recess screws (9).

Tighten

- Tighten screws (9) to 3.4 N·m (30 lb.in.).
9. Signal switch arm (11), Round washer head screw (10).

Tighten

- Tighten screw (10) to 2.3 N·m (20 lb.in.).
10. Hazard knob assembly and multifunction lever. (See Section 3F)
 11. Inner race (14).
 12. Upper bearing inner race seat (13).
 13. Upper bearing spring (8).
 14. Turn signal cancelling cam assembly (7).
 - Lubricate with grease, synthetic.
 15. Shaft lock (6).
 16. New shaft lock retaining ring (5) using J 23653-SIR to push down shaft lock (6).
 - Ring (5) must be firmly seated in groove on shaft.

NOTICE: Set steering shaft so that block tooth on upper steering shaft (56) is at the 12 o'clock position, wheels on vehicle should be straight ahead, then set ignition switch to "LOCK" position, to ensure no damage to coil assembly (3). (Refer to Figure 25)

17. Wave washer (4).

NOTICE: Coil assembly (3) will become uncentered if:

- 1) Steering column is separated from steering gear and is allowed to rotate, or
- 2) Centering spring is pushed down, letting hub rotate while coil is removed from column. (If this occurs, see Figure 12)

3F5B - 8 TILT STRG COL UNIT REP AIR (SIR, FLR SHFT)

Figure 12 - Centering Coil Assembly

NOTICE: If a new coil assembly (3) is being installed, assemble pre-centered coil assembly (3) to steering column. Remove centering tab and dispose. (See Figure 12)

Figure 13 - Routing Coil Assembly Wire

NOTICE: SIR coil assembly wire must be kept tight with no slack while installing SIR coil assembly. Failure to do so may cause wire to be kinked near shaft lock area and cut when steering wheel is turned.

- Ensure coil assembly (3) hub is centered.
- Coil assembly (3).
 - Pull wire tight while positioning SIR coil to steering shaft. (See Figure 13)
 - Align opening in coil with horn tower and "Locating bump" between two tabs on housing cover. (See Figure 14)
 - Seat coil assembly into steering column.

Figure 14 - Coil Assembly Installed

- Coil assembly retaining ring (2).
 - Ring (2) must be firmly seated in groove on shaft.

NOTICE: Gently pull lower coil assembly, turn signal, and pass key wires to remove any wire kinks that may be inside steering column assembly. Failure to do so may cause damage to wire harness.

- Wiring protector (26).
- Refer to Section 3F to complete remaining steering column assembly.
- Negative (-) battery cable.
- If all service operations are completed, enable the SIR system; refer to "Enabling SIR System" in this Section.

SUB SECTION B - HOUSING COVER*Figures 1, 2, 15 through 19***INCLUDES:**

**COL HSG COVER END CAP
LOCK HOUSING COVER ASSEMBLY
PIVOT & (PULSE) SWITCH ASSEMBLY
DIMMER SWITCH ROD ACTUATOR
TILT SPRING ASSEMBLY**

Tools Required:

J 23653-SIR Lock Plate Compressor

Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

Important

- Remove only those components necessary to do repairs.

Remove or Disconnect

- Do all steps, "Remove or Disconnect", Sub Section A.
- Column housing cover end cap (25).

Figure 15 - Cruise Control Equipped Steering Columns

Important

- Remove cruise control and multifunction lever connectors from base plate (24) and disconnect.
- Remove multifunction lever. (See Section 3F)

Figure 16 - Lock Housing Cover Screw Positions

Figure 17 - Removing Lock Housing Cover

- Cover screws (15).
- Tilt lever. (See Section 3F)
- Lock housing cover assembly (19).
- Column housing cover end base plate (24) and dimmer switch rod actuator (21).
- Wire protector shield (36).

Figure 18 - Removing Pivot & (Pulse) Switch

8. Switch actuator pivot pin (22).
9. Pivot & (pulse) switch assembly (23).
 - Let switch hang freely if removal is not needed.
 - To remove switch (23):
 - A. Pivot & (pulse) switch connector from vehicle wire harness.
 - B. Gently pull wire harness through column.

Figure 19 - Removing Tilt Spring Assembly

10. Seat counterbore of tool J 39246 over end of race & upper shaft assembly (56).
11. Thread and seat standard hexagon nut on shaft (56) to secure tool.

12. Align square extension on end of tool bolt with square hole in spring retainer (52) and seat.
13. Rotate tool bolt clockwise with wrench until it contacts surface of tool block.

Inspect

- Spring retainer (52) must be compressed approximately 1/4-inch into steering column housing (46).

Important

- Square hole in spring retainer (52) may become striped. Ensure spring retainer (52) is compressed at least 1/4-inch and is turned no more than 1/4 turn.

14. Rotate hexagon section on end of tool bolt counter clockwise approximately 1/4 turn.
15. Unscrew tool bolt until wheel tilt spring (51) and retainer (52) are loose and free of tool.
16. Remove retainer (52), spring (51), spring guide (50), and tool J 39246.

Install or Connect

NOTICE: See "Notice" on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

NOTICE: If new wheel tilt spring (51) is to be installed, grease spring (51) and spring guide (50).

1. Install spring (51), spring guide (50), and spring retainer (52) to steering column housing (46).
2. Align securing tabs on spring retainer (52) with slots in tilt spring hole.
3. Tool J 39246 to steering shaft (56) and retainer (52).
 - Do steps 10 through 13, **Inspect**, and **Important** to setup tool and compress spring (51).
4. Rotate hexagon section on end of tool bolt clockwise approximately 1/4 turn to lock retainer (52) into place.

5. Unscrew tool bolt and remove from shaft (56).
 - Spring (51) and retainer (52) must be locked into position in housing (46).

Inspect

- Tilt housing (46) to all positions to ensure smooth and proper operation of tilt spring.
6. Pivot & (pulse)switch assembly (23) to lock housing cover assembly (19).
 7. Switch actuator pivot pin (22) to switch (23) and cover (19).
 8. Pivot & (pulse)switch wire harness through steering column.
 - Switch connector to vehicle wire harness.
 - Wire protector shield (36).
 9. Dimmer switch rod actuator (21) to base plate (24).
 - Lubricate with lithium grease.
 10. Base plate (24) to lock housing cover assembly (19).
 - Bottom edge of dimmer switch rod actuator (21) must rest on bend in dimmer switch rod (76).
 11. Lock housing cover assembly (19).
 12. Screws (15). Tighten screw in 12 o'clock position first, screw in 8 o'clock position second, and screw in 3 o'clock position third.

Tighten

- Tighten screws (15) in same order to 9.0 N·m (80 lb.in.).
13. Install multifunction lever and tilt lever. (See Section 3F)
 14. Plug multifunction lever and cruise control connectors together and mount on base plate (24).
 15. Column housing cover end cap (25).
 16. Do all steps, "Install or Connect", Sub Section A.

SUB SECTION C - MID COLUMN

INCLUDES:

STEERING COLUMN HOUSING ASM
STEERING WHEEL LOCK SHOE
SWITCH ACTUATOR SECTOR
SWITCH ACTUATOR RACK
BEARING ASSEMBLY
LOCK BOLT
STEERING COL HSG SUPPORT ASM
STEERING SHAFT ASSEMBLY

Tools Required:

J 23653-SIR Lock Plate Compressor
J 21854-01 Pivot Pin Remover
J 22635 Lock Shoe and Release Lever Pin Remover and Installer
J 8092 Driver Handle
J 38639 Strg Col Housing Bearing Installer

Important

- Before doing any service procedures in this section, disabling the SIR system and removal of Inflator Module and Steering Wheel is needed. (Refer to "Disabling the SIR System" in this section and service procedures in Section 3F)

Remove or Disconnect

Figures 1,2,20 through 29,34 and 39

1. Disable the SIR system; refer to "Disabling the SIR System" in this section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)

NOTICE: Once steering column is removed from vehicle, the column is extremely susceptible to damage. Dropping steering column assembly on its end could collapse steering shaft or loosen plastic injections which maintain column rigidity. Leaning on steering column assembly could cause jacket to bend or deform. Any of the above damage could impair steering column's collapsible design. If it is necessary to remove steering wheel, use only the specified steering wheel puller. Under no conditions should the end of shaft be hammered on as hammering could loosen plastic injections which maintain steering column rigidity.

Inspect

- Steering column for accident damage.
(See Figure (33))

- Do all steps, "Remove or Disconnect", Sub Section B.

Figure 20 - Removing Pivot Pin

- Pivot pins (39) using J 21854-01.
 - Reinstall tilt lever. (See Section 3F)
- Steering column housing assembly (30).
 - Pull back on tilt lever and pull steering column housing assembly (30) down and away from column.

Important

- Remove only those components necessary to do repairs.

Figure 21 - Lock Housing Cover Components, Exterior

Figure 22 - Lock Housing Cover Components, Interior

Disassemble

Steering Column Housing Assembly

- Bearing assembly (31).
- Hexagon head screw (48).
- Lock bolt spring (33).
- Lock bolt (32).
- Switch actuator rack (44) and rack preload spring (45).
- Drive shaft (37).
- Switch actuator sector (47).
- Release lever pin (42) using J 22635.
(See Figure 22)
- Shoe release lever (43).
- Release lever spring (41).
- Dowel pin (38) using J 22635.
(See Figure 21)
- Lock shoes (34) and (35).
- Shoe springs (40).

Assemble

Steering Column Housing Assembly

- Shoe springs (40).
- Lock shoes (34) and (35).

- C. Dowel pin (38) using J 22635.
- D. Release lever spring (41).
- E. Shoe release lever (43).
- F. Release lever pin (42) using J 22635.
- G. Switch actuator sector (47).
- H. Drive shaft (37).
- I. Rack preload spring (45).
- J. Switch actuator rack (44) to actuator sector (47).
- K. Bearing assembly (31) lubricated with lithium grease to column housing (46) using J 38639 and J 8092.
- L. Lock bolt (32).
- M. Lock bolt spring (33). (Refer to Figure 29)
- N. Hexagon head screw (48).

Tighten

- Tighten screw (48) to 4.0 N·m (35 lb.in.).

Figure 23 - Installing Bearings

- 7. Bearing adapter retainer (89).
- 8. Steering shaft bushing assembly (88).
- 9. Steering shaft assembly (55).

Inspect

- Steering shaft assembly (55) for accident damage. (See Figure 33)

Important

- Mark race & upper shaft assembly (56) and lower steering shaft asm (59) to ensure proper assembly. Failure to assemble properly will cause steering wheel to be turned 180 degrees. (See Figures 24 and 25)

Figure 24 - Removing Steering Shaft Components

Important

- Remove only those components necessary to do repairs.

Disassemble

Steering Shaft Assembly

- A. Race & upper shaft assembly (56), lower steering shaft assembly (59).
 - Tilt 90 degrees to each other and disengage.
- B. Centering sphere (57) from upper shaft assembly (56).
 - Rotate sphere 90 degrees and slip out.
- C. Joint preload spring (58) from centering sphere (57).

Figure 25 - Correct Upper to Lower Shaft Orientation

Assemble

Steering Shaft Assembly

- A. Joint preload spring (58) to two centering sphere (57).
- B. Centering sphere (57).
 - Lubricate with lithium grease, slip into upper shaft assembly (56), and rotate sphere 90 degrees.
- C. Race & upper shaft assembly (56) to lower steering shaft assembly (59).
 - Line up marks and tilt assemblies 90 degrees to each other.

Figure 26 - Removing Column Housing Support

15. Ignition switch assembly (79) from ignition switch actuator assembly (86).
16. Cable assembly with ignition switch actuator assembly (86).
 - Cable clip from upper location of steering column jacket assembly (73).

Install or Connect

Figures 1,2,28 through 31

NOTICE: See "Notice" on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Cable assembly with ignition switch actuator assembly (86).
 - A. Cable clip to upper location of jacket assembly (73).
 - B. Lubricate with grease at location where cable lug attaches to switch actuator.
 - C. Let lower cable hang freely.
2. Shroud (71) to jacket (73).

Tighten

- Tighten Hex washer head tapping screws (61) to 4.0 N·m (35 lb.in.).
3. Column shaft assembly (55) to jacket assembly (73).
 - Lubricate with lithium grease.
 4. Tilt lever. (See Section 3F)
 5. Steering column housing assembly (30) to column.
 - A. Position column housing (30) and align switch actuator rack (44) with pin on end of ignition switch actuator assembly (86).
 - B. Pull back on tilt lever, pushing column housing assembly (30) onto column housing support assembly (62).
 - C. Release tilt lever to lock shoes (34) and (35) onto dowel pins.
 - D. Remove tilt lever. (See Section 3F)
 6. Pivot pins (39).
 - Lubricate with lithium grease.
 - Press pin until firmly seated, two places.
 - Stake, three places.

Figure 28- Installing Column Housing to Housing Support

Figure 29 - Actuator Assembly to Actuator Rack Installed

7. Steering shaft bushing assembly (88) to jacket assembly (73).
 - Lubricate inner surface of bushing (88) with lithium grease.
8. Bearing adapter retainer (89).
9. Do steps 1 through 15, "Install or Connect", Sub Section B.
10. Do steps 1 through 21, "Install or Connect", Sub Section A.
11. Do all steps, "Install or Connect", **Ignition Switch Assembly**, Sub Section D.

SUB SECTION D - LOWER COLUMN INCLUDES:

**DIMMER SWITCH ASSEMBLY
DIMMER SWITCH ADJUSTMENT
IGNITION SWITCH ASSEMBLY
IGNITION SWITCH ADJUSTMENT
STEERING SHAFT BUSHING ASM**

NOTICE: Once steering column is removed from vehicle, the column is extremely susceptible to damage. Dropping steering column assembly on its end could collapse steering shaft or loosen plastic injections which maintain column rigidity. Leaning on steering column assembly could cause jacket to bend or deform. Any of the above damage could impair steering column's collapsible design. If it is necessary to remove steering wheel, use only the specified steering wheel puller. Under no conditions should the end of shaft be hammered on as hammering could loosen plastic injections which maintain steering column rigidity.

 Inspect

- Steering column for accident damage.
(See Figure 33)

**Dimmer Switch Assembly
Dimmer Switch Adjustment**

 Remove or Disconnect

Figures 1,2 and 27

- Disable the SIR system; refer to **"Disabling the SIR System"** in this Section.
- Negative (-) battery cable.
- Vehicle wire harness from dimmer switch (81)
- Washer head screw (#10-24x.25)(75).
- Dimmer Switch assembly (81) from dimmer switch rod (76).

 Install or Connect

Figures 1,2,27, and 30

NOTICE: See "Notice" on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying required torque. Failure to do so may result in component damage or malfunctioning of steering column.

- Dimmer Switch assembly (81) to dimmer switch rod (76) and flat head screw (80).
- Washer head screw (75).
 - Tighten finger tight.

Figure 30 - Adjusting Dimmer Switch

 Adjust

- Dimmer switch (81). (See Figure 30)
 - Place 3/32-inch drill bit in hole on switch to limit travel.
 - Position switch on column and push against dimmer switch rod (76) to remove all lash.
 - Remove drill bit.

 Tighten

- Tighten washer head screw (#10-24x.25) (75) to 4.0 N·m (35lb.in.)
- Vehicle wire harness to dimmer switch (81).
- Negative (-) battery cable.
- If all service operations are completed, enable the SIR system; refer to **"Enabling the SIR System"** in this Section.

Ignition Switch Assembly Ignition Switch Adjustment

Remove or Disconnect

Figures 1,2 and 27

1. Disable the SIR system; refer to **“Disabling the SIR System”** in this Section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)
4. Washer head screw (#10-24x.25) (75).
 - Dimmer switch assembly (81).
6. Flat head screw (#10-24x.31) (80).
 - Ignition switch assembly (79).
 - Ignition switch (79) from vehicle wire harness.

Install or Connect

Figures 1, 2,27 through 31

NOTICE: See “Notice” on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying required torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Lock cylinder (20) to “OFF-LOCK” position.

NOTICE: Install ignition switch assembly (79) with switch in “OFF-LOCK” position. (See Figure 31) New ignition switch will be pinned in “OFF-LOCK” position. Remove plastic pin after switch is assembled to column. Failure to do so may cause switch damage.

Figure 31 - Adjusting Ignition Switch

Adjust

- Ignition switch assembly (79). (See Figure 31)
 - A. Move switch slider to extreme right position.
 - B. Move switch slider one detent to left “OFF-LOCK” position.
 - C. Install 3/32 inch drill bit in hole on switch to limit travel.
- 2. Ignition switch assembly (79).
- 3. Flat head screw (#10-24x.31) (80).

Tighten

- Tighten flat head screw (80) to 4.0 N·m (35 lb.in.)
- 4. Remove drill bit from ignition switch (79).
- 5. Dimmer switch assembly (81) to dimmer switch rod (76) and flat head screw (80).
- 6. Washer head screw (75).
 - Tighten finger tight.

Adjust

- Dimmer switch asm (81). (See Figure 30)
 - A. Place 3/32-inch drill bit in hole on switch to limit travel.
 - B. Position Switch (81) on column and push to remove all lash.
 - C. Remove drill bit.

Tighten

- Tighten washer head screw (#10-24x.25) (75) to 4.0 N·m (35 lb.in.).
- 7. Steering column to vehicle. (See Section 3F)
- 9. Vehicle wire harness to ignition switch (79) and dimmer switch (81).
- 10. Negative (-) battery cable.
- 11. If all service operations are completed, enable the SIR system; refer to **“Enabling the SIR System”** in this Section.

Steering Shaft Bushing Asm

Remove or Disconnect

Figures 1,2, and 32

1. Disable the SIR system; refer to “**Disabling the SIR System**” in this Section.
2. Negative (-) battery cable.
3. Steering column from vehicle. (See Section 3F)
4. Bearing adapter retainer (89).
5. Steering shaft bushing assembly (88).

Figure 32 - Removing Steering Shaft Bushing

Install or Connect

Figures 1,2 and 32

NOTICE: See “**Notice**” on page 3F5B-1 of this section.

NOTICE: Ensure all fasteners are securely seated before applying needed torque. Failure to do so may result in component damage or malfunctioning of steering column.

1. Steering shaft bushing assembly (88) to jacket assembly (73).
 - Lubricate inner surface of bushing (88) with lithium grease.
2. Bearing adapter retainer (89).
3. Steering column to vehicle. (See Section 3F)
4. Negative (-) battery cable.
5. If all service operations are completed, enable the SIR system; refer to “**Enabling the SIR System**” in this Section.

CHECKING STEERING COLUMN FOR ACCIDENT DAMAGE

NOTICE: Vehicles involved in accidents resulting in frame damage, major body or sheet metal damage, or where the steering column has been impacted, or where supplemental inflatable restraints systems deployed may also have a damaged or misaligned steering column.

CHECKING PROCEDURE**JACKET ASM, STEERING COLUMN**

- Check capsules on steering column bracket assembly; all must be securely seated in bracket slots and checked for any loose conditions when pushed or pulled by hand (View A). If not, bracket should be replaced if bracket is bolted to the jacket assembly or the jacket assembly should be replaced if bracket is welded to jacket assembly.
- Check for jacket assembly collapse by measuring the distance from the lower edge of upper jacket to a defined point on the lower jacket (View C). If measured dimensions are not within specifications, a new jacket must be installed.

STEERING SHAFT ASM

- Visually inspect steering shaft for sheared injected plastic (View B). If steering shaft shows sheared plastic, a new steering shaft must be installed.

NOTICE: Inflatable restraint coil assembly must be removed from steering column and allowed to hang freely before shaft is rotated. Failure to do so could damage coil assembly.

- Any frame damage that could cause a bent steering shaft must have steering shaft runout checked in the following manner: Using a dial indicator at lower end of steering shaft, have steering wheel rotated. Runout must not exceed 1.59mm.

SECTION 4A

PROPELLER SHAFT

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

PROPELLER SHAFT

Figure 1

Torque is transmitted from the transmission to the differential through the propeller shaft (5) and the universal joints. The shaft (5) is a one piece balanced tubular type.

A universal joint and splined propeller shaft slip yoke (1) are located at the transmission end of the shaft (5) where they are held in alignment by a bushing in the automatic transmission case extension. The slip yoke (1) permits fore-and-aft movement of the shaft (5) as the differential moves up and down. The spline is lubricated internally by the transmission lubricant. An oil seal in the automatic transmission case extension prevents fluid leakage and protects the slip yoke (1) from dust, dirt and other harmful material.

A second universal joint is used where the shaft (5) connects to the differential drive pinion gear yoke.

If a vehicle is to be undercoated, the shaft (5) must be kept completely free of undercoating material. Undercoating material or any other foreign material will upset the propeller shaft balance and produce a serious vibration.

UNIVERSAL JOINT

The universal joint is basically two Y-shaped yokes connected by a crossmember called a spider. The spider is shaped like a cross and the arms that extend from it are called trunnions. The spider allows the two yoke shafts to operate at an angle to each other. Factory installed universal joints are lubricated for life, but service universal joints have grease fittings and require periodic lubrication. For more information, refer to "Lubrication" in this section.

When torque is transmitted through any ordinary universal joint, the driven yoke fluctuates slightly in speed. In other words, although the propeller shaft slip yoke rotates at a constant speed, the differential drive pinion gear yoke speeds up and slows down twice per revolution. This fluctuation of the pinion gear yoke is in direct proportion to the angle through which the universal joint is operating; the greater the angle, the greater the fluctuation.

Whenever two universal joints are used, this fluctuation effect can be eliminated by staggering the joints so that the two yokes are 90 degrees apart provided the two joints are transmitting torque through the same angle.

Therefore, when two universal joints are used, the angles through which they operate must be very nearly the same. This allows the alternate acceleration and deceleration of one joint to be offset by the

4A-2 PROPELLER SHAFT

Figure 1 - Propeller Shaft Components

alternate deceleration and acceleration of the second joint. When the two joints do not run at approximately the same angle, operation is rough and an objectionable vibration is produced.

Universal joints are designed to handle the effects of various loadings and rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded, the operational life of the universal joint may decrease.

The universal joint spider bearings used are the needle roller type. The needle roller bearings are held in place on the trunnions by round bearing caps. Production universal joint bearings are retained by nylon injected rings instead of conventional retainer (snap) rings. All service replacement universal joints use retainer (snap) rings.

If it becomes necessary to replace a universal joint, the entire propeller shaft must be removed from the vehicle. Care should be taken to avoid jamming or bending any parts of the propeller shaft.

DIAGNOSIS

The following major component groups are usually the cause of or are related to vibration.

- Engine and engine mounts.
- Transmission.
- Tire, wheel, brake drum and brake rotors.
- Propeller shafts and universal joints.

Before road testing a vehicle, check the following:

- All fasteners for tightness at universal joint, wheel nuts and engine mounts.
- Tire air pressure and condition.
- Load conditions.

ROAD TEST

Road test the vehicle to verify the complaint. Record the speed and rpm at which the greatest vibration occurs. The vibration is likely to be in the steering wheel or in the seat bottom. The road test can be helpful in locating the vibration source.

COAST TEST

NOTICE: When performing a "Coast Test" on a vehicle equipped with an automatic transmission, caution must be taken when returning automatic transmission control lever from "NEUTRAL" to "DRIVE" to avoid transmission damage.

When shifting from "NEUTRAL" to "DRIVE," remember to:

1. Maintain engine speed at 1500 rpm.
2. Brake to 40 km/h (25 mph).
3. Return automatic transmission control lever to "DRIVE."

Drive the vehicle past the vibration speed, shift into "NEUTRAL" and coast back through the vibration speed. During a coast test, two kinds of vibration normally occur: a shaking or a buzzing. A shaking vibration is usually a problem with the tire, wheel, brake drum or brake rotors. A buzzing vibration is usually a drive-line problem.

To determine whether the propeller shaft is causing the problem, drive the vehicle through the speed range and note at which speed (vehicle and/or engine) the problem is most pronounced. A tachometer may be used. Shift the transmission into a lower gear range and drive the vehicle at the same engine speed as when the problem was most pronounced in direct drive. Note the effect on the problem.

To determine the engine speed if a tachometer is not used, divide vehicle speed by the transmission gear ratio in which the problem occurs.

Example: When the HYDRA-MATIC 4L60 automatic transmission is in 2 range, divide by 1.63. If the problem is most pronounced in direct drive at 88 km/h (55 mph) the same engine speed would be produced in 2 range at 55 km/h (34 mph).

If the problem is still present at the same engine speed whether in direct drive or in the lower gear

range, the propeller shaft cannot be at fault since the propeller shaft speed varies. If the problem decreases or is eliminated in a different gear range at the same engine speed, the propeller shaft may be at fault. Refer to "Propeller Shaft Runout Measurement" under "On-Vehicle Service," "Diagnosis of Propeller Shaft and Universal Joint" and Figure 2.

DIAGNOSIS OF PROPELLER SHAFT AND UNIVERSAL JOINT

PROBLEM	POSSIBLE CAUSE	CORRECTION
Leak at front propeller shaft slip yoke. (An occasional drop of lubricant leaking from slip yoke is normal and requires no attention.)	1. Rough outside surface on propeller shaft slip yoke. 2. Faulty rear automatic transmissions oil seal.	1. Replace transmission seal if cut by burrs on slip yoke. Minor burrs can be smoothed by careful use of crocus cloth or honing with a fine stone. Replace slip yoke if outside surface is rough or burred badly. 2. Replace rear automatic transmission oil seal. Bring automatic transmission fluid up to proper level after correction.
Knock in driveline; clunking noise when vehicle is operated under float condition at 16 km/h (10 mph) in high gear or "NEUTRAL."	1. Worn or damaged universal joints. 2. Differential side gears worn.	1. Replace universal joints. 2. Replace differential side gears as required.
Ping, snap, or clicking noise in driveline.	1. Loose rear axle upper or lower control arm bolt/screw. 2. Worn or damaged universal joints.	1. Tighten bolt/screw to specified torque. 2. Replace universal joint.
Scraping noise	1. Slinger rubbing on the rear axle carrier. 2. Brake drum contacting backing plate.	1. Straighten the slinger to remove interference. 2. Replace brake drum or backing plate.

PROPELLER SHAFT DIAGNOSIS

Figure 2 - Propeller Shaft Diagnostic Chart

Figure 3 - Checking Propeller Shaft Runout

ON-VEHICLE SERVICE

PROPELLER SHAFT RUNOUT MEASUREMENT

Figure 3

Tool Required:

J 8001 Dial Indicator Set

Noise or vibration at high speed could be caused by a bent propeller shaft. The propeller shaft could have been damaged by rough handling or a collision. Check for propeller shaft straightness.

1. Place transmission in "NEUTRAL."
2. Raise vehicle on twin post hoist so rear is supported on rear axle housing and wheels can spin. Refer to SECTION 0A.
3. Mount J 8001 on a movable support that is high enough to permit contact of indicator button with propeller shaft, or mount J 8001 to magnetic base and attach it to smooth place on vehicle underbody. Readings are to be taken at points A, B and C.
4. Check for runout by turning rear wheels to rotate propeller shaft.
5. If runout exceeds specifications, disconnect propeller shaft at differential drive pinion gear yoke and rotate propeller shaft 180 degrees. Reinstall propeller shaft. Check runout again.
6. If runout is still over specifications at differential drive pinion gear yoke end, differential drive pinion gear yoke runout should be measured. Refer to "Differential Drive Pinion Gear Yoke Runout Measurement" below. If runout is still over specifications, replace propeller shaft, but only after checking for vibration or noise.
7. Lower vehicle.

DIFFERENTIAL DRIVE PINION GEAR YOE RUNOUT MEASUREMENT

Figure 4

Tools Required:

J 35819 Runout Gage

J 8001 Dial Indicator Set

Important

- The driveline components in this vehicle have been factory system balanced. System balance provides a smoother running driveline operation. However, it is essential that positions of all driveline components relative to propeller shaft and rear axle be observed and **ACCURATELY** REFERENCE MARKED PRIOR TO

Figure 4 - Differential Drive Pinion Gear Yoke Runout

4A-6 PROPELLER SHAFT

DISASSEMBLY. These components include propeller shaft, rear axle assembly and differential drive pinion gear yoke. **ALL COMPONENTS MUST BE REASSEMBLED INTO THE EXACT RELATIONSHIP TO EACH OTHER AS THEY WERE WHEN REMOVED.**

Additionally, published specifications and torque values, as well as any measurements made prior to disassembly must be followed to maintain factory balance.

1. Raise vehicle on twin post hoist so rear is supported on rear axle housing and wheels can spin. Refer to SECTION 0A.
2. Measure pinion gear yoke runout using J 35819 and J 8001. Record runout and mark high and low points of pinion gear yoke.
3. If pinion gear yoke runout is 0.38 mm (0.015 inch) or less, no further action is required.
4. If pinion gear yoke runout is greater than 0.38 mm (0.015 inch), replace pinion gear yoke with a service pinion gear yoke. Refer to SECTION 4B.
 - Service replacement pinion gear yokes may be equipped with balance weights and weights **MUST NOT** be removed.
5. Lower vehicle.

UNIVERSAL JOINT ANGLE MEASUREMENT

Figure 5

The front universal joint angle is actually the angle between engine-transmission centerline and

propeller shaft centerline. This angle is determined by design of frame and may be altered by adding or removing shims between transmission and transmission mount. Refer to SECTION 7A.

Rear universal joint angle corrections of + or -1 degree can be made by loosening all of rear suspension control arm bolts and repositioning pinion nose up or down. This takes advantage of all bolt/screw hole tolerances in brackets. Refer to SECTION 3D.

Adding one shim at transmission mount will decrease transmission-universal joint angle by 1/2 degree and increase differential joint angle by 1/4 degree. If one shim is removed, transmission angle will increase 1/2 degree and decrease differential angle 1/4 degree. The production transmission mount bolt/screw is an M10-1.5 x 35 mm. When installing two or more shims, an M10-1.5 x 50 mm bolt/screw must be used.

All vehicles with propeller shaft vibration complaints should be checked for correct rear trim height measurements at curb weight. An incorrect trim height may cause some vibration. If any irregular roughness or vibration is detected in driveline, front and rear universal joint angles should be checked. If a vehicle is involved in a severe rear end collision, or if rear axle housing is replaced, rear universal joint angle should be checked and corrected if necessary.

Figure 5 - Axle Tube-to-Frame Trim Height

Universal Joint Angle Specifications Chart

MODEL	AXLE	SUSPENSION	TIRE SIZE	TRIM HEIGHT* (+ or - 10mm (0.39 in.))	FRONT UNIVERSAL JOINT ANGLE (+ or - 0.3°)	REAR UNIVERSAL JOINT ANGLE (+ or - 0.3°)

* TOP OF AXLE TUBE TO BOTTOM OF FRAME TRIM HEIGHT SPECIFICATION

Inclinometer Method

Figure 5

This method can be used with vehicle over a pit or on a drive-on platform hoist as long as vehicle is at curb weight with a full tank of gasoline. Before universal joint angles can be checked, measurements specified for distance between top of axle tube and bottom of frame must be met. To ensure an accurate measurement, cut two 6-inch blocks of wood and place between axle tube and frame on both sides. Add weight to rear compartment until frame contacts the blocks of wood.

Readings should be taken at following locations in following manner:

ANGLE AT REAR UNIVERSAL JOINT

Figure 6

Tool Required
J 23498-A Driveshaft Inclinometer

Measure

1. Rotate propeller shaft until rear universal joint bearing cap pressed into propeller shaft is facing straight down.

4A-8 PROPELLER SHAFT

Figure 6 - Measuring Angle at Rear Universal Joint

2. Place inclinometer J 23498-A on rear universal joint bearing cap. Center bubble in sight glass and record measurement. Bearing cap must be straight up and down and free of dirt or other foreign material to obtain an accurate measurement.
3. Rotate propeller shaft 90 degrees and place inclinometer on differential drive pinion yoke bearing cap. Center bubble in sight glass and record measurement.
4. Subtract smaller figure from larger figure to obtain universal joint angle.
5. Compare with "Specifications" at the end of this section.

ANGLE AT FRONT UNIVERSAL JOINT

Figure 7

Tools Required:

J 23498-A Driveshaft Inclinometer

J 23498-20 Driveshaft Inclinometer Adapter

Measure

1. Rotate propeller shaft until front universal joint bearing cap pressed into propeller shaft is facing straight down.
2. Place inclinometer on front universal joint bearing cap. Center bubble in sight glass and record measurement.
3. Rotate propeller shaft 90 degrees and place inclinometer on propeller shaft slip yoke bearing cap. Center bubble in sight glass and record measurement.
4. Subtract smaller figure from larger figure to obtain front universal joint angle.
5. Compare with "Specifications" at the end of this section.

PROPELLER SHAFT BALANCE CHECK

Remove or Disconnect

NOTICE: Refer to "Notice" on page 4A-1 of this section.

1. Disable traction control system by pressing switch in instrument panel compartment.
2. Raise vehicle on twin post hoist so wheels can spin. Refer to SECTION 0A.
3. Tire and wheels. Refer to SECTION 3E.
4. Install wheel nuts with flat sides against rear brake drum.

Inspect

- Propeller shaft, universal joint, and attachments for mud, undercoating or loose fasteners.

Figure 7 - Measuring Angle at Front Universal Joint

Clean

- Propeller shaft, universal joint, and attachments. Do not use solvents to clean propeller shaft.

Tighten

- Any loose attachments or fasteners to specifications. Refer to "Specifications" in this section.

CAUTION: Do not run vehicle faster than 88 km/h (55 mph). Stay clear of universal joint and balance weight areas to avoid possible personal injury. Do not run vehicle on hoist for extended periods due to danger of overheating transmission or engine.

- Run vehicle in gear at speed where disturbance peaks. Observe intensity of disturbance.

NOTICE: Allow driveline components to stop rotating transmission in "NEUTRAL" before placing transmission in "PARK" or parts may be damaged.

- Stop engine.

- Propeller shaft from pinion gear yoke only. Refer to "Propeller Shaft Replacement" in this section.
 - Rotate shaft 180 degrees from original position.

Install or Connect

- Propeller shaft to pinion gear yoke. Refer to "Propeller Shaft Replacement" in this section.
- Remove wheel nuts.
- Wheel and tires. Refer to SECTION 3E.
- Determine position that gives best driveline response by road testing vehicle for final check of propeller shaft balance.
- Cycle ignition to enable traction control system.
- If balance is unacceptable, refer to "Propeller Shaft Balancing" in this section.

PROPELLER SHAFT BALANCING

Hose Clamp Method

Figures 8 through 10

- Disable traction control system by pressing switch in instrument panel compartment.
- Place vehicle on twin post hoist so that rear of vehicle is supported on rear axle housing and rear wheels are free to rotate. Refer to SECTION 0A.
- Remove both rear tire and wheels. Refer to SECTION 3E. Install wheel nuts with flat sides next to rear brake drum.
- Mark and number shaft (5) at four points, 90 degrees apart, at rear of shaft (5) just forward of balance weight.

Figure 8 - Propeller Shaft Reference Marks

Figure 9 - Balance Hose Clamps

Figure 10 - Rotating Balance Hose Clamps

4A-10 PROPELLER SHAFT

5. Install two clamps (6) on rear of shaft (5) and slide them rearward until clamps (6) stop at nearest balance weight welded to tube.

- Align both clamps (6) at any one of four reference marks made on shaft (5) in step 4 and tighten.

CAUTION: Do not run vehicle faster than 88 km/h (55 mph). Stay clear of universal joint and balance weight areas to avoid possible personal injury. Do not run vehicle on hoist for extended periods due to danger of overheating transmission or engine.

6. Run vehicle through speed range to 81-88 km/h (50-55 mph). Note amount of imbalance felt at front of rear axle housing.
7. Loosen clamps (6) and rotate clamp heads 90 degrees to next mark on shaft (5). Tighten clamps (6) and repeat step 6.

Figure 11 - Pick-Up Unit at Differential Drive Pinion Gear Yoke

8. Repeat step 7 until vehicle has been run with clamp heads located at all four marks on shaft (5).
9. Position clamps (6) at point of least imbalance. Rotate clamp heads away from each other 45 degrees, one on each side of position.

- A. Run vehicle and note if balance has improved.
- B. In some cases it may be necessary to use one clamp (6) or possibly three clamps (6) in order to obtain good balance.
- C. Replace shaft (5) if three clamps (6) do not improve balance.

10. Continue to rotate clamps (6) apart in smaller angular increments until imbalance is at its minimum.
11. Remove wheel nuts.
12. Install tire and wheels. Refer to SECTION 3E.
13. Lower vehicle.
14. Cycle ignition to enable traction control system.
15. Road test vehicle to check final balance.

- A small vibration felt while vehicle is on hoist may not be noticed on road test.

Strobe Light Method

Figures 8 through 12

If a strobe-light type wheel balancer is used, it will help in balancing of propeller shaft. The balance pick-up unit should be placed directly under nose of rear axle housing and as far forward as possible. Make up an extension for balance pick-up unit by using 3/8-inch tube and compression fittings (Figure 11).

1. Disable traction control system by pressing switch in instrument panel compartment.
2. Place vehicle on twin post hoist so rear of vehicle is supported on rear axle housing and rear wheels are free to rotate. Lower rear hoist and allow rear axle housing to rest on jackstands.
3. Remove both rear tire and wheels. Refer to SECTION 3E. Install wheel nuts with flat sides next to rear brake drums. System is now released and free to respond to shaft (5).
4. Mark and number shaft (5) at four points, 90 degrees apart, at rear of shaft (5) just forward of balance weights.
5. Place strobe light wheel balancer pick-up under pinion gear yoke in contact with rear axle housing and as far forward as possible.

CAUTION: Do not run vehicle faster than 88 km/h (55 mph). Stay clear of universal joint and balance weight areas to avoid possible personal injury. Do not run vehicle on hoist for extended periods due to danger of overheating transmission or engine.

6. Run vehicle in gear at speed where disturbance is at its peak.
7. Allow driveline to stabilize by holding at steady speed.

Figure 12 - Positioning Hose Clamps to Achieve Best Balance

8. Point strobe light up at spinning shaft (5) and note position of one of reference numbers.

NOTICE: Allow driveline components to stop rotating with transmission in “NEUTRAL” before placing transmission in “PARK” or parts may be damaged.

9. Shut off engine.
10. Position shaft (5) so reference numbers will be in same position as was noted while shaft (5) was rotating.
 - When strobe light flashed, heaviest point of shaft (5) was at bottom (6 o'clock). To balance shaft (5), it would be necessary to apply balancing weights (hose clamps) 180 degrees away from heaviest point or at top of shaft (5) (12 o'clock).
11. Install two screw-type clamps (6) on shaft (5) as close to rear as possible. Position both clamp heads 180 degrees from heaviest point of shaft (5) as indicated by strobe light. Tighten clamps (6).
12. Run vehicle through speed range 81-88 km/h (50-55 mph).
 - A. If disturbance is not gone and strobe light shows clamp heads at bottom (6 o'clock) of shaft (5), go to step 13.
 - B. If strobe light shows two clamp heads at top of shaft (5), add one more clamp (6) and check.
 - C. If strobe light shows clamp heads at top of shaft (5), remove shaft (5) and rotate 180 degrees on pinion gear yoke. Check again, without clamps (6).
 - D. Repeat balancing, starting with step 11.
 - E. If shaft (5) still needs more than three clamps (6) at same clock position, replace shaft (5).
 - F. If clamps (6) are also 180 degrees from their original position after rotating shaft (5) 180 degrees, pinion gear yoke is out of balance and must be replaced.

! Important

- Do not use more than three clamps (6) to balance shaft (5).
- G. If strobe light shows clamps (6) at bottom of shaft (5), but disturbance still exists, go to step 13.
 13. Rotate two of clamps (6) equally away from each other toward top (one on each side of position) in small increments until best balance is achieved. In some cases it may be necessary to use one clamp (6) or possibly three clamps (6) in order to obtain good balance. Replace shaft (5) if three clamps (6) do not correct problem.
 14. Remove wheel nuts.
 15. Install tire and wheels. Refer to SECTION 3E.
 16. Remove strobe light and lower vehicle.
 17. Cycle ignition to enable traction control system.
 18. Road test vehicle to check final balance.
 - A small vibration felt while vehicle is on hoist, may not be noticed on road test.

PROPELLER SHAFT REPLACEMENT

Figure 13

↔ Remove or Disconnect

NOTICE: Do not strike or drop propeller shaft, or allow universal joints to bend to extreme angles, as this might fracture a joint internally.

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Mark relationship of shaft (5) to pinion gear yoke (9).
3. Four bolts/screws (7).
4. Two retainers (8).
5. Shaft (5) by withdrawing slip yoke (1) from transmission, moving shaft (5) rearward and passing it under axle housing (10).

4A-12 PROPELLER SHAFT

Figure 13 - Propeller Shaft

- On shaft (5), if bearing caps are loose, tape them together to prevent dropping and losing needle roller bearings.

Inspect

- Transmission rear seal for damage.
- Transmission output shaft splines for burrs.
- Outer diameter of slip yoke (1) for burrs.
- Splines of slip yoke (1) for damage, twisting or wear. They should agree in number and fit with transmission output shaft splines.
- Pinion gear yoke (9) for burrs or foreign material.

Install or Connect

NOTICE: Refer to “Notice” on page 4A-1 of this section.

NOTICE: The propeller shaft must be handled carefully to avoid jamming or bending any parts.

NOTICE: To prevent rear automatic transmission oil seal damage, do not place any tool between propeller shaft slip yoke and seal.

1. Slip yoke (1) onto transmission output shaft after lubricating spline with approximately 18 gm (0.6 ounce) of propeller shaft slip yoke lubricant GM P/N 1050169, or equivalent.

Important

- When making rear shaft connection, be sure to align mark on pinion gear yoke (9) with mark on shaft (5).
2. Propeller shaft (5) to pinion gear yoke (9).
 - On shaft (5), rear universal joint bearing caps must be fully seated in pinion gear yoke (9).
 3. Two retainers (8), if removed.
 4. Four bolts/screws (7).

Tighten

- Bolts/screws (7) evenly to 22 N·m (16 lb. ft.).
 - Bolts/screws (31) evenly to 95 N·m (70 lb. ft.).
5. Lower vehicle.

Adjust

- Transmission fluid level. Refer to SECTION 7A.

UNIT REPAIR

UNIVERSAL JOINTS

When taking apart a propeller shaft, two types of universal joints may be found: nylon injected ring and snap ring.

NOTICE: Never clamp propeller shaft tubing or slip yoke sealing surface in a vise, as they may be damaged. Always clamp on one of propeller shaft ends and support shaft horizontally. Mark slip joint and propeller shaft to ensure correct reassembly.

Nylon Injected Ring Type

Figures 14 through 16

Tools Required:

J 9522-3 U-Joint Bearing Separator

J 9522-5 U-Joint Bearing Spacer Remover

Disassemble

1. Support shaft in horizontal position in line with base plate of a press.
2. Place universal joint so that lower ear of yoke is supported on a 1 1/8-inch socket.
3. Lower bearing cap (12) out of yoke ear by placing J 9522-3 on open horizontal bearing caps (12) and pressing lower bearing cap (12) out of yoke ear. This shears nylon injected ring on lower bearing cap (12). If bearing cap (12) is not completely removed, lift J 9522-3 and insert J 9522-5 between seal and bearing cap (12).
4. Press bearing cap (12) out of yoke.
5. Rotate shaft. Shear opposite nylon injected ring.
6. Opposite bearing cap (12) out of yoke.
7. Spider (4) from yoke.

- If front universal joint is being replaced, remove pair of bearing caps (12) from propeller shaft slip yoke in same manner.

Figure 14 - Pressing Out Universal Joint Bearing

Figure 15 - Installing Universal Joint Bearing Spacer Remover

Figure 16 - Servicing Universal Joint

Clean

- Yoke in area locating retainer ring (2) to insure proper.
- All sheared nylon from universal joint cup bore.

NOTICE: Production universal joints of this type cannot be reassembled. Nylon injected ring types are replaced by external snap ring types.

4A-14 PROPELLER SHAFT

When reassembling a propeller shaft, always install a complete universal joint service kit. This kit includes one pregreased spider (4), four service bearing caps with seals (17), needle roller bearings (15), delrin round washers (14), delrin flat washers (16), grease and four retainer rings (2). Make sure that seals (17) are in place on service bearing caps (12) to hold needle roller bearings (15) in place during handling.

Assemble

For universal joint procedure, refer to "Snap Ring Type" in this section.

Snap Ring Type

Figures 14 through 19

Tools Required:

J 9522-3 U-Joint Bearing Separator

J 9522-5 U-Joint Bearing Spacer Remover

These universal joints are designed for extended life and do not require periodic inspections or lubrication. When these joints are taken apart, repack bearings and lubricant reservoir at end of trunnions with chassis lubricant GM P/N 1052356 or GM P/N 1052497 or equivalent. Use care not to loosen or damage dust seals. If dust seals are loose or damaged replace entire universal joint.

Disassemble

1. Retainer rings (2). If retainer ring (2) does not readily snap out of grooves, tap end of bearing cap (12) lightly to relieve pressure against retainer ring (2).
2. Support shaft in a horizontal position in line with base plate of a press.

Figure 17 - Partially Inserted Bearing Cap

Figure 18 - Installing Propeller Shaft Universal Joint Spider Bearing Retainer Ring

3. Place universal joint so lower ear of yoke is supported on a 1 1/8-inch socket.
4. Lower bearing cap (12) out of yoke ear. Place J 9522-3 on open horizontal bearing cap (12). If bearing cap (12) is not completely removed, lift J 9522-3 and insert J 9522-5 between seal (17) and bearing cap (12) being removed. Complete removal of bearing cap (12) by pressing it out of yoke.
5. Rotate shaft and press opposite bearing cap (12) out of yoke.
6. Spider (4) from yoke.

Assemble

1. One bearing cap (12) part way into one side of yoke. Turn this yoke ear to bottom.
 - Insert J 9522-3 seating trunnion (11) in bearing cap (12).
2. Opposite bearing cap (12) part way.

Inspect

- Both trunnions (11) to ensure positioning is straight and true into bearing caps (12).
3. Press against opposite bearing caps (12), working spider (4) all of time to ensure free movement of trunnions (11) in bearings.

Figure 19 - Seating Propeller Shaft Universal Joint Spider Bearing Retainer Ring

Inspect

- Needle roller bearings (15) for binding. If binding, one or more needle roller bearings (15) has probably tipped under end of trunnion (11).
- 4. Stop pressing when one bearing retainer groove clears inside of yoke.
- 5. Retainer ring (2) by pressing into place.
 - Continue pressing until opposite side can be snapped into place. If needed, strike yoke firmly with hammer to aid in seating them. This springs yoke ears slightly.
- 6. Repeat steps 1 through 5 for other half of the universal joint.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

REAR AXLE

Figures 1 and 2

The rear axle differential is a semi-floating type in which the vehicle weight is carried on the housing (37). The differential is designed for use with an open

driveline and coil springs. The differential has a hypoid type ring gear (3) with the centerline of drive pinion gear (16) below the centerline of ring gear (3).

All parts necessary to transmit power from the propeller shaft to the rear wheels are enclosed in housing (37). A removable steel cover (14) bolted to the rear of housing (37) permits service of the rear axle without removing it from the vehicle.

BS0024B

Figure 2 - Rear Axle - Legend

A universal joint connects the rear end of the propeller shaft to yoke (25), having a splined end which fits over and drives the drive pinion gear (16). Two preloaded tapered roller bearings support drive pinion gear (16) in housing (37). The race of inner bearing (18) and outer bearing (23) are a tight press fit in housing (37). Inner bearing (18) is a tight press fit onto drive pinion gear (16). Outer bearing (23) combines a light press fit with a close sliding fit on the yoke end of the differential drive pinion gear stem.

Located on the differential drive pinion gear shaft is the rear wheel speed sensor ring used by the Antilock Brake System (ABS) and Traction Control System (TCS) to transmit rear wheel speed information. The sensor ring is a press fit on the pinion shaft and is not reusable. For more information refer to SECTION 5E2.

Tightening nut (27) compresses a collapsible spacer (22) that bears against outer bearing (23) and inner bearing (18). This spacer (22) is used to enable automatic bearing preload adjustment and maintain a preload on both inner and outer bearings (18 and 23). Adjustment of the fore-and-aft position of drive pinion gear (16) is obtained by placing selective shims (17) between the head of drive pinion gear (16) and inner bearing (18).

Case (7) is one piece and is supported in housing (37) by two tapered roller bearings (4). These are preloaded by inserting shims (1) between bearings (4) and housing (37). Case (7) is positioned for proper differential ring gear to differential drive pinion gear backlash by varying the shim thickness from side to side. Ring gear (3) is bolted to case (7).

Two side gears (10) have splined bores for driving shafts (39). They are positioned to turn in counterbored cavities in case (7). The two pinion gears (12) have smooth bores and are held in position by a solid shaft (6), mounted and locked in case (7). All four gears are in mesh with each other. Pinion gears (12) turn freely on shaft (6), acting as idler gears when the rear wheels are turning at different speeds. Pinion gears (12) and side gears (10) are backed by steel thrust washers (9 and 11).

Operation

When the vehicle turns a corner, the differential allows the outer rear wheel to turn faster than the inner wheel. The inner wheel, turning slower with respect to the outer wheel, slows its rear differential side gear (as the shaft is splined to the differential side gear). The differential pinion gears roll around the slowed differential side gear, driving the other differential side gear and wheel faster.

LIMITED SLIP REAR AXLE

Limited slip rear axles have several definite operating characteristics. An understanding of these characteristics is necessary to aid diagnosis.

The energizing force comes from the thrust side of the gears. Consequently, a free spinning wheel may not have enough resistance to driving torque to apply the cones. If this occurs, applying the parking brake a few notches will provide enough resistance to energize the cones.

4B-4 REAR AXLE

Energizing the cones is independent of acceleration; therefore, a very slow application of the throttle on starting is recommended to provide maximum traction by preventing "break away" of either rear wheel.

All rear axle parts of vehicles with the limited slip rear axle are interchangeable with those equipped with the standard rear axle, except for the differential case. It is similar in all respects to the standard differential case, with the addition of cone clutches splined to each side gear. The Auburn limited slip differential case is non-serviceable and must be replaced.

REAR AXLE IDENTIFICATION

Figure 3

The axle identification code and manufacturer's code must be known before attempting to adjust or repair axle shafts or the differential. Rear axle ratio, differential type, manufacturer, and build date information is stamped on the right axle tube on the forward side, or is stamped on a metal tag on the housing cover. The service parts identification label also has RPO codes for the axle printed on it.

MAINTENANCE AND LUBRICATION

Figures 1 and 2

NOTICE: Refer to "Notice" on page 4B-1 of this section.

To check or add rear axle lubricant, hoist vehicle at suspension contact points. Refer to SECTION 0A. Keep vehicle level. Clean dirt or foreign material from around rear axle housing plug opening before removing plug (21). Maintain axle lubricant level from flush with bottom of opening to no lower than 15 mm (9/16 inch) below opening. Use GM P/N 1052271, or equivalent. Always replace plug (21).

Tighten

- Bolt/screw to 35 N.m (26 lb. ft.).

Limited slip differentials should have fluid drained and refilled at the first 12 500 km (7,500). Be sure to add limited slip additive GM P/N 1052358, or equivalent.

If the vehicle is used to pull a trailer, change rear axle lubricant every 12 500 km (7,500 miles) of trailer tow use.

DIAGNOSIS

Many noises reported as coming from the axle actually originate from other sources such as tires, road surfaces, wheel bearings, engine, transmission, muffler or body. A thorough and careful check should be made to determine the source of the noise before taking apart the axle. Noise which originates in other places cannot be corrected by adjustment or replacement of parts in the axle. Rear axle differential gears, like any other mechanical device, are not absolutely quiet and should be accepted as being commercially quiet unless some abnormal noise is present.

To make a systematic check for axle noise under standard conditions, observe the following:

1. Check rear axle lubricant to assure correct level, then drive vehicle far enough to thoroughly warm up rear axle lubricant.
2. Select a level asphalt road to reduce tire noise and body drumming.
3. Note speed at which noise occurs. Then stop vehicle and with automatic transmission control lever in "NEUTRAL," run engine slowly up and down through engine speeds, corresponding to vehicle speed at which noise was most pronounced, to determine if it is caused by exhaust, muffler roar, or other engine conditions.
4. Tire noise changes with different road surfaces, but rear axle noise does not. Temporarily inflating all tires to approximately 345 kPa (50 psi) for test purposes only, will alter noise caused by the tires, but will not affect noise caused by the axle. Axle noise usually stops when coasting at speeds under 48 km/h (30 mph). Tire noise continues, but with

Figure 3 - Rear Axle Identification

a lower tone as vehicle speed is reduced. Axle noise usually changes when comparing drive and coast, but tire noise remains about the same.

- Distinguish between tire noise and axle noise by noting if noise varies with various speeds or sudden acceleration and deceleration. Exhaust and axle noises show variations under these conditions while tire noise remains constant and is more noticeable at speeds of 32 to 48 km/h (20 to 30 mph). Check for tire noise by driving vehicle over smooth pavement or dirt roads (not gravel) with tires at normal pressure. If noise is caused by tires, it will noticeably change or disappear and appear again with changes in the road surface.
- 5. Loose or rough front wheel inner or outer bearings will cause a noise which may be confused with rear axle noise. Front wheel inner or outer bearing noise does not change when comparing drive and coast. Light application of the brake pedal while holding the vehicle speed steady will often cause front wheel inner or outer bearing noise to diminish, as this takes some weight off the bearing. Front wheel inner or outer bearings may be easily checked for noise by jacking up the wheels and spinning them or by shaking the wheels to determine if they are loose.
- 6. Rear suspension rubber bushings and spring insulators dampen out axle noise when correctly installed. Check that no metallic contact exists between the spring and spring opening in the frame or between upper and lower control arm bushings and frame or axle housing brackets. Metal-to-metal contact at those points may result in telegraphing road noise and normal axle noise which would not be objectionable if dampened by bushings.
- 7. Make sure that the floor of the body is not in metallic contact with the frame.

REAR AXLE NOISES

Gear Noise

After the noise has been determined as being in the axle, the type of noise should be established to help in making repairs if necessary.

Gear noise (whine) is audible from 32 to 89 km/h (20 to 55 mph) under four driving conditions:

1. Drive - Acceleration or heavy pull.
2. Road Load - Vehicle driving load or constant speed.
3. Float - Using enough throttle to keep the vehicle from driving the engine, the vehicle slows down gradually but the engine still pulls slightly.
4. Coast - Throttle closed and vehicle in gear. Gear noise most frequently has periods where noise is more noticeable, usually 48 km/h to 64 km/h (30 mph to 40 mph) and 80 km/h to 89 km/h (50 mph to 55 mph).

Bearing Noise

Bad bearings generally produce more of a rough growl or grating sound, rather than the whine typical of gear noise. Bearing noise frequently "wow-wows" at constant bearing rpm, indicating a faulty differential pinion or side bearing. This noise could easily be confused with rear axle shaft bearing noise. Inspect and replace as required.

Rear Axle Shaft Bearing Noise

A rough bearing produces a noise that continues with the vehicle coasting at low speed and automatic transmission control lever in "NEUTRAL." Noise may diminish with gentle braking. With rear wheels jacked up, spin rear wheels by hand while listening at hubs for evidence of rough (noisy) bearing.

Knock at Low Speeds

Low-speed knock can be caused by a worn universal joint or a differential side gear hub counterbore in the differential case worn oversize. Inspect and replace universal joint or the differential case and differential side gear as required.

Backlash Clunk

Excessive clunk with acceleration and deceleration is caused by worn differential pinion gear shaft, worn differential case, excessive clearance between the axle shaft and differential side gear splines, excessive clearance between differential side gear hub and counterbore in case, worn differential pinion and side gear teeth, worn differential pinion gear thrust washers and excessive differential drive pinion gear-to-differential ring gear backlash. Remove worn parts and replace as required, selecting close fitting parts when possible. Adjust differential drive pinion gear-to-differential ring gear backlash. Refer to "Differential Ring Gear-to-Differential Drive Pinion Gear Backlash" under "Unit Repair" in this section.

LIMITED SLIP REAR AXLE

Improper operation is generally indicated by cone slippage or grabbing. Sometimes this produces a chatter or whirring sound. These sounds are not always indicative of failure as they could be produced from lack of proper lubrication. For example, under certain conditions where one wheel is on a very slippery surface and the other is on dry pavement, wheel spin can occur if hard acceleration is attempted. Continued spinning may cause audible noise, such as a whirring sound, due to the cones lacking sufficient lubricant. This does not necessarily indicate a failure of the unit.

During regular operation (straight ahead driving) when both wheels rotate at equal speeds, there is an equal driving force delivered to each wheel. When cornering, the inside wheel requires extra driving force causing slippage in the clutch cone. Consequently, the operational life of the limited slip unit is dependant upon equal rotation of both wheels during straight ahead operation. If wheel rotation for both wheels is not equal during straight ahead operation, the limited slip unit will constantly be functioning as if the

4B-6 REAR AXLE

vehicle were cornering. This will impose constant slippage on the cone and will eventually lead to abnormal wear on the cone. It is important that there are no excessive differences in the rear wheel tire sizes, air pressures, or tire wear patterns. One indication of this condition is "swerving upon acceleration." If swerving upon acceleration is encountered, check the above items before replacing the limited slip differential.

Checking Limited Slip Operation

Figure 4

Tools Required:

J 2619-01 Slide Hammer with 1/2 x 13 Adapter

J 21579 Axle Shaft Remover

1. Place transmission control lever in "Park" position, parking brake lever released.
2. Raise both rear tires off the floor.
3. Remove hub cap or wheel disc and apply J 21579, the 1/2 x 13 adapter from J 2619-01 and a torque wrench.
4. Measure torque required to rotate one wheel. The torque should be between 169 and 305 N·m (125 and 225 lb. ft.).

Figure 4 - Measuring Limited Slip Rotating Torque

5. Place transmission control lever in "Neutral" position and lower one rear tire to ground.
6. Measure torque required to rotate raised wheel. Torque should be between 60 and 136 N·m (44 and 100 lb. ft.).

The differential case must be replaced as an assembly if any of the above checks do not fall within specifications.

REAR AXLE STANDARD AND LIMITED SLIP DIAGNOSIS

CONDITION	CAUSE
Noise is the same in drive or coast.	• Road noise. • Tire noise. • Front wheel bearing noise. • Incorrect driveline angles.
Noise changes on a different type of road.	• Road noise. • Tire noise.
Noise tone lower as vehicle speed is lowered.	• Tire noise.
Noise is produced with vehicle standing and driving.	• Engine noise. • Automatic transmission noise.
Vibration.	• Rough rear axle shaft bearing. • Unbalanced or damaged propeller shaft. • Tire unbalance. • Worn universal joint in propeller shaft. • Incorrect driveline angles. • Mis-indexed propeller shaft at differential drive pinion gear yoke. • Differential drive pinion gear yoke runout too great.
A knock or click approximately every two revolutions of rear wheel.	• Rear axle shaft bearing.
Noise most pronounced on turns.	• Differential side gear and differential pinion gear noise.
A continuous low pitch whirring or scraping noise starting at relatively low speed.	• Differential drive pinion gear inner or outer bearing noise.
Drive noise, coast noise or float noise.	• Differential ring gear and drive pinion gear noise.

CONDITION	CAUSE
Clunk on acceleration or deceleration.	• Worn differential drive pinion gear shaft or differential side gear hub counterbore worn oversize. • Worn universal joint on propeller shaft. • Slip yoke lubrication insufficient.
Groan in forward or reverse.	• Wrong axle lubricant in axle.
Clunk or knock on rough road operation.	• Excessive end play of axle shafts.

INSPECTION AND DIAGNOSIS

A close examination of the differential prior to taking it apart will often reveal valuable information as to the extent and type of repairs or adjustments necessary. This information and the report of the malfunction provides a basis for determining the degree of tearing down required. Frequent causes of axle noise are improper backlash, differential drive pinion gear bearing preload, differential side bearing preload, or a combination of these items. A few simple adjustments may be all that are necessary to correct the problem.

Before removing the differential case from the housing, these items should be checked and the results recorded and analyzed: (1) backlash; (2) total differential preload; and (3) tooth contact pattern.

Use care at all times to keep dirt and other foreign matter, such as grinder dust, soot, or sand, away from the rear axle to prevent the possibility of subsequent failure.

Differential Ring Gear Tooth Nomenclature

Figure 5

The side of the gear tooth which curves outward, or is convex, is referred to as the "drive" side. The concave side is the "coast" side. The end of the tooth nearest center of the ring gear is referred to as the "toe" end. The end of the tooth farthest away from the center is the "heel" end. The toe end of the tooth is smaller than the heel end.

Tooth Contact Pattern Test

Figures 1, 2, and 6

NOTICE: It is very important that tooth contact be tested before the differential is taken apart. Variations in the differential or drive pinion gear inner bearing may cause the drive pinion gear to be too far away from, or close to, the ring gear. Thus, the tooth contact must be tested and corrected, if necessary, or the gears may be noisy.

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Clean all dirt from area of cover (14) before removing.

2. Remove housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.
3. Wipe axle lubricant out of housing (37) and carefully clean each tooth of ring gear (3).
4. Use gear marking compound GM P/N 1052351 or equivalent and apply this mixture sparingly to all ring gear teeth, using a medium stiff brush. When properly used, the area of differential drive pinion gear tooth contact will be visible when hand load is applied.

Tighten

- Bolts/screws (28) to 75 N.m (55 lb. ft.).
5. Apply parking brake lever until a torque of 54 to 70 N.m (40 to 52 lb. ft.) is required to turn drive pinion gear (16).
 - A test made without loading gears will not give a satisfactory pattern. Turn yoke (25) with a wrench so that ring gear (3) rotates one full revolution. Reverse rotation so that ring gear (3) rotates one revolution in opposite direction.
 6. Observe pattern on ring gear teeth and compare with Figure 6.
 7. Install housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.

Figure 5 - Differential Ring Gear Tooth Nomenclature

- A LOW FLANK CONTACT: DECREASE DIFFERENTIAL DRIVE PINION GEAR BEARING SHIM THICKNESS — MOVES SMALLER DIAMETER OF DIFFERENTIAL DRIVE PINION GEAR OUT TOWARD DIFFERENTIAL RING GEAR CENTER LINE
- B HEEL CONTACT: DECREASE BACKLASH — MOVES AREA OF DIFFERENTIAL DRIVE PINION GEAR CONTACT TOWARD TOE
- C HIGH FACE CONTACT: INCREASE DIFFERENTIAL DRIVE PINION GEAR BEARING SHIM THICKNESS — MOVES LARGER DIAMETER OF DIFFERENTIAL DRIVE PINION GEAR IN TOWARD CENTER OF DIFFERENTIAL RING GEAR
- D TOE CONTACT: INCREASE BACKLASH — MOVES AREA OF DIFFERENTIAL DRIVE PINION GEAR CONTACT TOWARD HEEL
- E DESIRED PATTERN: IN CENTER OF DIFFERENTIAL RING GEAR TOOTH

Figure 6 - Differential Ring Gear Tooth Contact Pattern (Drive Side) Diagnosis Chart

Effects of Increasing Load on Tooth Contact Pattern

When the "load" on the ring gear and drive pinion gear is increased, such as when the vehicle is accelerated forward from stand still or from normal drive, the tooth contact will tend to spread out, and under very heavy load, will extend from near toe to near heel on the drive side. The entire contact also tends to shift toward the heel under increasingly heavier loads and will become somewhat broader with respect to tops and bottoms of teeth. The patterns obtained by this tooth contact pattern test approximate a light load and, for this reason, they will extend only about halfway.

The important thing to note is that the contact pattern is centrally located up and down on the face of the differential ring gear teeth.

Insufficiently preloaded drive pinion gear and differential bearings will also cause a change in tooth contact pattern under load.

Adjustments Affecting Tooth Contact

Figure 7

Two adjustments can be made which will affect the tooth contact pattern: backlash and position of drive pinion gear (16) in the housing. The effects of bearing preloads are not readily apparent on hand-loaded tooth contact pattern tests.

Backlash is adjusted by means of shims (1). They move the entire differential closer to, or farther from, drive pinion gear (16). Shims (1) are also used to set differential bearing preload. If the thickness of the right shim (1) is increased, along with decreasing the left shim (1) thickness, backlash will increase. The backlash will decrease if the left shim (1) thickness is increased, along with a decrease in the right shim (1) thickness.

The position of drive pinion gear (16) is adjusted by increasing or decreasing the drive pinion gear bearing shim thickness between the drive pinion gear head and race of the drive pinion gear inner bearing. Shim (17) is used in the axle to compensate for manufacturing tolerances. Increasing thickness moves drive pinion gear (16) closer to the centerline of ring gear (3). Decreasing thickness moves drive pinion gear (16) farther away from the centerline of ring gear (3).

Effects of Differential Drive Pinion Gear Position on Tooth Pattern

Figure 8

When the drive pinion gear is too far away from the centerline of the ring gear, the pattern will be a high heel contact on the drive side and high toe contact on the coast side. Moving the drive pinion gear closer to the centerline of the ring gear by decreasing backlash will cause the high heel contact on the drive side to lower and move toward the toe; the high toe contact on the coast side will lower and move toward the heel.

When the drive pinion gear is too close to the centerline of the ring gear, the pattern will be a low toe contact on the drive side, and a low heel contact on the coast side. Moving the drive pinion gear farther away from the ring gear by increasing backlash will cause low toe contact on the drive side to raise and move toward the heel; the low heel contact on the coast side will raise and move toward the toe.

ON-VEHICLE SERVICE

Before attempting any service procedures the technician must know what type rear axle is to be serviced. Refer to "Rear Axle Usage Chart" in this section to identify codes, differential ring gear size, and ratios. Also, refer to the service parts identification label on the vehicle.

Most axle service repairs can be made by supporting the vehicle by the frame with the housing supported and lowered to its lowest travel. On some vehicles it may be necessary to disconnect rear shock absorbers to obtain additional clearance. When doing this, do not allow the rear brake hose to become kinked or stretched.

Axle lubricant may be drained by removing all housing cover bolts/screws and breaking the cover loose at the bottom.

If the housing is removed for any reason, axle service can be performed on the bench.

Figure 7 - Tooth Contact Adjustments

4B-10 REAR AXLE

When a new ring gear and drive pinion gear are installed, the owner should be advised not to accelerate rapidly or exceed 80 km/h (50 mph) for the first 80 km (50 miles) of driving.

REAR AXLE LUBRICANT FILL AND CHECK

Figures 1 and 2

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Raise and suitably support vehicle. Refer to SECTION 0A.
 - Keep vehicle level.
2. Clean dirt or foreign material from around plug opening before removing plug (21).
3. Remove plug (21).
4. Maintain axle lubricant level from flush with the bottom of plug opening to no lower than 15 mm (9/16 inch) below plug opening.
5. Add or replace axle lubricant using GM P/N 1052271, or equivalent.
 - If limited slip differential, add rear axle friction modifier lubricant additive GM P/N 1052358, or equivalent.
6. Install plug (21) and tighten to 35 N.m (26 lb. ft.).
7. Lower vehicle.

REAR AXLE FLUSHING PROCEDURE

Figure 1

The rear axle flushing procedure should be performed if any small metal particles or chips are noticed in the rear axle lubricant or to remove varnish deposits on high mileage vehicles. If large metal particles are noticed, determine the cause and correct.

Remove or Disconnect

1. Rear axle housing cover and gasket. Refer to "Rear Axle Housing Cover and Gasket" in this section.
2. With vehicle in neutral, rotate propeller shaft until differential case window is facing down.

Clean

1. Using a medium size can of brake cleaner solvent and spray the following components:
 - Inside of rear axle housing.
 - Differential case.
 - Differential ring gear and drive pinion gear.
 - Differential side gears.
 - Differential pinion gears.
2. Continue to spray the above components while rotating the propeller shaft to ensure entire differential ring gear and drive pinion gear is sprayed with solvent.
3. Inside of rear axle housing cover.

- A DIFFERENTIAL DRIVE PINION GEAR TOO FAR AWAY FROM DIFFERENTIAL RING GEAR (INSUFFICIENT DIFFERENTIAL BEARING SHIM THICKNESS)
- B EFFECT ON PATTERN AS DIFFERENTIAL BEARING SHIM THICKNESS IS INCREASED
- C DIFFERENTIAL DRIVE PINION GEAR TOO CLOSE TO DIFFERENTIAL RING GEAR (EXCESSIVE DIFFERENTIAL BEARING SHIM THICKNESS)
- D EFFECT ON PATTERN AS DIFFERENTIAL BEARING SHIM THICKNESS IS DECREASED

- E TOE
- F HEEL, COAST SIDE (CONCAVE)
- G HEEL, DRIVE SIDE (CONVEX)

Figure 8 - Differential Bearing Shim Thickness Effect On Tooth Pattern

4. Remove rear wheel speed sensor. Clean any foreign matter from sensor face. If sensor body or tip shows any evidence of damage, replace it. Refer to SECTION 5E1.

Install or Connect

- Rear axle housing cover and gasket. Refer to "Rear Axle Housing Cover and Gasket" in this section.

REAR AXLE HOUSING COVER AND GASKET

Figures 1 and 2

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (13) and pry cover (14) loose.

Clean

- All dirt from area of cover (14).
3. Cover (14).
 4. Drain axle lubricant.
 5. Gasket (15).
 - Clean both gasket sealing surfaces.

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Cover (14) and new gasket (15).
2. Bolts/screws (13).

Tighten

- Bolts/screws (13) in a crosswise pattern to 30 N.m (22 lb. ft.).
3. Add axle lubricant. Refer to "Rear Axle Lubricant Fill and Check" in this section.
 4. Lower vehicle.

REAR AXLE SHAFT

Figures 1, 2, and 9

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Rear tire and wheels. Refer to SECTION 3E.
3. Rear brake drums, on vehicles equipped with rear drum brake systems. Refer to SECTION 5C2.
4. Rotor and rear parking brake shoe lining, on vehicles equipped with rear disc brake systems. Refer to SECTION 5B2.
5. Housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.

6. Bolt/screw (5) from case (7).
7. Pinion gear shaft (6) from case (7).
8. Shaft lock (38).
- Access by pushing the flanged end of shaft (39) into housing (37).
9. Axle Shaft (39) from housing (37), being careful not to damage seal (34) or sensor (49) and sensor ring.
- Hold a shop towel under axle shaft (39) while pulling out to prevent axle lubricant from contaminating brake shoes and linings.

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Shaft (39) into place taking care that splines on the end of shaft (39) do not damage seal (34) and that they engage with the splines of side gear (10).
- The 30-spline, 8 1/2-inch ring gear rear axle shaft is not interchangeable with any pre-1989 shaft.
2. Shaft lock (38).
- Push axle shaft (39) outward so that shaft lock (38) seats in counterbore of side gear (10).

Figure 9 - Internal View of Rear Axle Housing (Non-Limited Slip)

4B-12 REAR AXLE

3. Pinion gear shaft (6) through case (7), thrust washers (11) and pinion gears (12), aligning the hole in shaft (6) with the shaft lock bolt/screw hole.
4. Bolt/screw (5).
 - Coat threads with Loctite® 242 (GM P/N 12345382) or equivalent.

Tighten

- Bolt/screw (5) to 36 N.m (27 lb. ft.).
5. Housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.
 6. Rear brake drum. Refer to SECTION 5C2.
 7. Rotor and rear parking brake shoe and linings, if removed. Refer to SECTION 5B2.
 8. Rear tire and wheels. Refer to SECTION 3E.
 9. Lower vehicle.

REAR AXLE SHAFT BEARING AND/OR BEARING SEAL

Figures 10 through 13

Tools Required:

- J 2619-01 Slide Hammer with 1/2 x 13 Adapter
- J 8092 Driver Handle
- J 22813-01 Axle Shaft Bearing Remover, 7 5/8 & 8 1/2-Inch Ring Gear (B Sedans)
- J 23689 Axle Shaft Bearing Remover, 8 1/2-Inch Ring Gear (B Wagons)

Figure 10 - Rear Axle Shaft

2. Bearing (35) so that tool bottoms against shoulder in housing (37), using J 23765 or J 23690 and J 8092.
3. Lubricate sealing lips with gear lubricant. Use GM P/N 1052271, or equivalent.
4. Position seal (34) on J 23771 or J 21128 and direct seal (34) into housing bore.
5. Seal (34) into place, flush with the axle tube.
6. Rear disc brake mounting plate, if removed. Refer to SECTION 5B2.
7. Rear drum brake backing plate, if removed. Refer to SECTION 5C2.
8. Rear Axle shaft. Refer to "Rear Axle Shaft" in this section.

DIFFERENTIAL DRIVE PINION GEAR YOE AND SEAL

Figures 1, 2, and 14 through 17

Tools Required:

- J 8614-01 Pinion Flange Remover Set
- J 23911 Pinion Oil Seal Installer, 7 5/8-Inch Ring Gear
- J 22388 Pinion Oil Seal Installer, 8 1/2-Inch Ring Gear

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Both rear tire and wheels. Refer to SECTION 3E.
3. Rear brake drums, on vehicles equipped with rear drum brake systems. Refer to SECTION 5C2.
4. Rotor and rear parking brake shoe and lining, on vehicles equipped with rear disc brake system. Refer to SECTION 5B2.
5. Mark propeller shaft and yoke (25) so they can be assembled in same position.
6. Propeller shaft from yoke (25).
 - A. Remove four propeller shaft bolts/screws and two propeller shaft retainers attaching propeller shaft to yoke (25).

- B. Support propeller shaft up in body tunnel by wiring propeller shaft to the exhaust muffler.
 - If universal joint bearings are not retained by a retainer strap, use a piece of tape to hold universal joint bearings on their journals.
7. Mark position of yoke (25), drive pinion gear (16) and nut (27) so proper drive pinion gear inner and outer bearing preload can be maintained.
8. Check preload with a pound-inch torque wrench and record. This will give combined drive pinion gear inner and outer bearing, axle shaft bearing and differential bearing preload.
9. Nut (27), washer (26), and yoke (25) using J 8614-01.
 - Use a suitable container to hold any lubricant that may drain from axle.
10. Seal (24) by driving it out of housing (37) with a blunt chisel. Do not damage housing (37).

Inspect

- Differential drive pinion gear seal surface of yoke (25) for tool marks, nicks, or damage, such as a groove worn by seal (24). If damaged, replace yoke (25).

Figure 11 - Removing Rear Axle Shaft Bearing

Figure 12 - Installing Rear Axle Shaft Bearing

Figure 13 - Installing Rear Axle Shaft Bearing Seal

4B-14 REAR AXLE

- Housing bore and remove any burrs that might cause leaks around the outer diameter (OD) of seal (24).

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Seal (24), using J 23911 or J 22388.
2. Apply seal lubricant, GM P/N 1050169 or equivalent, to OD of yoke (25) and sealing lip of new seal (24).
3. Yoke (25).
4. Washer (26) and nut (27) finger tight.
5. While holding yoke (25), using J 8614-01, tighten nut (27) gradually and turn drive pinion gear (16) several revolutions after each tightening to set

Figure 14 - Checking Differential Drive Pinion Gear Preload

Figure 15 - Removing Differential Drive Pinion Gear Nut

bearings. Check preload of bearings each time with a pound-inch torque wrench until preload is 0.3 N.m to 0.6 N.m (3 lb. in. to 5 lb. in.) more than reading obtained in removal procedure.

6. Propeller shaft to yoke (25).

- Install two propeller shaft retainers and four propeller shaft bolts/screws attaching propeller shaft to yoke (25).

Tighten

- Propeller shaft bolts/screws to 22 N.m (16 lb. ft.).
7. Rear brake drums, if removed. Refer to SECTION 5C2.
 8. Rotor and rear parking brake shoe and lining, if removed. Refer to SECTION 5B2.
 9. Tire and wheels. Refer to SECTION 3E.
 10. Lubricant. Refer to "Rear Axle Lubricant Fill and Check" in this section.
 11. Lower vehicle.

Inspect

- Operation of axle.

Figure 16 - Removing Differential Drive Pinion Gear Yoke

Figure 17 - Installing Differential Drive Pinion Gear Seal

REAR AXLE HOUSING REPLACEMENT

Figures 1 and 2

It is not necessary to remove the rear axle housing for any normal repairs. However, if the rear axle housing is damaged, it may be removed and installed using the following procedure.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Support front end of vehicle with an adjustable lifting device.
3. Support housing (37) with an adjustable lifting device.
4. Rear wheel speed sensor. Refer to SECTION 5E1.
5. Automatic level control sensor link, if equipped. Refer to SECTION 5E1.
6. Propeller shaft. Refer to SECTION 4A.
7. Rear wheels and tires. Refer to SECTION 3E.
8. Rear brake pipes from rear brake hose fitting.
 - Be careful not to bend brake pipes.
 - Plug brake pipes and brake hose fittings to prevent loss of fluid and entrance of dirt.
9. Parking brake cables from equalizer and frame. Refer to SECTION 5F.
10. Bolt/screw attaching rear brake hose fitting to housing (37).
11. Rear brake pipe hose fitting from housing (37).
12. Rear brake pipe fittings from rear wheel cylinders on vehicles equipped with rear drum brake systems, if replacing housing (37).
13. Rear brake pipe fittings from rear brake hoses on vehicles equipped with rear disc brake systems, if replacing housing.
 - Plug brake pipe and brake hoses to prevent loss of brake fluid and entrance of dirt.
14. Rear brake pipes from housing (37), if replacing housing (37).
 - Disengage brake pipes from clips.
15. Rear springs. Refer to SECTION 3D.
16. Upper and lower control arms from rear axle housing. Refer to SECTION 3D.
 - Use a helper to stabilize housing (37).
17. Rear axle from hoist, with the aid of a helper.
18. Rear brake drums on vehicles equipped with rear drum brake systems, if replacing rear axle housing. Refer to SECTION 5C2.
19. Rotor and rear parking brake shoe and lining on vehicles equipped with rear disc brake systems, if replacing rear axle housing. Refer to SECTION 5B2.

20. Rear axle shaft, if replacing rear axle housing. Refer to SECTION 5C2.
21. Rear brake backing plate with parking brake cables attached on vehicles with rear drum brake systems, if replacing rear axle housing. Refer to SECTION 5C2.
22. Rear brake mounting plate on vehicles equipped with rear disc brake system, if replacing rear axle housing. Refer to SECTION 5B2.
23. Differential drive pinion gear, if replacing rear axle housing. Refer to "Differential Drive Pinion Gear" in this section.

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Determine differential side bearing preload. Refer to "Differential Side Bearing Preload Adjustment" under "Unit Repair" in this section.
2. Drive pinion gear (16), if removed.
3. Rear brake mounting plate, if removed. Refer to SECTION 5B2.
4. Rear brake backing plate with parking brake cables attached, if removed. Refer to SECTION 5C2.
5. Rear axle shaft, if removed. Refer to "Rear Axle Shaft" in this section.
6. Rear brake drums, if removed. Refer to SECTION 5C2.
7. Rotor and rear parking brake shoe and lining, if removed. Refer to SECTION 5B2.
8. Rear axle to hoist, with the aid of a helper.
9. Lower and upper control arms. Refer to SECTION 3D.
10. Rear springs. Refer to SECTION 3D.
11. Rear brake pipes to housing (37), if housing (37) was replaced.
 - Engage brake pipes into clips or install straps.
12. Rear brake pipe fittings to rear brake hoses, if removed.

Tighten

- Rear brake pipe-to-rear brake hose fittings to 24 N·m (18 lb. ft.).
13. Rear brake pipe fittings to 24 N·m (18 lb. ft.).

Tighten

- Rear brake pipe fittings to 24 N·m (18 lb. ft.).
14. Rear brake hose fitting to housing (37).
 15. Bolt/screw to 27 N·m (20 lb. ft.).

Tighten

- Bolt/screw to 27 N·m (20 lb. ft.).
16. Parking brake cables to frame and equalizer. Refer to SECTION 5F.

4B-16 REAR AXLE

17. Rear brake pipes to rear brake hose fitting.
 - Unplug brake pipes and brake hose fittings.

Tighten

- Rear brake pipe-to-rear brake hose fitting to 24 N.m (18 lb. ft.).
18. Rear wheels and tires. Refer to SECTION 3E.
 19. Propeller shaft. Refer to SECTION 4A.
 20. Automatic level control sensor link, if equipped. Refer to SECTION 3D1.
 21. Rear wheel speed sensor. Refer to SECTION 5E1.
 22. Remove support from housing (37).
 23. Remove support from front end of vehicle.
 24. Bleed brake hydraulic system. Refer to SECTION 5.
 25. Adjust parking brake cable, if necessary. Refer to SECTION 5F.
 26. Lower vehicle.

WHEEL BOLT

Figures 1, 2, 18 and 19

Tool Required:

J 6627-A Wheel Stud Remover

When replacing rear wheel bolts (hub studs), use the following guide:

- Stripped bolt(s) - Replace the bolt(s) involved.
- One loose bolt - Replace all bolts.
- One broken bolt - Replace all bolts.
- Wheel bolt hole elongated - Replace rear axle shaft.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Rear tire and wheel. Refer to SECTION 3E.
3. Mark relationship of drum (42) or rotor (53) to axle shaft flange.
4. Rear brake drum on vehicles equipped with rear drum brake system. Refer to SECTION 5C2.
5. Rotor and rear parking brake shoe and lining, on vehicles equipped with rear disc brake system. Refer to SECTION 5B2.
6. Wheel bolt (40) from rear axle shaft flange using J 6627-A.

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Wheel bolt (40), four washers and wheel nut (43) to rear axle shaft flange.
2. Wheel nut (43) until wheel bolt (40) is completely seated against rear axle shaft flange.
3. Remove wheel nut (43) and four washers.

4. Rotor and rear parking brake shoe and lining, if removed. Refer to SECTION 5B2.
5. Rear brake drum, if removed. Refer to SECTION 5C2.
6. Rear tire and wheel. Refer to SECTION 3E.
7. Lower vehicle.

UNIT REPAIR

Important

- The driveline components in this vehicle have been factory system balanced. System balance provides a smoother running driveline operation. However, it is essential that the positions of all driveline components relative to the propeller shaft and rear axle be observed and **ACCURATELY REFERENCE MARKED PRIOR TO DISASSEMBLY**. These components include the propeller shafts, rear axles, differential drive pinion gear yoke, output shaft, etc. **ALL COMPONENTS MUST BE REASSEMBLED IN THE EXACT RELATIONSHIP TO EACH**

Figure 18 - Removing Wheel Bolt

Figure 19 - Installing Wheel Bolt

OTHER AS THEY WERE WHEN REMOVED.

Additionally, the published specifications and torque values, as well as any measurements made prior to disassembly must be followed to maintain the factory balance.

When a new ring gear and drive pinion gear is installed, the original drive pinion gear yoke should be replaced with a service drive pinion gear yoke. The owner should be advised not to accelerate rapidly or exceed 80 km/h (50 mph) for the first 80 km (50 miles) of driving.

Any time the differential is taken apart for service, the following cleaning and inspecting procedures should be followed:

Clean

- All differential bearings thoroughly in clean solvent.

Inspect

- Bearings visually and by feel. Bearings should feel smooth when oiled and rotated while applying as much hand pressure as possible. Minute scratches and pits that appear on rollers and races at low mileage are due to the initial preload, and bearings having these marks should not be replaced.
- Sealing surface of drive pinion gear yoke for nicks, burrs, or rough tool marks which would cause damage to the drive pinion gear seal and result in an axle lubricant leak. Replace if damaged.
- Housing bore and remove any burrs that might cause leaks around the OD of the drive pinion gear seal.
- Ring gear and drive pinion gear teeth for excessive wear and scoring. If any of these conditions exist, replacement of the gears as a set will be required.
- Differential pinion gear shaft for unusual wear. Also, check the differential pinion and side gears and differential pinion gear thrust washers.
- Press fit of the differential bearing inner race on the differential case hub by prying against the shoulder at the puller recess in the case. Differential bearings must be press fit on the hub.
- Rear axle failures such as chipped bearings, loose (lapped-in) bearings, chipped gears, etc. are indications that foreign material is present. The housing must be cleaned.

DIFFERENTIAL CASE

Figures 1, 2, and 20 through 25

Tools Required:

- J 8092 Driver Handle
- J 25588 Side Bearing Shim Installer
- J 21465-13 Driver Handle Extension
- J 22888-20A Differential Side Bearing Remover
- J 8107-2 Differential Side Bearing Remover Plug, 7 5/8-Inch Ring Gear
- J 8107-4 Differential Side Bearing Remover Plug, 8 1/2-Inch Ring Gear
- J 22761 Differential Side Bearing Installer, 8 1/2-Inch Ring Gear
- J 25299 Differential Side Bearing Installer, 7 5/8-Inch Ring Gear

Figure 20 - Removing Differential Case

Figure 21 - Removing Differential Bearing

4B-18 REAR AXLE

Remove or Disconnect

Important

- Before removing case (7) from housing (37), differential ring gear-to-differential drive pinion gear backlash must be checked. Refer to "Differential Ring Gear-to-Differential Drive Pinion Gear Backlash" in this section. This will indicate gear or bearing wear or an error in backlash or preload setting which will help in determining the cause of rear axle noise.

1. Axle shafts. Refer to "Rear Axle Shaft" in this section.
2. Bolts/screws (28).

Important

- Bearing caps (29) should be marked "R" and "L" to make sure they will be assembled in their original location.
 - Place right and left bearing outer races of bearings (4) and shims (1) in sets with marked caps (29) so that they can be reinstalled in their original positions.
3. Shims (1).

NOTICE: Exercise caution in prying on housing so cover gasket sealing surface is not damaged.

4. Case (7) from housing (37).

Disassemble

Figures 1, 2 and 21

1. Bearing (4) from case (7), if replacing, using J 22888-20 and J 8107-4 or J 8107-2.
2. Pinion gears (12), thrust washers (11), side gears (10) and thrust washers (9) from case (7).
 - Mark side gears (10) and case (7) so side gears (10) can be reinstalled in their original position.
3. All bolts/screws (8) from case (7), if replacing ring gear (3).
 - Bolts/screws (8) are left-hand thread type.
 - Discard bolts/screws (8).
4. Ring gear (3) from case (7).
 - Do not pry between ring gear (3) and case (7), if ring gear (3) is on tight.
 - Drive ring gear (3) from case (7) using a brass drift and hammer.

Figure 22 - Differential Ring Gear-to-Differential Case

Figure 23 - Installing Differential Bearing

Figure 24 - Installing Differential Bearing Shim

Assemble

Figures 1, 2, and 26

NOTICE: Refer to "Notice" on page 4B-1 of this section.

Important

- Before assembling the differential, lubricate all parts with axle lubricant GM P/N 1052271, or equivalent.

Clean

- Connecting surfaces of ring gear (3) and case (7), if replacing ring gear (3).

Adjust

- Differential bearing preload adjustment. Refer to "Differential Bearing Preload Adjustment" in this section.

1. Ring gear (3) to case (7), if removed.
2. Two new bolts/screws (8) into opposite sides of ring gear (3) on case (7). If converting to an Auburn type limited slip rear axle, skip step 3.
 - Install remaining new bolts/screws (8) to case (7) until just snug.

Tighten

- New bolts/screws (8) alternately in progressive stages to 120 N·m (89 lb. ft.).
3. Thrust washers (9), side gears (10), pinion gears (12) and thrust washers (11) into case (7).
 - A. Thrust washers (9) over gear hubs and install side gears (10) in case (7). If same parts are reused, install in original sides. If side gears (10) are replaced, pre-1989 gears are not interchangeable.
 - B. Position one pinion gear (12) (without washer) between side gears (10) and rotate side gears (10) until pinion gear (12) is directly opposite loading opening in case (7). Place other pinion gear (12) between side gears (10) so that pinion gear shaft holes are in line; then rotate gears, lining up holes in pinion gears (12) with holes in case (7).
 - C. Rotate pinion gears (12) back toward loading opening just enough to permit sliding in thrust washers (11).
 4. Bearings (4) to case (7), if removed, using J 8092 and J 22761 or J 25299.

Install or Connect

Figures 1, 2 and 24

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. Case (7) into housing (37).

2. Shims (1) as determined during differential bearing preload adjustment.

- It will be necessary to drive the right differential bearing shim into position using J 25588.

Important

- Do not attempt to reinstall the production shims (1) as they may break when tapped into place.
- If service shims were previously installed, they can be reused, but whether using new or old bearings, adhere to the following procedure in all cases. If bearings are used again, they must have original outer races in place. Refer to "Differential Side Bearing Preload Adjustment" in this section.
- Keep ship packs in their respective position, right or left side.
- Select a shim 0.10 mm (0.004 inch) thicker than the one removed from the left side, then insert left side shim pack between the spacer and the left bearing race.
- Loosely install bearing cap (29).
- Select a shim 0.10 mm (0.004 inch) thicker than the one removed from the right side and insert between the spacer and the right bearing race.
- It will be necessary to drive the right shim into position using J 25588.

3. Bolts/screws (28).

Tighten

- Bolts/screws (28) to 75 N·m (55 lb. ft.).
4. Check backlash and correct if necessary. Refer to "Differential Ring Gear-to-Differential Drive Pinion Gear Backlash" in this section.
 5. Rear axle shafts. Refer to "Rear Axle Shaft" in this section.

DIFFERENTIAL RING GEAR-TO-DIFFERENTIAL DRIVE PINION GEAR BACKLASH

Figures 1, 2 and 25

Tool Required:
J 8001 Dial Indicator Set

Remove or Disconnect

- Housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.

Measure

1. Rotate case (7) several times to seat bearings. Mount J 8001.
 - Use small button on indicator stem so that contact can be made near heel end of tooth.
 - Set J 8001 so that stem is in line with gear rotation and perpendicular to tooth angle for accurate backlash reading.

4B-20 REAR AXLE

2. Check backlash at three or four points around ring gear (3).

- Lash must not vary over 0.05 mm (0.002 in.) around ring gear (3).
- Drive pinion gear must be held stationary when checking backlash.

! Important

- If variation is over 0.05 mm (0.002 in.), check for burrs, uneven bolting conditions or distorted differential case flange and make corrections as necessary.

🔑 Adjust

1. Backlash at point of minimum lash should be between 0.13 mm and 0.20 mm (0.005 in. and 0.008 in.) for all new gears.
2. Backlash by increasing thickness of one shim (1) and decreasing thickness of other shim (1) the same amount.
 - For each 0.03 mm (0.001 in.) change in backlash desired, transfer 0.05 mm (0.002 in.) in differential bearing shim thickness.
 - To decrease backlash 0.03 mm (0.001 in.), decrease thickness of right shim (1) 0.05 mm (0.002 in.) and increase thickness of left shim (1) 0.05 mm (0.002 in.). To increase backlash 0.05 mm (0.002 in.), increase thickness of right shim (1) 0.10 mm (0.004 in.) and decrease thickness of left shim (1) 0.10 mm (0.004 in.).
 - Refer to "Differential Bearing Preload Adjustment" in this section for further information.

↔ Install or Connect

- Housing cover. Refer to "Rear Axle Housing Cover and Gasket" in this section.

Figure 25 - Checking Differential Ring Gear-to-Differential Drive Pinion Gear Backlash

DIFFERENTIAL SIDE BEARING PRELOAD ADJUSTMENT

Figures 1 and 2

The differential bearing preload adjustment is to be made before installing drive pinion gear (16). If drive pinion gear (16) is installed, remove ring gear (3). Refer to "Differential Case" in this section.

Differential bearing preload is adjusted by changing the thickness of both the right and left shims (1) by an equal amount.

By changing the thickness of both shims (1) equally, the original backlash will be maintained.

Production shims (1) are cast iron and vary in thickness from 5.33 mm to 6.91 mm (0.210 in. to 0.272 in.) in increments of 0.05 mm (0.002 in.).

Standard service spacers (2) are 4.32 mm (0.170 in.) thick and steel service differential bearing shims (1) are available from 1.02 mm to 2.08 mm (0.040 in. to 0.082 in.) in increments of 0.05 mm (0.002 in.).

! Important

- If service shims (1) were previously installed, they can be reused, but whether using new or old bearings (4), adhere to the following procedure in all cases. If bearings (4), are used again, they must have original outer races in place.
1. Determine the approximate thickness of shims (1) needed by measuring each production shim (1) or each service spacer (2) and differential bearing shim pack.
 - In addition to service spacer (2), service shims (1) will be needed. Select a starting point in service differential bearing shim thickness.
 2. Place case (7) with differential bearing outer races in position in housing (37).
 3. Slip spacer (2) between each differential bearing race and housing (37) with chamfered edge against housing (37).

NOTICE: Install the left differential bearing cap loosely so that the differential case may be moved while checking adjustments. Another differential bearing cap bolt/screw can be added in the lower right differential bearing cap hole. This will prevent the differential case from dropping while making differential bearing shim adjustments.

4. Select one or two shims (1) totaling the amount shown in right-hand column of Figure 29 and position between the right differential bearing race and spacer (2).
 - Be sure the left differential bearing race and spacer (2) are against left side of housing (37).
5. Rotate case (7) while using feeler gage to assure an even reading.
 - The original light drag is caused by weight of case (7) against housing (37) while additional drag is caused by differential bearing preload.

- By starting with a thin feeler gage, a sense of "feel" is obtained so the beginning of preload can be recognized to obtain zero clearance.
 - It will be necessary to work case (7) in and out and to the left in order to insert feeler gage.
6. Remove left cap (29) and shim (1) from housing (37).
 7. The total differential bearing shim pack needed (with no preload on differential bearings) is the feeler gage reading found in step 5 plus the thickness of differential bearing shims installed in step 4.
 8. Select two shims (1) of approximately equal size whose total thickness is equal to the value obtained in step 7.
 - These shims (1) will be installed between each differential bearing race and service spacer (2) when case (7) is installed in housing (37).
 - The preload will not be added until case (7) is installed.
 9. If drive pinion gear (16) is in position, install ring gear (3). Refer to "Differential Case" in this section.

4.32 mm (0.170") SERVICE DIFFERENTIAL BEARING SPACER	
TOTAL THICKNESS OF BOTH PRODUCTION DIFFERENTIAL BEARING SHIMS REMOVED	TOTAL THICKNESS OF SERVICE DIFFERENTIAL BEARING SHIMS TO BE USED AS A STARTING POINT
10.57 mm (0.416")	1.52 mm (0.060")
10.92 mm (0.430")	1.78 mm (0.070")
11.18 mm (0.440")	2.03 mm (0.080")
11.43 mm (0.450")	2.29 mm (0.090")

13.97 mm (0.550")	4.83 mm (0.190")

T5607

DIFFERENTIAL DRIVE PINION GEAR

Figures 1 and 2

Tool Required:
Deadblow hammer or weighted rubber mallet.

Remove or Disconnect

1. Differential case. Refer to "Differential Case" in this section.
2. Check differential drive pinion gear inner and outer bearing preload. If there is no preload reading, check for looseness of drive pinion gear (16) by shaking. Looseness could be caused by

defective bearings or worn yoke (25). If the rear axle was operated for an extended period with very loose differential drive pinion gear inner and outer bearings, ring gear (3) and drive pinion gear (16) will also require replacement.

3. Differential drive pinion gear yoke. Refer to "Differential Drive Pinion Gear Yoke and Seal" in this section.
4. Drive pinion gear (16) from front pinion bearing and housing, using deadblow hammer or weighted mallet. Apply heavy hand pressure on pinion remover toward housing (37) to keep outer bearing (23) seated to avoid damage to outer race.

Install or Connect

1. If installing new differential ring gear and differential drive pinion gear, measure differential drive pinion gear depth. Refer to "Differential Drive Pinion Gear Depth" in this section.
2. Drive pinion gear (16) into housing (37).
3. Differential drive pinion gear yoke. Refer to "Differential Drive Pinion Gear Yoke and Seal" in this section.
 - A. Hold yoke (25).
 - B. While intermittently rotating drive pinion gear (16) to seat inner and outer bearings (18 and 23), tighten nut (27) until end play begins to be taken up.

Important

- When no further end play is detectable and when holder will no longer pivot freely as drive pinion gear (16) is rotated, preload specifications are being approached.
 - No further tightening should be attempted until the preload has been checked.
 - After preload has been checked, final tightening should be done very carefully.
 - Additional tightening of nut (27) can add many additional pound-inches of torque.
 - Nut (27) should be further tightened only slightly and the preload should be checked after each tightening.
 - Exceeding preload specifications will compress the collapsible spacer (22) too far and require the installation of a new spacer (22).
4. Set preload at 1.7 N·m to 3.4 N·m (15 lb. in. to 30 lb. in.) for 7 5/8 inch ring gear on new bearings or 2.0 N·m to 4.1 N·m (18 lb. in. to 36 lb. in.) for 8 1/2 inch ring gear on new inner and outer bearings (18 and 23) or 1.1 N·m to 1.7 N·m (10 lb. in. to 15 lb. in.) on used ones.
 5. Rotate drive pinion gear (16) several times to assure that inner and outer bearings (18 and 23) have been seated.
 - A. Check preload again.
 - B. If preload has been reduced by rotating drive pinion gear (16), reset preload to specifications.
 6. Differential case. Refer to "Differential Case" in this section.

4B-22 REAR AXLE

Differential Drive Pinion Gear Outer Bearing

Figures 1, 2 and 26

Tools Required:

- J 8092 Driver Handle
- J 7817 Front Pinion Bearing Cup Installer,
7 5/8 Inch Ring Gear
- J 8611-01 Front Pinion Bearing Cup Installer,
8 1/2 Inch Ring Gear

Remove or Disconnect

1. Differential drive pinion gear from rear axle housing. Refer to "Differential Drive Pinion Gear" in this section.
2. Differential drive pinion gear seal from rear axle housing. Refer to "Differential Drive Pinion Gear Yoke and Seal" in this section.
3. Outer bearing (23) from housing (37).
4. Outer bearing race from housing (37), if replacing outer bearing (23).
 - Drive race from housing (37), using a punch in slots provided for this purpose.

Install or Connect

1. Outer bearing race into housing (37), if removed, using J 8092 and J 8611-01 or J 7817.
2. Outer bearing (23) into housing (37).
3. Differential drive pinion gear seal. Refer to "Differential Drive Pinion Gear Yoke and Seal" in this section.
4. Differential drive pinion gear. Refer to "Differential Drive Pinion Gear" in this section.

Rear Axle Speed Sensor Ring

Refer to "Differential Drive Pinion Gear Inner Bearing" below, for removal and installation procedures.

Differential Drive Pinion Gear Inner Bearing

Figures 1, 2 and 27 through 31

Tools Required:

- J 8092 Driver Handle
- J 22912-01 Universal Bearing Puller
- J 21493-B Rear Pinion Bearing Cone Remover, 7 5/8 Inch Ring Gear
- J 8612-B Rear Pinion Bearing Cone Remover, 8 1/2 Inch Ring Gear
- J 5590 Rear Pinion Bearing Cone Installer, 7 5/8 Inch Ring Gear
- J 35512 Rear Pinion Bearing Cone Installer, 8 1/2 Inch Ring Gear
- J 29609 Rear Pinion Bearing Cup Installer, 7 5/8 Inch Ring Gear
- J 8608 Rear Pinion Bearing Cup Installer, 8 1/2 Inch Rear Axle

Figure 26 - Installing Differential Drive Pinion Gear Outer Bearing Race

Figure 27 - Removing Rear Axle Speed Sensor Ring

Remove or Disconnect

1. Differential drive pinion gear. Refer to "Differential Drive Pinion Gear" in this section.
2. Spacer (22) from drive pinion gear (16).
 - Discard spacer (22).
3. Sensor ring (19) from drive pinion gear (16).
 - A. Use flat side of J 22912-01 facing sensor ring (19).
 - B. Discard sensor ring (19).
4. Drive pinion gear inner bearing race from housing (37), if replacing inner bearing (18).
 - Drive race from housing (37) using a punch in slots provided for this purpose.
5. Separate inner pinion bearing (18) from drive pinion gear (16).

Figure 28 - Removing Differential Drive Pinion Gear Inner Bearing

- Use J 22912-01 (Universal) or J 8612-B (8 1/2 inch ring gear) or J 21493-B (7 5/8 inch ring gear).

Install or Connect

1. Inner bearing (18) onto drive pinion gear (16).
 - Use J 35512 or J 5590.
2. Inner bearing race into housing (37), if inner bearing (18) was replaced.
 - Use J 8092 and J 8608 or J 29609.

CAUTION: Once the rear wheel speed sensor ring has been removed from the differential drive pinion gear, a new rear speed sensor ring must be installed. The press fit may be lost if the rear speed sensor is used more than once. This would allow the rear speed sensor ring to rotate freely on the differential drive pinion gear shaft causing a significant reduction in performance of the antilock brake system, which could result in bodily injury.

3. New sensor ring (19) onto drive pinion gear (16).
 - Flat side of J 22912-01 faces sensor ring (19).
4. New spacer (22) onto drive pinion gear (16).
5. Differential drive pinion gear. Refer to "Differential Drive Pinion Gear" in this section.

DIFFERENTIAL DRIVE PINION GEAR DEPTH

Figures 1, 2, 32 and 33

Tools Required (7 5/8-Inch Ring Gear):

- J 8001 Dial Indicator Set
- J 23597-1 Pinion Setting Gage - Arbor
- J 21777-42 Pinion Setting Gage - Front Pilot Washer
- J 21777-40 Pinion Setting Gage - Rear Pilot Washer
- J 23597-11 Pinion Setting Gage - Gage Plate
- J 23597-12 Pinion Setting Gage - Rear Pilot Washer
- J 21777-43 Pinion Setting Gage - Stud Assembly - Bolt
- J 21777-45 Pinion Setting Gage - Side Bearing Disc - 2 Req'd

Tools Required (8 1/2-Inch Ring Gear):

- J 8001 Dial Indicator Gage Set
- J 21777-1 Pinion Setting Gage - Arbor
- J 21777-29 Pinion Setting Gage - Gage Plate
- J 21777-35 Pinion Setting Gage - Rear Pilot Washer
- J 21777-42 Pinion Setting Gage - Front Pilot Washer
- J 21777-43 Pinion Setting Gage - Stud Assembly-Bolt
- J 21777-45 Pinion Setting Gage - Side Bearing Discs

Differential drive pinion gear depth is measured with a pinion setting gage. The gage provides a "nominal" or "zero" pinion as a gaging reference.

Disassemble

- Differential case. Refer to "Differential Case" in this section.

Remove or Disconnect

- Differential drive pinion gear inner bearing. Refer to "Differential Drive Pinion Gear Inner Bearing" in this section.

Clean

1. All parts of gage.
2. Differential bearing bore.
3. Differential drive pinion gear inner and outer bearing cups.
4. Lubricate outer bearing (23) and inner bearing (18) with axle lubricant. Use GM P/N 1052271, or equivalent.

Install or Connect

NOTICE: Refer to "Notice" on page 4B-1 of this section.

1. J 21777-43 through J 21777-35 or J 21777-40.

4B-24 REAR AXLE

2. J 23597-11 or J 21777-29.
3. J 21777-42 or J 21777-42 and nut in housing (37).

Tighten

- Nut to 2.3 N.m (20 lb. in.).
4. Rotate J 21777-29 or J 23597-11 to seat the bearings.
 5. Mount J 8001 on J 23597-1 or J 21777-1 and preload indicator against plunger about 1.27 mm (0.050 in.).
 6. J 21777-45 on J 23597-1 or J 21777-1 and position unit in housing (37).
 7. Bearing caps (29) and bolts/screws (28).

Tighten

- Bolts/screws (28) to 75 N.m (55 lb. ft.).

Adjust

- Differential drive pinion gear depth.
 - A. Rotate J 23597-1 or J 21777-1 slowly back and forth until J 8001 reads the greatest deflection (the point where the needle changes direction). At that point, set J 8001 to zero. Repeat rocking action to verify the zero setting.
 - B. After zero setting is obtained, rotate J 23597-1 or J 21777-1 just until the plunger no longer touches J 23597-11 or J 21777-29. This provides the gaging reference of a "zero" or "nominal" drive pinion gear (16).
 - C. Record J 8001 reading at pointer position. This indicates the proper shim (17) to use. Example: if pointer moved counterclockwise 1.70 mm (0.067 in.) to a dial reading of 0.84 mm (0.033 in.), this indicates a shim thickness of 0.84 mm (0.033 in.).
 - D. Required shim thickness is EQUAL to J 8001 reading.
 - E. Shims (17) are available in 0.03 mm to 0.94 mm (0.001 inch to 0.037 inch). Shim thickness is etched on the flat surface for easy identification.

Install or Connect

1. Loosen J 21777-43 and remove special tools and both bearings (4) from housing (37).
2. Correct shim (17) on drive pinion gear (16).

Important

- Proper differential drive pinion gear depth setting is a two-step procedure.
 - A. The set-up dimension arrived at using J 8001 is to be considered a starting point.

Figure 29 - Installing Differential Drive Pinion Gear Inner Bearing

Figure 30 - Installing Rear Axle Speed Sensor Ring

Figure 31 - Installing Differential Drive Pinion Gear Inner Bearing Race

Figure 32 - Pinion Gage Plate Installed in Rear Axle Housing

B. A differential ring gear tooth pattern check is necessary to fine tune the differential drive pinion gear depth and may indicate additional shim (17) changes to the differential drive pinion gear stem. Refer to "Tooth Contact Pattern Test" in this section.

- Both procedures must be performed to insure proper rear axle performance.

3. Differential drive pinion gear inner bearing. Refer to "Differential Drive Pinion Gear Inner Bearing" in this section.

Assemble

- Differential case. Refer to "Differential Case" in this section.

Measure

- Preload of the total at nut (27). With new inner and outer bearings (18 and 23), preload is 4.0 to 4.5 N.m (25 to 40 lb. in.) rotating torque with a new seal (24). With used inner and outer bearings (18 and 23), preload is 2.3 to 2.8 N.m (10 to 25 lb. in.) rotating torque with a new seal (24).

Figure 33 - Checking Differential Drive Pinion Gear Depth

4B-26 REAR AXLE

DIFFERENTIAL CASE (LIMITED SLIP)

Figure 34

The Auburn limited slip differential case is non-serviceable and must be replaced as an assembly. Removal and replacement of the differential case and service on the side bearings and ring gear is the same as for the standard rear axle.

Rear Disc Brakes	Section 5B2	Parking Brake	Section 5F

SECTION 5

GENERAL BRAKES

CAUTION: Certain components in the Antilock Brake System (ABS) are not intended to be serviced individually. Attempting to remove or disconnect certain system components may result in personal injury and/or improper system operation. Only those components with approved removal and installation procedures in Sections 5 and 5E1 should be serviced.

CAUTION: When servicing brake parts, do not create dust by grinding, sanding brake linings, or by cleaning brake parts with a dry brush or compressed air. Many brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm. A water dampened cloth or water based solution should be used to remove any dust on brake parts. Equipment is commercially available to perform this washing function. These wet methods will prevent asbestos fibers from becoming airborne.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen damage.

NOTICE: The use of rubber hoses or parts other than those specified for the Antilock Brake System may lead to functional problems requiring major overhaul. Replace all components included in repair kits used to service this system. Lubricate rubber parts with clean, fresh brake fluid to ease assembly. Do not use lubricated shop air on brake parts as damage to rubber components may result. If any hydraulic component is removed or brake pipe or hose assembly disconnected, it may be necessary to bleed all or part of the brake hydraulic system. The torque values specified are for dry, unlubricated fasteners.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

BRAKE FLUID AND FLUID HANDLING

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- **Eye contact** - rinse thoroughly with water.
- **Skin contact** - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen the damage.

Important

- Do not re-use fluid accumulated during brake hydraulic system bleeding.
- Always store fluid in a closed container. Reseal fluid containers immediately after use.
- Do not use fluid left in an open or improperly sealed container as it absorbs moisture or can become contaminated.

Substandard or Contaminated Brake Fluid

Use only hydraulic brake fluid GM P/N 1052535 or an equivalent DOT-3 fluid. DO NOT use power steering fluid, automatic transmission fluid or DOT-5

silicone hydraulic brake fluid. Use of an improper fluid or one contaminated with mineral oil or water may cause the fluid to boil or the rubber components in the brake hydraulic system to deteriorate.

Flushing Brake Hydraulic System

The entire brake hydraulic system should be flushed thoroughly with clean brake fluid whenever new parts are installed or if there is any doubt about the grade of the fluid in the system or if a fluid has been used which contains the slightest trace of mineral oil. Approximately 0.95L (1 quart) of fluid is required to flush the brake hydraulic system.

COMBINATION VALVE

The non-serviceable brake combination valve is located under the hood, mounted to a bracket below the brake master cylinder. The brake combination valve incorporates the following functions into a single component.

Metering Valve

The purpose of the metering valve is to limit or hold off hydraulic pressure to the front brake calipers until the rear brakes are activated. Rear brake line pressure must be sufficient to overcome the rear brake shoe return spring tension and the lining-to-drum clearance before the rear brakes are applied. The front brake calipers then may apply. When the brake pedal is not applied, brake fluid may flow freely through the metering valve. This allows normal fluid expansion and contraction.

Brake Pressure Differential Indicator Switch

The brake pressure differential indicator switch monitors the front and rear brake systems to measure any difference in hydraulic pressure between the two systems. If a sufficient pressure differential exists between the systems, an electrical ground is made energizing the red "BRAKE" indicator lamp if the ignition is in "RUN." The brake combination valve and brake pressure differential indicator switch are so designed that the indicator switch will latch in the warning position once a malfunction has occurred. The "BRAKE" lamp will turn off only after the malfunction is repaired and a pedal force sufficient to develop approximately 3 100 kPa (450 psi) hydraulic brake pressure is applied.

Brake Master Cylinder Proportioning Valve

The rear brake master cylinder proportion valve improves front-to-rear brake balance under severe brake application. Severe brake application transfers part of the vehicle rear weight to the front wheels. The resulting decrease in weight at the rear wheels can cause reduced braking efficiency. The brake master cylinder proportion valve limits the pressure to the rear brakes to reduce the tendency for decreased brake efficiency. The proportioning valve also has a bypass feature which assures full system pressure to the rear brakes in the event of a front brake system failure. Full front pressure is retained in the event of rear brake system malfunction.

WARNING LAMP OPERATION

Brake

The brake hydraulic system uses a single red "BRAKE" indicator lamp located in the instrument cluster. When the ignition switch is in the "START" position, the "BRAKE" indicator lamp should come on. It should go off when the ignition switch returns to the "RUN" position. The following conditions will activate the "BRAKE" indicator lamp:

1. Parking brake applied. The lamp should be on when the parking brake is applied and the ignition switch is "RUN."
2. Brake pressure differential warning switch detects a failure. Refer to "Brake Pressure Differential Warning Switch" in this section.
3. During engine cranking the "BRAKE" indicator lamp should remain on. This notifies the driver that the warning circuit is operating properly.

Antilock

The antilock brake system (ABS) uses two indicator lamps: a red "BRAKE" indicator lamp and an amber "ANTILOCK" indicator lamp, both located in the instrument cluster. Under normal conditions, these lamps should operate as follows:

1. When ignition is turned to the "RUN" position, prior to starting the engine, the amber "ANTILOCK" lamp should turn on.

2. As the engine is cranked, both the red "BRAKE" indicator lamp and the amber "ANTILOCK" indicator lamp should come on.
3. When the engine is started, both lamps should go out. The operation of these two indicator lamps is an important part of the antilock brake system (ABS) diagnosis. If the indicator lamps turn on while driving the vehicle, this indicates a malfunction. For further information regarding warning lamp operation for the antilock brake system (ABS), refer to SECTION 5E1.

DIAGNOSIS

BRAKE SYSTEM TESTING

Brakes should be tested on a dry, clean, reasonably smooth and level roadway. A true test of brake performance cannot be made if the roadway is wet, greasy or covered with loose dirt so that all tires do not grip the road equally. Testing will also be affected if the roadway is crowned, which would throw the weight of the vehicle toward the wheels on one side. If the roadway is too rough, the wheels will tend to bounce. Test brakes at different vehicle speeds with both light and heavy brake pedal pressure.

EXTERNAL CONDITIONS THAT AFFECT BRAKE PERFORMANCE

Tires

Tires having unequal contact and grip on the road will cause unequal braking. Tires must be equally inflated, and the tread pattern of right and left tires must be approximately equal.

Vehicle Loading

A heavily loaded vehicle requires more braking effort. When a vehicle has unequal loading, the most heavily loaded wheels require more braking power than others.

Wheel Alignment

Misalignment of the wheels, particularly excessive camber and caster, will cause the vehicle to pull to one side.

BRAKE SYSTEM

For diagnosis of the brake hydraulic system, refer to the diagnostic chart.

BRAKE PEDAL TRAVEL

Most low brake pedal problems are caused by air in the brake hydraulic system or mis-adjusted rear brakes. Bleed the system until air is purged and check rear brake adjustment. Refer to "Bleeding Brake Hydraulic System" in this section. Other less frequent causes of excessive brake pedal travel are incorrect power brake booster power piston pushrod length,

5-4 GENERAL BRAKES

improperly adjusted parking brake cable, rear brake shoe adjusters not operating, linings excessively worn, and brake hydraulic system leakage.

Tool Required:

J 28662 Brake Pedal Effort Gage

Measure

1. With engine off and key off, pump pedal until all reserve is exhausted from the power brake booster. A definite change in brake pedal feel will occur.
2. Install J 28662 onto pedal.
3. Hook end of tape measure over top edge of pedal and measure the distance to the rim of the steering wheel.
4. Apply pedal with 445 N (100 lb.) force and remeasure. The difference between both readings is the actual pedal travel and should not exceed 57.00 mm (2.250 inch).
5. If pedal travel is more than specifications, remove the brake master cylinder and check power brake booster pushrod length. Refer to SECTION 5D1. If power brake booster pushrod length is within specified range, repair or replace brake master cylinder. Refer to SECTION 5A.

BRAKE FLUID LEAKS

With engine running at idle and the shift lever in "NEUTRAL," depress the brake pedal and hold a constant foot pressure. If the pedal gradually falls away with the constant pressure, the brake hydraulic system may be leaking. Perform a visual check to confirm any suspected leak. Check the master cylinder fluid levels. While a slight drop in master cylinder reservoir level does result from normal lining wear, an abnormally low level in either master cylinder reservoir indicates a leak in the system. The brake hydraulic system may be leaking either internally or externally. Refer to SECTION 5A. Also, the system may appear to pass this test but still have slight leakage.

Check for possible fluid leaks at the brake pipe and brake hose connections. If any signs of leakage are found, replace the brake pipe or hose. Also, inspect the connecting brake component to determine if it is damaged and should be rebuilt or replaced. Check the front brake caliper boots and rear wheel cylinder boots for leaks. If any fluid appears to be leaking, rebuild or replace the caliper or rear wheel cylinder. Refer to SECTION 5B1, 5B2, or SECTION 5C2.

When checking the fluid levels, the master cylinder rear reservoir may be as low as 0.254 mm (1 inch) from the top if the front linings are worn. This is not abnormal.

Brake Hose and Pipe Inspection

Inspect

- Flexible hydraulic brake hoses, which transmit hydraulic pressure from the steel brake pipes on the body to the rear drum brakes and to the front

brake calipers, at least twice a year when the vehicle is on a lift for lubrication.

- Hoses for road hazard damage, cracks, and chafing of the outer cover, and for leaks and blisters.

— A light and mirror may be needed for an adequate inspection.

— If any of the above conditions are observed on a brake hose, it will be necessary to replace it.

BRAKE FLUID

NOTICE: Improper brake fluid, mineral oil or water in the fluid may cause rubber components in the brake hydraulic system to deteriorate. If master cylinder primary or secondary piston seals are swollen, the rubber parts have deteriorated. This deterioration may also be seen by swollen brake master cylinder reservoir diaphragm, rear wheel cylinder piston boots or front brake caliper piston boots. If rubber deterioration is evident, disassemble all hydraulic parts and wash with alcohol. Dry parts with compressed air before assembly to keep alcohol out of the system. Replace all rubber parts in the system, including brake hoses. Also replace the combination valve, since it has rubber components inside which are not serviceable. Check for brake fluid on the linings. If excessive fluid is found, replace the linings. The entire brake system must be flushed if there is any doubt as to the grade of fluid in the system or if a fluid has been used which contains the slightest trace of petroleum or mineral oil based fluids. All rubber parts, including the brake hoses, that have been subjected to a contaminated fluid must be replaced.

ON-VEHICLE SERVICE

BRAKE PEDAL

Figures 1 and 2

Remove or Disconnect

1. Left-hand instrument panel sound insulator. Refer to SECTION 8C.
2. Retainer (57) from brake pedal pin.
3. Outer washer (59), pushrod (54) and inner washer (58) from brake pedal pin.
4. Bolt/screw (55).
5. Four nuts (56) attaching pedal (2) to booster (40).
6. Daytime running lamp diode electrical connector, if equipped.
7. Pedal (2).
8. Bolt/screw (71), if equipped.
9. Diode (70) from pedal (2), if equipped.

Figure 1 - Brake Pedal

Install or Connect

NOTICE: Refer to "Notice" on page 5-1 of this section.

1. Diode (70) to pedal (2), if removed.
2. Bolt/screw (71), if removed.

Tighten

- Bolt/screw (71) to 1.9 N·m (17 lb. in.).
3. Pedal (2).
 4. Daytime running lamp diode electrical connector, if disconnected.
 5. Four nuts (56) attaching pedal (2) to booster (40).

Tighten

- Nuts (56) to 27 N·m (20 lb. ft.).
6. Bolt/screw (55).

Tighten

- Bolt/screw (55) to 24 N·m (18 lb. ft.).
7. Inner washer (58), pushrod (54) and outer washer (59) onto brake pedal pin.
 - Lubricate brake pedal pin before installing inner washer (58).
 8. Retainer (57) to brake pedal pin.
 9. Left-hand instrument panel sound insulator. Refer to SECTION 8C.

Figure 2 - Stoplamp Switch

STOPLAMP SWITCH

Figure 2

Remove or Disconnect

1. Left hand instrument panel sound insulator if Buick. Refer to SECTION 8C.

5-6 GENERAL BRAKES

2. Electrical connectors from switch (4).
3. Switch (4) from retainer (3).
4. Retainer (3) from pedal (2).

Install or Connect

1. Retainer (3) into pedal (2).
2. Switch (4) into retainer (3).
3. Electrical connectors to switch (4).

Adjust

- Stoplamp switch. Refer to "Stoplamp Switch Adjustment" below.
- 4. Left Hand instrument panel sound insulator, if Buick. Refer to SECTION 8C.

STOPLAMP SWITCH ADJUSTMENT

Figure 3

Adjust

With pedal (2) in fully released position, the stoplamp switch plunger should be fully depressed against the brake pedal shank. Adjust switch (4) by moving it in or out as necessary.

1. Insert switch (4) into tubular retainer (3) until stoplamp switch body seats on the tubular retainer (3).
 2. Pull pedal (2) to the rear, against switch (4) until brake pedal contacts its stop. The switch (4) will move in the tubular retainer (3) giving the proper adjustment.
- When no clicks are heard when the pedal (2) is pulled up, and the brake lamps do not stay on without the brakes being applied, the proper stoplamp switch adjustment is obtained.
 - For diagnosis of the taillamps, refer to SECTION 8A-110.

Figure 3 - Stoplamp Switch Adjustment

BRAKE PIPES

CAUTION: Always use double walled steel brake pipe when replacing brake pipes. The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and retain brake pipes may cause damage to the brake system and cause brake system failure.

Refer to Figures 4 through 7 for brake pipe routing and replacement. For brake pipe fitting torque specifications, refer to "Specifications" in this section. For information on the brake pressure modulator valve, refer to SECTION 5E1.

Double Lap Flare

Figures 6 and 8 through 11

Double lap flares are used for the rear brake rear pipe connection to rear wheel cylinders only (Figure 6). All other brake pipes use ISO flares.

Tool Required:

J 23530 Brake Line Flaring Tool
(45° Single and Double)

1. Obtain recommended tubing and steel fitting nuts of correct size.
 - Outside diameter of tubing is used to specify size.
2. Cut tubing to length.
 - Correct length may be determined by measuring old pipe using a string and adding 3 mm (1/8 inch) for each double flare.
3. Cut end square and chamfer inside and outside diameter of tubing with de-burring tool.
 - Remove all traces of lubricant from tubing.

NOTICE: Do not use single lap flaring tools. Double lap flaring tools must be used to produce a flare strong enough to hold the system pressure. Using single-lap flaring tools could cause system damage. A single-lap flare will split the tubing while a double-lap flare produces a well-formed, unbroken, reinforced double-walled flare.

4. Double lap flare tubing ends using J 23530.
 - A. Make sure fittings are installed before starting flare.
 - B. Unscrew compression screw until swivel cone is at its highest point.
 - Swing strap to one side.
 - C. Open lever handle so it is at right angle to rest of tool and revolve hexagonal tube lights to accommodate tubing (selection of six sizes).
 - D. Be sure fitting nut is properly placed on tubing. Insert end of tube between two blocks until level with top of gage.

03-28-95
BS0055

Figure 4 - Front Brake Pipe Routing

- E. Insert proper pin of gage into tubing and swing strap back in closed position. Tighten compression screw until gage bottoms on tool, then unscrew compression screw and swing strap to one side. Remove gage.
- F. Swing strap back in closed position, then tighten compression screw to flare cone downward to complete double lap flare.
- G. Unscrew compression screw and open smaller lever handle to remove pipe.
- H. Inspect flared ends for splits, cracks, pits or excessive out-of-round which may cause leaks.
- I. Blow pipe out with dry compressed air to remove any foreign objects.
5. Bend new pipe to match old using a tubing bender.

! Important

- Minimum clearance of 19 mm (3/4 inch) must be maintained to all moving components, 13 mm (1/2 inch) to all vibrating components and 7 mm (1/4 inch) to any shielded line, unless clipped to component.

ISO Flare

Figures 12 through 14

ISO flares are NOT to be used for rear brake rear pipe connection to rear wheel cylinders.

Tool Required:

J 29803-A ISO Flaring Kit

1. Obtain recommended tubing and steel fitting nuts of correct size.
 - Outside diameter of tubing is used to specify size.
2. Cut tubing to length.
 - Correct length may be determined by measuring old pipe using a string and adding 3 mm (1/8 inch) for each ISO flare.
3. Cut end square and chamfer inside and outside diameter of tubing with de-burring tool.
 - Remove all traces of lubricant from tubing.
4. ISO flare tubing ends using J 29803-A.
 - A. Make sure fittings are installed on tubing before starting flare.
 - B. Clamp flaring tool body in vise.

5-8 GENERAL BRAKES

Figure 5 - Frame Brake Pipe Routing

- C. Select correct size collet and forming mandrel for tube size used.
- D. Insert proper forming mandrel into tool body. While holding mandrel in place with your finger, thread in forcing screw until it makes contact and begins to move forming mandrel. When contact is made, turn forcing screw back one complete turn.
- E. Slide clamping nut over tubing into correct collet. Leave approximately 19 mm (3/4 inch) of tubing extending out of collet. Insert into tool body. Tube end must contact face of forming mandrel.
- F. Tighten clamping nut into tool body very tight or tube may push out.
- G. Wrench tighten forcing screw in until it bottoms. Do not tighten forcing screw further or flare may become over-sized.
- H. Back clamping nut out of tool body and disassemble clamping nut and collet. Flare is now ready for use.

5. Bend new pipe to match old using tube bender.

- Minimum clearance of 19 mm (3/4 inch) must be maintained to all moving components, 13 mm (1/2 inch) to all vibrating components and 7 mm (1/4 inch) to any shielded lines, unless clipped to component.

COMBINATION VALVE

Figures 15 and 16

Remove or Disconnect

1. Electrical connector from brake pressure differential warning switch.
 - Squeeze sides of connector to release tabs and pull up.
2. Pipes (8, 9, 41, and 43).
 - Plug open brake pipes (8, 9, 41, and 43) to prevent loss of brake fluid and entrance of dirt.
3. Two nuts (42) attaching valve (6) to booster (40).
4. Valve (6).

Figure 6 - Rear Drum Brake Pipe Routing

Install or Connect

NOTICE: Refer to "Notice" on page 5-1 of this section.

1. Valve (6).
2. Two nuts (42) attaching valve (6) to booster (40).

Tighten

- Nuts (42) to 25 N·m (18 lb. ft.).

3. Pipes (43, 41, 9, and 8).

Tighten

- Pipes (8, 9, 41, and 43) to 15 N·m (11 lb. ft.).
4. Electrical connector to brake pressure differential warning switch.
 5. Bleed brake hydraulic system. Refer to "Bleeding Brake Hydraulic System" in this section.

BRAKE HOSES

Front Brake Hose

Figure 17

Remove or Disconnect

1. Tire and wheel. Refer to SECTION 3E.

Clean

- Dirt and foreign material from hose (21) and fitting (22).
2. Brake pipe from hose (21).
 - Use a backup wrench on hose fitting.
 - Be careful not to bend bracket (17) or brake pipe.
 3. Retainer (19) from female fitting at bracket (17).
 4. Hose (21) from bracket (17).
 5. Place drain pan under brake caliper (20).

5-10 GENERAL BRAKES

Figure 11 - Completing Double Lap Flare

Figure 12 - Forming Mandrel and Forcing Screw

6. Fitting (22), hose (21), and two copper fitting gaskets (23) from front brake caliper (20).
 - Discard two copper gaskets (23).

Install or Connect

NOTICE: Refer to "Notice" on page 5-1 of this section.

1. Fitting (22), hose (21), and two new copper gaskets (23) to caliper (20).
 - Lubricate front brake hose fitting threads with brake fluid.

Figure 13 - Clamping Nut and Collet

Figure 14 - ISO Flare

- Front brake hose fitting flange must engage front brake caliper orientation ledge.

Tighten

- Fitting (22) to 44 N.m (32 lb. ft.).
2. Hose (21) into bracket (17).
 - There should be no kinks or twists in hose (21).
 3. Retainer (19) at bracket (17).
 4. Brake pipe to hose (21).
 - Use backup wrench on hose fitting.
 - Make sure that hose (21) does not make contact with any part of suspension. Check in extreme right and extreme left turn conditions.

Tighten

- Front brake pipe to 15 N.m (11 lb. ft.).
5. Bleed brake hydraulic system. Refer to "Bleeding Brake Hydraulic System" in this section.
 6. Tire and wheel. Refer to SECTION 3E.

5-12 GENERAL BRAKES

Rear Brake Hose

Figure 6

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.

Clean

- Dirt and foreign material from hose (11) and brake pipe fittings.
2. Pipe (10) from hose (11) at frame crossmember.
 - Use a backup wrench on rear brake hose fitting.
 - Be careful not to bend pipe (10).
 3. Retainer (12) from frame crossmember and hose (11).
 4. Hose (11) from frame crossmember.
 5. Left rear pipe (15) and right rear pipe (14) from hose (11).
 - Be careful not to bend left rear pipe (15) or right rear pipe (14).
 6. Bolt/screw (13) and hose (11) from rear axle.
 - Note position of hose (11) for proper location during installation.

Figure 15 - Brake Pressure Differential Warning Switch

Figure 16 - Brake Combination Valve

Figure 17 - Front Brake Hose

Install or Connect

NOTICE: Refer to "Notice" on page 5-1 of this section.

- Hose (11) and bolt/screw (13) to rear axle.

Tighten

- Bolt/screw (13) to 27 N·m (20 lb. ft.).
- Left rear pipe (15) and right rear pipe (14) into hose (11).

Tighten

- Left rear pipe (15) and right rear pipe (14) at hose (11) to 15 N·m (11 lb. ft.).
- Hose (11) into frame crossmember.
 - Be sure hose (11) is not twisted.
 - Retainers (12) on frame crossmember and hose (11).

Figure 18 - Rear Brake Hose

- Pipe (10) to hose (11) at frame crossmember.

Tighten

- Pipe (10) to hose (11) to 15 N·m (11 lb. ft.).
- Bleed brake hydraulic system. Refer to "Bleeding Brake Hydraulic System" in this section.
 - Lower vehicle.

Rear Brake Caliper Hoses - Rear Disc Brakes

Figure 18

Remove or Disconnect

- Raise and suitably support vehicle. Refer to SECTION 0A.

Clean

- Dirt and foreign material from hose (11) and brake pipe fittings.

5-14 GENERAL BRAKES

- Pipe (74) from hose (78) at bracket.
 - Be careful not to bend pipe (74).
- Bolt/screw (81) and hose (78) from caliper housing.
- Bolt/screw (79), hose (78), and retainer from rear axle.
 - Note position of hose (78) for proper location during installation.

↔ Install or Connect

NOTICE: Refer to “Notice” on page 5-1 of this section.

- Bolt/Screw (79), hose (78), and retainer to rear axle.

⌚ Tighten

- Bolt/Screw (79) to 10 N.m (89 lb. in.).
- Bolt/Screw (81) and hose (78) to caliper housing.

⌚ Tighten

- Bolt/Screw (81) to 40 N.m (29 lb. ft.).
- Pipe (74) to hose (78) at bracket.

⌚ Tighten

- Pipe (74) at caliper hose fitting to 15 N.m (11 lb. ft.).
- Bleed brake hydraulic system. Refer to “Bleeding Brake Hydraulic System” in this section.
- Lower vehicle.

BLEEDING BRAKE HYDRAULIC SYSTEM

CAUTION: Do not move the vehicle until a firm brake pedal feel is obtained. Air in the brake system can cause loss of brakes and could result in personal injury.

A bleeding operation is necessary to remove air from the hydraulic brake system whenever it is introduced into the hydraulic system. It may be necessary to perform an “Auto Bleed Procedure” if air has been introduced through a low fluid level condition or by disconnecting brake pipes at the master cylinder or brake pressure modulator valve. If a pipe is disconnected at one wheel, and the master cylinder did not lose all of its fluid (air was not introduced into the system), then that rear wheel cylinder or front brake caliper only needs to be bled. If pipes are disconnected at any fitting located between the brake pressure modulator valve and front or rear brakes, then the brake system served by the disconnected pipe must be bled.

Auto Bleed Procedure

The “Auto Bleed Procedure” is used to provide a complete brake system bleed on Bosch 5 equipped vehicles. The procedure cycles the system valves and

runs the pump to purge air from secondary circuits normally closed during a non-ABS/TCS mode operation and normal bleeding. It is to be used when it is suspected that air has been ingested into the brake system secondary circuits, or when the brake pressure modulator valve has been replaced with a new unit. Refer to SECTION 5E1 for procedure.

Manual Bleeding

Figure 19

Tool Required:

J 21472 Brake Bleeder Wrench

NOTICE: Refer to “Notice” on page 5-1 of this section.

Remove the vacuum reserve by applying the brakes several times, with the engine off.

- Fill the master cylinder reservoir with brake fluid and keep at least half full during the bleeding operation.
- If the master cylinder is known or suspected to have air in the bore, bleed it before bleeding any rear wheel cylinder or front brake caliper in the following manner:
 - Disconnect the front brake combination valve pipe fitting at the master cylinder.
 - Allow fluid to fill the master cylinder body bore until it begins to flow from the front brake combination valve pipe fitting port.
 - Connect the front brake combination valve pipe to the master cylinder and tighten.
 - Have a helper depress the brake pedal slowly one time and hold. Loosen the front brake combination valve pipe fitting at the master cylinder body to purge air from the bore. Tighten the fitting and then have a helper release the brake pedal slowly. Wait 15 seconds. Repeat the sequence, including the 15 second wait, until all air is removed from the brake master cylinder body bore. Care must be taken to prevent fluid from contacting any painted surface.

Figure 19 - Bleeding Brakes

**Tighten**

- Front brake combination valve pipe fitting at master cylinder to 32 N·m (24 lb. ft.).
- E. After all air has been removed at the front brake combination valve pipe fitting, repeat procedure outlined above to bleed the master cylinder at the rear brake combination valve fitting.

**Tighten**

- Rear brake combination valve pipe fitting at master cylinder to 32 N·m (24 lb. ft.).
3. Bleed individual rear brake calipers or wheel cylinders, or front brake calipers only after all air is removed from the brake master cylinder.
 4. If it is necessary to bleed all of the rear wheel brake calipers or cylinders, and front brake calipers, follow this sequence:
 - A. Right rear.
 - B. Left rear.
 - C. Right front.
 - D. Left front.
 5. Raise and suitably support vehicle. Refer to SECTION 0A.
 - A. Place a proper size box end wrench or J 21472 over the bleeder valve.
 - B. Attach a clear tube over front or rear brake caliper, or rear brake wheel cylinder bleeder valve, and allow tube to hang submerged in a clear container partially filled with brake fluid.
 - C. Have a helper depress the brake pedal slowly one time and hold. Loosen the bleeder valve to purge the air from the front caliper or wheel cylinder. Tighten brake caliper or rear brake wheel cylinder bleeder valve and slowly release brake pedal. Wait 15 seconds. Repeat the sequence, including the 15 second wait until all air is removed.

**Tighten**

- Front brake caliper bleeder valve to 13 N·m (115 lb. in.).
 - Rear brake caliper bleeder valve to 11 N·m (97 lb. in.).
 - Rear brake wheel cylinder bleeder valve to 7 N·m (62 lb. in.).
 - It may be necessary to repeat the sequence ten or more times to remove all the air.
- D. Rapid pumping of the brake pedal pushes the master cylinder secondary piston down the master cylinder body bore in a way that makes it difficult to bleed the rear side of the system.
 6. Lower vehicle.
 7. Fill master cylinder reservoir to proper level. Refer to SECTION 5A.
 8. Check the brake pedal for “sponginess” and the red “BRAKE” indicator lamp for indication of unbalanced pressure.
 - Repeat entire bleeding procedure to correct either of these two conditions.

Pressure Bleeding**Figure 20****Tools Required:**

- J 29532 Diaphragm Type Brake Bleeder
- J 29567 Brake Bleeder Adapter
- J 21472 Brake Bleeder Wrench
- J 39177 Combination Valve Pressure Bleeding Tool

NOTICE: Refer to “Notice” on page 5-1 of this section.

NOTICE: Pressure bleeding equipment must be the diaphragm type and must have a rubber diaphragm between the air supply and the brake fluid to prevent air, moisture, oil and other contaminants from entering the hydraulic system.

1. Install J 29567 to the cylinder (5).
2. Charge J 29532 to 140-172 kPa (20-25 psi).
3. Connect line to adapter.
 - Open line valve and depress bleed-off valve on top of adapter until a few drops of fluid appear.
4. Raise and suitably support vehicle. Refer to SECTION 0A.
5. Bleed the brakes in the following sequence:
 - A. Right rear.
 - B. Left rear.
 - C. Right front.
 - D. Left front.
6. Place a proper size box end wrench or J 21472 over the brake caliper or rear brake wheel cylinder bleeder valve.
7. Attach a clear tube over bleeder valve and allow tube to hang submerged in a clear container partially filled with brake fluid.
8. Open brake bleeder valve and allow fluid to flow until no air is seen in the fluid.

Figure 20 - Pressure Bleeding Adapter

5-16 GENERAL BRAKES

9. Close bleeder valve.

- Be sure it seals.

Tighten

- Front brake caliper bleeder valve to 13 N.m (115 lb. in.).
 - Rear brake wheel cylinder bleeder valve to 7 N.m (62 lb. in.).
 - Rear brake caliper bleeder valve to 11 N.m (97 lb. in.).
10. Repeat steps 7 through 10 until all calipers and/or wheel cylinders have been bled.
11. Lower vehicle.
12. Check the brake pedal for “sponginess” and the red “BRAKE” indicator lamp for indication of unbalanced pressure.
- Repeat entire bleeding procedure to correct either of these two conditions.
13. Remove brake bleeding equipment from master cylinder (5).
14. Fill master cylinder reservoir to the proper level. Refer to SECTION 5A.

FLUSHING BRAKE HYDRAULIC SYSTEM

NOTICE: Use only DOT 3 brake fluid from a clean, sealed container. Do not use any fluid from a container which is contaminated with water. Do not use DOT 5 silicone brake fluid. Improper brake fluid, mineral oil or water in the fluid may cause the fluid to boil or the rubber components to deteriorate. Keep all fluid containers capped to prevent contamination.

The complete hydraulic system should be flushed thoroughly with clean brake fluid whenever new parts are installed in the hydraulic system. The system must be flushed if there is any doubt about the grade of fluid in the system or if fluid has been used which contains the slightest trace of mineral oil. Approximately 0.95 L (1 quart) of brake fluid is required to flush the brake hydraulic system. All rubber parts, including brake hoses that have been subjected to a contaminated fluid must be replaced.

MASTER CYLINDER

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen damage.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

MASTER CYLINDER

This brake master cylinder is a composite design (plastic reservoir and aluminum body) incorporating a conventional front to rear brake system split. The master cylinder primary piston provides the fluid pressure to the front disc brakes, while the master cylinder secondary piston provides the fluid pressure to the rear brake systems. If pressure is lost from either system, the remaining system will function to stop the vehicle.

A quick take-up feature provides a large volume of fluid to the brakes at low pressure with initial brake application. The low pressure fluid quickly provides the displacement requirements created by the seal retraction of the front (and rear if equipped) brake caliper pistons into the brake calipers and the retraction of rear brake primary and secondary shoes.

The secondary piston includes a centering valve that improves the performance of the master cylinder

under low pressure brake application when the antilock brake system (ABS) is engaged. This valve is not serviceable.

MASTER CYLINDER RESERVOIR

Figure 1

Since this vehicle does not use a low fluid level indicator for the brake system, the brake master cylinder reservoir has two windows, which allow the brake fluid level to be checked without removal of the brake master cylinder reservoir cover.

BRAKE PRESSURE DIFFERENTIAL WARNING SWITCH

The brake pressure differential warning switch constantly compares brake pressure in both parts of the system. The switch will activate the red "BRAKE" indicator lamp in the instrument cluster in the event of a failure in either part. The brake combination valve is designed so the switch will stay

5A-2 MASTER CYLINDER

in the warning position once a failure has occurred. The lamp can only be turned off by repairing the failure and applying a brake pedal force as required to develop up to 3 100 kPa (450 psi) line pressure.

For diagnosis of the brake pressure differential warning switch, refer to SECTION 8A. For replacement of the brake combination valve refer to SECTION 5.

BRAKE FLUID AND FLUID HANDLING

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any is spilled on the vehicle, flush the area with water to lessen the damage.

! Important

- Do not re-use brake fluid accumulated during brake hydraulic system bleeding.
- Always store fluid in a closed container. Reseal containers immediately after use. Do not use fluid left in an open or improperly sealed container as it absorbs moisture or may be contaminated.

SUBSTANDARD OR CONTAMINATED BRAKE FLUID

Use only brake fluid GM P/N 1052535 or an equivalent DOT-3 fluid. DO NOT use power steering fluid, automatic transmission fluid, or DOT-5 silicone hydraulic brake fluid. Use of an improper fluid or one contaminated with mineral oil or water may cause the brake fluid to boil or the rubber components in the brake hydraulic system to deteriorate. This deterioration may be seen by a swollen brake master cylinder reservoir diaphragm or swollen brake master

Figure 1 - Brake Master Cylinder Reservoir Windows

cylinder primary or secondary seals. If rubber deterioration is evident, the entire brake system must be flushed and all rubber components replaced. Refer to SECTION 5.

DIAGNOSIS

MASTER CYLINDER CHECK

1. Check for a cracked master cylinder body or brake fluid around the master cylinder.
 - Leaks are indicated only if there is at least a drop of fluid.
 - A damp condition is not abnormal.
2. Check for a binding brake pedal linkage and incorrect power brake booster power piston pushrod length.
 - A. If both of these are satisfactory, disassemble the master cylinder and check for swollen or elongated primary or secondary piston seal(s).
 - B. If swollen primary or secondary seals are found, substandard or contaminated brake fluid should be suspected.
 - C. If contaminated, all components should be disassembled and cleaned; all rubber components should be replaced and all brake pipes flushed.

For diagnostic information of master cylinder malfunctions, refer to SECTION 5.

ON-VEHICLE SERVICE

! Important

- Replace all components included in repair kits used to service this brake master cylinder.
- Lubricate rubber parts with clean brake fluid to ease assembly.
- Do not use lubricated shop air on brake parts as damage to rubber components may result.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake hydraulic system.
- The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench, free from all mineral oil materials.

FILLING MASTER CYLINDER RESERVOIRS

The master cylinder must be kept properly filled to insure adequate reserve and to prevent air from entering the brake hydraulic system. However, because of expansion due to heat absorbed from brakes and from engine, the reservoirs must not be overfilled. Thoroughly clean master cylinder reservoir cover before removal to avoid getting dirt into reservoir. Remove cover and reservoir diaphragm.

NOTICE: Use only DOT-3 brake fluid from a clean, sealed container. Do not use any fluid from a container which is wet with water. Do not use DOT-5 silicone brake fluid. Improper brake fluid, mineral oil or water in the brake fluid may cause it to boil or the rubber components to deteriorate. Keep all containers capped to prevent contamination.

Add brake fluid GM P/N 1052535 or equivalent as required to bring level between the high and low fill mark on the inner rear side of the reservoir. Normal fill is 10.5 mm to 15.5 mm (0.413 to 0.610 inch) below the top of the reservoir.

MASTER CYLINDER

Figure 2

Remove or Disconnect

1. Brake fluid from master cylinder reservoir.
 - Discard old fluid.
2. Pipes (11 and 16) from cylinder (9).
 - Plug open pipes (11 and 16) to prevent brake fluid from contacting painted surfaces and contamination.
3. Two nuts (12) attaching valve (15) to booster (10).
4. Valve (15) and reposition.
5. Cylinder (9).

Install or Connect

NOTICE: Refer to "Notice" on page 5A-1 of this section.

1. Cylinder (9).
2. Valve (15) and reposition.
3. Two nuts (12) attaching valve (15) to booster (10).

Tighten

- Nuts (12) to 29 N·m (21 lb. ft.).
4. Pipes (11 and 16) to cylinder (9).

Tighten

- Pipes (11 and 16) to 32 N·m (24 lb. ft.).
5. Bleed brake hydraulic system. Refer to SECTION 5.

UNIT REPAIR

MASTER CYLINDER

Figure 3

Important

- Reservoir cover (1) and diaphragm (2) can be inspected and/or serviced without removing the master cylinder from the vehicle.

Figure 2 - Brake Master Cylinder

5A-4 MASTER CYLINDER

Figure 3 - Brake Master Cylinder Components

- Do not remove the quick take-up valve from the master cylinder body (8). This valve cannot be serviced.

- Abrasives should not be used in brake master cylinder body bore.

Disassemble

1. Cover (1) and diaphragm (2) from reservoir (3).
 - Wipe cover (1) clean before removing.
 2. Empty brake fluid from reservoir (3).
- NOTICE:** Take care not to damage the piston bore or retainer groove during primary piston retainer ring removal.
3. Ring (5) while depressing primary piston (6).
 4. Primary piston (6) and secondary piston (7).
 - To remove parts, apply low pressure dry compressed air into the outlet port near the closed end of the bore with the other outlet port plugged.

Inspect

- Cover (1) and diaphragm (2) for cuts, cracks, nicks and deformation.
- Brake master cylinder body bore for scoring or corrosion. If noted, replace body (8).
- Replace damaged parts.

Clean

- All parts in clean denatured alcohol.
- Dry with unlubricated compressed air.

Assemble

1. Lubricate rubber parts with clean brake fluid to ease assembly.
2. Lubricated secondary piston (7) into brake master cylinder body bore.
3. Lubricated primary piston (6) into brake master cylinder body bore.
4. Ring (5) while depressing primary piston (6).
5. Diaphragm (2) into cover (1).
6. Diaphragm (2) and cover (1) onto reservoir (3).

MASTER CYLINDER RESERVOIR

Figures 4 and 5

Disassemble

1. Master cylinder. Refer to "Master Cylinder" in preceding procedure.

NOTICE: Do not clamp housing area of body in vise or the part may be damaged.

2. Clamp the flange of the body (8) in a vise.
3. Reservoir (3) from grommets (4), using a pry bar.
4. Grommets (4) from body (8).

Figure 4 - Removing Brake Master Cylinder Reservoir

Inspect

- Reservoir (3) for cracks or deformation. Replace reservoir (3) if any damage is found.
- Grommets (4) for deterioration. Replace reservoir grommets (4), if necessary.

Figure 5 - Installing Brake Master Cylinder Reservoir

Clean

- Reservoir (3) with clean denatured alcohol.
- Dry with unlubricated compressed air.

Assemble

1. Lubricate new grommets (4) and reservoir flanges with clean brake fluid.
2. Lubricated grommets (4) into body (8).
 - Make sure grommets (4) are properly seated.
3. Reservoir (3) into body (8) and grommets (4), using a rocking motion.
4. Master cylinder. Refer to "Master Cylinder" in preceding procedure.

FRONT DISC BRAKES

CAUTION: When servicing brake parts, do not create dust by grinding, sanding brake linings, or by cleaning brake parts with a dry brush or compressed air. Brake parts may contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm. A water dampened cloth or water based solution should be used to remove any dust on brake parts. Equipment is commercially available to perform this washing function. These wet methods will prevent asbestos fibers from becoming airborne.

CAUTION: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious injury.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen damage.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

FRONT BRAKE ROTOR

The brake rotor is a highly machined, cast iron finned type. It is mounted to the steering knuckle spindle and also acts as the hub for the front wheels.

FRONT BRAKE CALIPER

The full floating caliper has a single bore and is mounted to the steering knuckle with two bolts/screws. When the brakes are applied, fluid pressure behind the piston increases. Pressure is exerted equally against the bottom of the piston and also against the bottom of the caliper housing bore. The pressure applied to the

5B1-2 FRONT DISC BRAKES

piston is transmitted to the inner pad, forcing the lining against the inner rotor surface. The pressure applied to the bottom of the caliper housing bore forces the caliper to slide on the caliper bolts/screws toward the center of the vehicle. This movement causes the outer section of the caliper to apply pressure against the back of the outer pad, forcing the lining against the outer rotor surface. As line pressure builds, the inner and outer pads are pressed against the rotor surfaces with increased force, bringing the vehicle to a stop. When the brake pedal is released, line pressure is released and the piston seal and groove cause the piston to be slightly retracted, resulting in less drag on the rotor by the inner and outer pads.

Outward movement of the piston and inward movement of the caliper automatically compensate for lining wear. As the linings wear, the increased area behind the piston is filled with brake fluid from the brake master cylinder reservoir.

DIAGNOSIS

FRONT DISC BRAKE INNER AND OUTER PADS INSPECTION

Figure 1

Inspect

- Inner and outer pads at least twice a year when the wheels are removed (tire rotation, etc).

Figure 1 - Front Disc Brake Inner and Outer Pads Inspection

When inspecting front disc brakes, check both ends of the outer pad by looking in at each end of the caliper. These are the points at which the highest rate of wear normally occurs. Also, check the lining thickness of the inner pad to make sure that it has not worn prematurely. Look through the hole in the top of the caliper to view the inner pad. Inner and outer pads should be replaced when the thickness of any lining is worn to within 0.76 mm (0.030 inch) of the shoe or rivet. All inner and outer pads should be replaced in axle sets.

All front disc brakes have a wear indicator that makes a noise when the linings wear to a degree where replacement is required. The wear indicator is an integral part of the inner pad. When the lining is worn, the clip indicator contacts the rotor and produces a warning noise.

Check the flatness of linings. Place inner and outer pad surfaces together and check for gap between surfaces. If more than 0.13 mm (0.005 inch) gap is measured midway between attaching lugs, inner and outer pads must be replaced.

FRONT BRAKE ROTOR INSPECTION

Front Brake Rotor Tolerance and Surface Finish

In manufacturing the rotor, tolerances of the braking surfaces for flatness, thickness variation and lateral runout are held very close. The maintenance of close tolerances on the shape of the braking surfaces is necessary to prevent brake roughness.

In addition to these tolerances, the surface finish must be held to a specified range. A new rotor falls into this surface finish range, as will a rotor that is refinished exactly as directed in "Refinishing Front Brake Rotor" under "Unit Repair" in this section. The control of the braking surface finish is necessary to avoid problems of hard pedal-apply, excessive brake fade, pulls and erratic performance and to extend lining life.

Light scoring of the rotor surfaces not exceeding 1.5 mm (0.060 inch) in depth, which may result from normal use, will not affect brake operation.

Thickness Variation Check

Thickness variation can be checked by measuring the thickness of the front brake rotor at four or more points around its circumference. All measurements must be made at the same distance in from the edge of the rotor. A rotor that varies by more than 0.013 mm (0.0005 inch) can cause brake pedal pulsation and/or front end vibration during brake applications. A rotor that does not meet these specifications should be refinished to specifications or replaced.

Lateral Runout Check

Figure 2

Tool Required:

J 8001 Dial Indicator Set

Lateral runout is the movement of the rotor from side to side as it rotates on the steering knuckle spindle. This could be described as "rotor

Figure 2 - Checking Lateral Runout

wobble.” The movement of the rotor from side to side in the lateral plane knocks the pads away from the rotor, causing the piston to be knocked back into its bore. This results in additional pedal travel required and a vibration during the braking action.

Measure

1. Remove front brake caliper. Refer to “Front Brake Caliper” under “On-Vehicle Service” in this section.
2. Adjust front wheel bearings until zero play is obtained (for measuring purposes only). Refer to SECTION 3C.
3. Fasten J 8001 to the steering knuckle so that the indicator button contacts the rotor surface about 13 mm (0.5 inch) from the edge.
4. Zero J 8001.
5. Move rotor (17) one complete revolution, and observe total indicated runout (TIR).
 - Total indicated runout (TIR) should not be more than 0.10 mm (0.004 inch).
 - A front brake rotor (17) that does not meet the lateral runout specification should be resurfaced or replaced as necessary.
6. Install front brake caliper. Refer to “Front Brake Caliper” under “On-Vehicle Service” in this section.

FRONT BRAKE CALIPER INSPECTION

The front brake caliper must be disassembled for inspection. Refer to “Front Brake Caliper” under “Unit Repair” in this section.

ON-VEHICLE SERVICE

Important

- Replace all components included in repair kits used to service this front brake caliper.
- Lubricate rubber parts with clean brake fluid to ease installation.

- Do not use lubricated shop air on brake parts as damage to rubber components may result.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- Replace front disc brake inner and outer pads in axle sets only.
- The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench free from all mineral oil materials.

FRONT BRAKE CALIPER

Figures 3 through 7

Remove or Disconnect

1. Two-thirds of the brake fluid from the brake master cylinder.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Tire and wheel. Refer to SECTION 3E.
4. Bottom piston (10) into caliper housing bore to provide clearance between linings and rotor (17).
 - A. Position C-clamp on housing (13) and against outer pad.
 - B. Tighten clamp slowly to press piston (10) into caliper housing bore.

Important

- If removing caliper only to access other brake parts, skip step 6.
 - If fitting (14) is disconnected, caliper must be bled after installation.
5. Fitting (14), copper gaskets (15), and hose (16) from housing (13), if removing the caliper entirely from the vehicle.
 - A. Plug the openings in the hose (16) and housing (13) to prevent brake fluid loss and contamination.
 - B. Discard gaskets (15).
 6. Front brake caliper bolts/screws (1) and sleeves (2).
 7. Caliper from rotor (17) and knuckle (18).
 - If the caliper is not being removed from the vehicle for unit repair, suspend it from the frame using a locally fabricated wire hook.

Inspect

- Bolts/screws (1) and sleeves (2) for corrosion.
 - If corrosion is found, use new parts, including inner or outer bushings (3 and 4) when installing caliper.
 - Do not attempt to polish away corrosion.

5B1-4 FRONT DISC BRAKES

Figure 3 - Front Brake Caliper Components

Figure 4 - Compressing Front Brake Caliper Piston

- Fitting (14) and hose (16).
 — If nicks or burrs are noticed on fitting (14) or cuts or deterioration on hose (16), replace fitting and hose.

Install or Connect

NOTICE: Refer to “ Notice” on page 5B1-1 of this section.

1. Lubricate sleeves (2) and inner and outer bushings (3 and 4) with silicone grease GM P/N 12345579 or equivalent.
2. Sleeves (2) into housing (13).
3. Caliper onto rotor (17) and knuckle (18).
4. Bolts/screws (1).

Tighten

- Bolts/screws (1) to 51 N•m (38 lb. ft.).

Measure

- Clearance between the housing (13) and the stops on knuckle (18). Clearance should be 0.13 to 0.30 mm (0.005 to 0.012 inch).
- If necessary, remove caliper and file ends of the stops on knuckle (18) to provide proper clearance.

Figure 9 - Front Disc Brake Inner Pad Retainer Spring

Figure 10 - Lifting Front Brake Caliper Piston Boot

Figure 11 - Installing Front Disc Brake Inner Pad

Clean

- Wipe outside surface of boot (9).
- Use denatured alcohol.

Tighten

- Bottom piston (10) into caliper housing bore using a large C-clamp positioned on housing (13) and inside piston well.
- Tighten clamp slowly to press piston (10) into caliper housing bore.

Figure 12 - Installing Front Disc Brake Outer Pad

Figure 13 - Clinching Procedure

Figure 14 - Checking Front Disc Brake Outer Pad Clench

- A. With piston (10) bottomed in housing bore, lift inner edge of boot (9) next to front piston (10) and press out any trapped air.
- B. Boot (9) must lay flat.

**Install or Connect**

NOTICE: Refer to “Notice” on page 5B1-1 of this section.

1. Lubricate new inner and outer bushings (3 and 4) and sleeves (2) with silicone grease GM P/N 12345579 or equivalent.
2. Inner and outer bushings (3 and 4) and sleeves (2) into the grooves in housing (13).
3. Spring (8) on inner pad (6).
4. Inner pad (6).
 - A. Snap spring (8) into piston (10).
 - B. The wear sensor should be at the leading edge of inner pad (6) during forward wheel rotation. If not, inner pad (6) is on wrong side of vehicle.
 - C. The inner pad (6) must lay flat against the piston (10).
 - D. Check that boot (9) and inner pad (6) are not touching. If there is contact, remove inner pad (6) and remove any trapped air in boot (9).
5. Outer pad (5).
 - The back of outer pad (5) must lay flat against housing (13).
6. Front brake caliper. Refer to “Front Brake Caliper” under “On-Vehicle Service” in this section.
7. Clinch shoe tabs.
 - A. Do upper tab first by positioning a metal chisel or other suitable wedge between outer pad (5) and rotor (17).
 - B. Secure chisel so that there is maximum clearance between shoe tab and caliper casting ear.
 - Prevents outer pad (5) from moving.
 - C. Position brass punch against shoe tab. Strike punch with hammer to drive the shoe tab down against the front brake caliper casting ear.
 - D. Repeat until shoe tab is securely clinched on front brake caliper casting ear.
 - Repeat procedure for lower tab.

**Inspect**

- A. Pull caliper out to get clearance between rotor (17) and outer pad (5).
- B. Push on back of outer pad (5) with thumb to insure clinch is tight. There should be no movement of outer pad (5).
8. Apply approximately 778 N (175 lb.) of force to the brake pedal three times to seat the linings.
9. Burnish front brake rotors. Refer to “Burnishing Front Brake Rotors” in this section.

**Important**

- GM replacement brake lining material is recommended for all GM vehicles to maintain the balance between front and rear brake performance. GM replacement brake parts have been carefully selected to provide the proper brake balance for purposes of both stopping distance and controllability over the full range of operating conditions. Installation of front or rear brake lining material with performance different from that of the GM replacement parts recommended for this vehicle can change the intended brake balance of this vehicle.

UNIT REPAIR**REFINISHING FRONT BRAKE ROTOR**

NOTICE: Whenever a front brake rotor is removed, check the ABS wheel speed sensor and sensor ring for dirt or debris. A dirty sensor may cause intermittent ABS wheel speed sensor fault. Wipe using a clean cloth. Do not use chemicals or the sensor may be damaged.

**Important**

- DO NOT refinish front brake rotors when performing routine brake maintenance such as replacing worn front disc brake inner and outer pads. Refinish a front brake rotor **ONLY** under the following circumstances:
 1. There is a complaint of brake pulsation.
 2. There is scoring greater than 1.5 mm (0.060 inch).

All rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum refinish dimension is greater than the discard dimension. Do not use a brake rotor that, after refinishing, will not meet specifications shown on the rotor. Always replace it with a new rotor.

Since accurate control of the rotor tolerances is necessary for proper performance of the front disc brakes, the rotor should be machined only with precision equipment. Equipment should be serviced on a regular basis following the manufacturer's recommended maintenance procedure.

When refinishing rotors, the attaching adapters, tool holders, vibration dampeners and tool bits must be in good condition. Always use sharp cutting tools or bits and use only replacement cutting bits recommended by the equipment manufacturer. Dull or worn tools leave a poor surface finish which will affect braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish. Make sure these adapters are clean and free of nicks.

5B1-8 FRONT DISC BRAKES

On-Vehicle

Tool Required:

J 37704 On Vehicle Disc Brake Lathe

In cases where rotors are being refinished to correct a problem with brake pulsation, it is recommended that J 37704 be used to achieve the best results. Follow the manufacturer's recommended specifications and procedures.

Off-Vehicle

Following are two recommended procedures for front brake rotor machining that achieve adequate results using two different off-car drum/disc brake lathes. (If any other lathe is used, follow that lathe's instructions and recommendations).

AMMCO® BRAKE LATHE (TWO-CUT REFINISHING PROCEDURE)

	ROUGH CUT	FINISH CUT
Spindle Speed	150 rpm	150 rpm
Depth of Cut (per side)	0.15 to 0.6 mm (0.006 to 0.025 in.)	0.10 to 0.15 mm (0.004 to 0.006 in.)
Cross Feed (per rev.)	0.25 mm (0.010 in.)	0.05 mm (0.002 in.)
Vibration Dampener	Yes	Yes
Sand Front Brake Rotor (Swirl Pattern)	No	Yes

ACCUTURN® BRAKE LATHE (ONE-CUT REFINISHING PROCEDURE)

Locate the deepest score and turn the rotor micrometer knob until the tool bit bottoms out at the deepest point of the score. Zero the scale and back out the tool bit (repeat for opposite side of rotor). Advance the cutter handwheel until the bits have cleared the inner edges of the rotor face. Adjust the micrometer knobs for approximately 0.13 mm (0.005 in.) more than the first reading. This will ensure resurfacing the rotor in one cut.

	SINGLE CUT
Spindle Speed	105 rpm
Depth of Cut	As necessary
Cross Feed (per rev.)	0.08 mm (0.003 in.)
Sand Front Brake Rotor (Swirl Pattern)	Yes
Vibration Dampener	Yes

NON-DIRECTIONAL FINISHING

It is very important that the rotor surface be made nondirectional by dressing the surfaces with a sanding disc tool such as Ammco® 8750 Safe Swirl

Disc Rotor Grinder, Accuturn® 433179 Non-Directional Swirl Finisher, or equivalent, using 120 grit aluminum oxide sandpaper. Sand each rotor surface with moderate pressure for a minimum of 60 seconds.

If the brake lathe is not equipped with an adequate non-directional finishing tool, an alternate method is to use a sanding block with 150 grit aluminum oxide sandpaper. With the rotor turning at the equipment manufacturer's highest recommended cutting speed, sand each rotor surface for a minimum of 60 seconds using moderate pressure.

After the rotor has been sanded, clean each surface with denatured alcohol or a suitable brake cleaner. The finished rotor surface should be as close to that of a new front brake rotor as possible. Failure to obtain the best possible finish may affect braking performance.

Important

- Rotors should always be replaced if turning will result in a rotor that does not meet manufacturer specifications for minimum thickness.

BURNISHING FRONT BRAKE ROTORS

After inner and outer pads have been replaced and/or rotors have been refinished, it is recommended that the new braking surface be broken in, or burnished. This can be accomplished by making 20 stops from 48 km/h (30 mph), using medium to firm brake pedal pressure. Take care to avoid overheating the brakes.

FRONT BRAKE CALIPER

Figures 15 through 19

Tool Required:

J 22904 Dust Boot Seal Installer

Disassemble

CAUTION: Do not place fingers in front of the front brake caliper piston in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious injury.

NOTICE: Do not use a metal tool to remove the piston seal from the caliper housing bore. Using a metal tool may damage the caliper bore or seal groove.

NOTICE: Use clean shop towels to pad the interior of the housing during caliper piston removal. Use just enough air to ease the piston out of the bore. If the piston is blown out, even with the padding provided, it may be damaged.

1. Piston (10) from housing (13).

Figure 15 - Removing Front Brake Caliper Piston

Figure 16 - Front Brake Caliper Components

Figure 17 - Removing Front Brake Caliper Piston Boot

Figure 18 - Installing Front Brake Caliper Piston Boot

Figure 19 - Seating Front Brake Caliper Piston Boot

- Apply compressed air to the caliper housing inlet hole.

Inspect

- Piston (10) for scoring, nicks, corrosion, and worn or damaged chrome plating.
- Replace piston (10) if any of the above are found.

2. Boot (9) from housing (13).

NOTICE: Do not use a metal tool to remove the front brake caliper piston seal from the front brake caliper housing bore. Using a metal tool may damage the front brake caliper housing bore or seal groove.

3. Seal (11) from the housing (13).

5B1-10 FRONT DISC BRAKES

- Use a small wood or plastic tool.

Inspect

- Caliper housing bore and seal groove for scoring, nicks, corrosion, and wear.
 - A. Use crocus cloth to polish out light corrosion.
 - B. Replace housing (13) if corrosion in and around seal groove will not clean up with crocus cloth.

4. Valve (12) and cap (19) from housing (13).

Assemble

NOTICE: Refer to "Notice" on page 5B1-1 of this section.

Clean

- All parts in clean denatured alcohol.
- Dry with unlubricated compressed air.
- Blow out all passages in housing (13) and valve (12) with compressed air.

1. Lubricate all rubber parts with clean brake fluid.
2. Valve (12) into housing (13).

Tighten

- Valve (12) to 13 N·m (115 lb. in.).
3. Replace cap (19).
 4. Seal (11) into the bore groove of housing (13).
 - Make sure seal (11) is not twisted.
 5. Boot (9) onto piston (10).
 6. Piston (10) with assembled boot (9) into the bore of housing (13).
 - Push piston (10) to the bottom of the caliper housing bore.
 7. Seat boot (9) into the counterbore of housing (13) using J 22904.

SPECIFICATIONS

GENERAL SPECIFICATIONS

Front Brake Caliper Housing Bore Diameter.....	75.00 mm (2.952 inch)
Front Brake Caliper-to-Steering Knuckle and Hub Clearance	0.13 mm to 0.30 mm (0.005 to 0.012 inch)

FRONT BRAKE ROTOR

Diameter (Nominal).....	305.00 mm (12.000 inch)
Lateral Runout	0.10 mm (0.004 inch)
Thickness Variation.....	0.013 mm (0.0005 inch)
Thickness (New).....	26.50 mm (1.043 inch)
Minimum Thickness after Refinish.....	24.89 mm (0.980 inch)
Discard Thickness.....	24.51 mm (0.965 inch)

- All front brake rotors have a discard dimension cast in them. This is a wear dimension and not a refinish dimension. Any front brake rotor which does not meet the specification should be replaced.

ROTOR REFINISHING SPECIFICATIONS

AMMCO® BRAKE LATHE

Rough Cut

CAUTION: When servicing brake parts, do not create dust by grinding, sanding brake linings, or by cleaning brake parts with a dry brush or compressed air. Many brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm. A water dampened cloth or water based solution should be used to remove any dust on brake parts. Equipment is commercially available to perform this washing function. These wet methods will prevent asbestos fibers from becoming airborne.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen damage.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The rear disc brake caliper has a single piston in an aluminum housing which is suspended in the anchor bracket on two guide pins. Hydraulic pressure, created by applying force to the brake pedal, acts equally against the piston and the bottom of the

caliper bore to move the piston outward and to slide the caliper inward resulting in a clamping action on the rotor. This clamping action forces the linings against the rotor creating friction to stop the vehicle. Parking brake application is completely independent of the hydraulic braking system. Refer to SECTION 5F for more information.

DIAGNOSIS

REAR DISC BRAKE INNER AND OUTER PAD INSPECTION

Figure 1

Inspect

- Inner and outer pads at least twice a year when the wheels are removed (tire rotation, etc.). When inspecting rear disc brakes, check both ends of the outer pad by looking in at each end of the caliper. These are the points at which the highest rate of wear normally occurs. Also, check the lining thickness of the inner pad to make sure that it has not worn prematurely. Look through the hole in the top of the caliper to view the inner pad. Inner and outer pads should be replaced when the thickness of any lining is worn to within 0.76 mm (0.030 inch) of the shoe. All inner and outer pads should be replaced in axle sets.

Measure

- Flatness of inner and outer pad linings. Place inner and outer pad surfaces together and check for gap between surfaces. If more than 0.13 mm (0.005 inch) gap is measured midway between attaching lugs, inner and outer pad assemblies must be replaced.

REAR BRAKE ROTOR INSPECTION

Rear Brake Rotor Tolerance and Surface Finish

In manufacturing the rotor, tolerances of the braking surfaces for flatness, thickness variation and lateral runout are held very close. The maintenance of close tolerances on the braking surfaces is necessary to prevent brake roughness.

Figure 1 - Rear Disc Brake Inner and Outer Pad Inspection

Light scoring of the rotor surfaces not exceeding 1.5 mm (0.06 inch) in depth, which may result from normal use, will not affect brake operation.

Thickness Variation Check

Thickness variation can be checked by measuring the thickness of the rear brake rotor at four or more points around its circumference. All measurements must be made at the same distance in from the edge of the rotor. A rotor that varies by more than 0.013 mm (0.0005 inch) can cause brake pedal pulsation and/or rear end vibration during brake applications. A rotor that does not meet these specifications should be refinished to specifications or replaced.

Lateral Runout Check

Figure 2

Tool Required:

J 8001 Dial Indicator Set

1. Remove tire and wheel. Refer to SECTION 3E.
2. Remove rear brake caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.
3. Install wheel nuts snugly so rotor is held tight against the rear axle.
4. Fasten J 8001 to rear brake caliper housing so that indicator button contacts rotor surface about 13 mm (0.5 inch) from rotor edge.
5. Set J 8001 to zero.
 - Push in rear axle while setting J 8001 to eliminate endplay.
6. Turn rotor (39) one complete revolution, and observe Total Indicated Runout (TIR).
 - Push in rear axle while turning rotor assembly to eliminate endplay.
 - Total Indicated Runout (TIR) should not be more than 0.10 mm (0.004 inch).
7. In some cases, excessive lateral runout of rotor (39) on-vehicle condition can be improved by indexing rotor (39).
 - Move rotor (39) on hub one or two wheel bolt positions from original position.
8. If lateral runout of rotor (39) still exceeds 0.10 mm (0.004 inch), check rear axle shaft flange for excessive lateral runout or looseness.

NOTICE: Whenever the rotor has been separated from the axle flange, clean any rust or foreign material from the mating surface of the axle flange and brake rotor. Failure to do this may result in increased lateral runout of the rotor and brake pulsation.

- A. Remove rear brake rotor. Refer to "Rear Brake Rotor" in this section.
- B. Reposition J 8001 so button contacts surface of axle shaft flange.
- C. Push axle shaft flange inward while turning the axle shaft flange one full revolution.

- D. Continue pushing in axle shaft flange while setting J 8001 to zero.
- E. While maintaining inward pressure, rotate axle shaft flange and note lateral runout.
- F. If axle shaft flange lateral runout exceeds 0.05 mm (0.002 inch), replace rear axle shaft. Refer to SECTION 4B.

- 9. If axle shaft flange lateral runout is within specifications, refinish or replace rotor as necessary. Refer to "Refinishing Rear Brake Rotors" under "Unit Repair" in this section.

REAR BRAKE CALIPER INSPECTION

The rear brake caliper must be disassembled for inspection. Refer to "Rear Brake Caliper" under "Unit Repair" in this section.

ON-VEHICLE SERVICE

NOTICE: Do not use lubricated compressed air on brake parts as damage to rubber components may result.

! Important

- Replace all components included in repair kits used to service this caliper assembly.
- Lubricate rubber parts with clean brake fluid to ease assembly.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake hydraulic system.
- Replace pads in axle sets only.
- The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench, free from all mineral oil materials.

Figure 2 - Checking Lateral Runout

REAR BRAKE CALIPER

Figures 3 through 6

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
 - Install wheel nuts to retain rotor.
3. Brake hose fitting bolt/screw (32), brake hose fitting (33) and two gaskets (34) only if caliper is being removed for overhaul.
 - A. Discard old gaskets (34).
 - B. Plug hole in caliper housing (14) and brake hose fitting (33).
4. Upper caliper guide pin bolt/screw (13) and discard.
5. Lower caliper guide pin bolt/screw (52) and discard, only if removing caliper from vehicle.
6. Caliper housing (14) from rotor (39) and anchor bracket (17).
 - If caliper overhaul or replacement is not required, hang caliper housing (14) from suspension to avoid damage to brake hose.
7. Inner and outer pads (29 and 30) only if they are being replaced or if anchor bracket (17) is being removed.

🔍 Inspect

- A. Guide pins (15) for free movement in anchor bracket (17). Replace guide pins (15) or guide pin boots (16) if corroded, worn or damaged.
- B. Inner and outer pads (29 and 30) for wear and maximum taper of 0.15 mm (0.006 inch).
 - Replace with new inner and outer pad sets (29 and 30) if they are tapered beyond specification.
- C. Brake hose fitting bolt/screw (32).
 - If through-hole in brake hose fitting bolt/screw (32) is blocked, remove blockage or replace brake hose fitting bolt/screw (32).

→→ Install or Connect

NOTICE: Refer to "Notice" on page 5B2-1 of this section.

1. Inner and outer pads (29 and 30), if removed.
 - Outer pad (30) with insulator is installed toward caliper housing (14). Inner pad (29) is installed nearest to piston (19).
2. Caliper housing (14) over rotor (39) and into anchor bracket (17).
3. New upper caliper guide pin bolt/screw (13).

🔧 Tighten

- Bolt/screw (13) to 31 N.m (23 lb. ft.).

5B2-4 REAR DISC BRAKES

4. New lower caliper guide pin bolt/screw (52), if removed.

Tighten

- Bolt/screw (52) to 31 N.m (23 lb. ft.).
5. Brake hose fitting (33), two new gaskets (34) and brake hose fitting bolt/screw (32), if removed.
-
- ### Tighten
- Brake hose fitting bolt/screw (32) to 27 N.m (20 lb. ft.).
6. Bleed brake hydraulic system, if brake hose fitting was removed. Refer to SECTION 5.
 7. Tire and wheel. Refer to SECTION 3E.
 - Remove wheel nuts securing rotor (39).
 8. Lower vehicle.
 9. With engine running, pump brake pedal slowly and firmly three times to seat inner and outer pads (29 and 30).
 10. Check brake hydraulic system for leaks.

REAR DISC BRAKE INNER AND OUTER PADS

Figures 3, 5, and 6

Remove or Disconnect

1. Two-thirds of brake fluid from master cylinder reservoir.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Tire and wheel. Refer to SECTION 3E.
 - Install wheel nuts to retain rotor.
4. Position a C-clamp and tighten until piston (19) bottoms in base of caliper housing (14).
 - Make sure one end of C-clamp rests on brake hose fitting bolt/screw (32) and other end against outer pad (30).
5. Upper caliper guide pin bolt/screw (13).
 - Discard upper caliper guide pin bolt/screw (13).
6. Inner and outer pads (29 and 30).

Figure 3 - Rear Brake Caliper Components

Figure 4 - Removing Rear Brake Hose Fitting

- A. Rotate caliper housing (14) about lower caliper guide pin bolt/screw (52) and guide pin (15). Be careful not to strain hose or cable conduit.
- B. Lift out inner and outer pads (29 and 30).
7. Rear brake pad spring shim.

Clean

- All residue from shoe guide surfaces on anchor bracket (17) and caliper housing (14).

Inspect

- Guide pins (15) for free movement in anchor bracket (17).
— Replace guide pins (15) or guide pin boots (16) if corroded or damaged. Refer to "Rear Brake Caliper" in this section.

Install or Connect

NOTICE: Refer to "Notice" on page 5B2-1 of this section.

1. Rear brake pad spring shim.
 - Spring must lay flat within groove at caliper. (14).
2. New inner and outer pads (29 and 30).
 - Outer pad (30) with insulator is installed toward caliper housing (14). Inner pad (29) is installed nearest the piston (19).
 - Replace inner and outer pads (29 and 30) in axle sets only.

Figure 5 - Compressing Rear Brake Caliper Piston

3. Rotate caliper housing (14) into its operating position.
 - Springs on inner and outer pads (29 and 30) must not stick through inspection hole in caliper housing (14). If springs are sticking through inspection hole in caliper housing (14), lift caliper housing (14) and reposition springs.
4. New upper caliper guide pin bolt/screw (13).

Tighten

- Upper caliper guide pin bolt/screw (13) to 31 N·m (23 lb. ft.).
- 5. With engine running, pump brake pedal slowly and firmly to seat inner and outer pads (29 and 30).
- 6. Tire and wheel. Refer to SECTION 3E.
 - Remove wheel nuts securing rotor (39).
- 7. Lower vehicle.
- 8. Fill master cylinder reservoir. Refer to SECTION 5A.
- 9. Pump the brake pedal until a firm pedal feel is obtained.
- 10. Burnish the rear brake rotors. Refer to "Burnishing the Rear Brake Rotors" in this section.

REAR BRAKE CALIPER ANCHOR BRACKET AND MOUNTING PLATE

Figure 7

1. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.

Important

- Remove anchor bracket (17) only if it is damaged or if rotor (39) is being removed for refinishing or other service operations.

5B2-6 REAR DISC BRAKES

Figure 6 - Rear Disc Brake Inner and Outer Pad Replacement

2. Anchor bracket bolts/screws (44).
3. Anchor bracket (17) from mounting plate (38).
4. Parking brake rear cable. Refer to SECTION 5F.
5. Rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining" in this section.
6. Rear axle shaft. Refer to SECTION 4B.
7. Bolts/screws (54), nuts (55), and washers (56).
8. Mounting plate (38) from axle housing.

Install or Connect

NOTICE: Refer to "Notice" on page 5B2-1 of this section.

1. Position mounting plate (38) to axle housing.
2. Bolts/screws (54), nuts (55), and washers (56).

Tighten

- Mounting plate nuts (55) to 48 N·m (35 lb. ft.).
3. Rear axle shaft. Refer to SECTION 4B.
 4. Rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining" in this section.
 5. Parking brake rear cable. Refer to SECTION 5F.
 6. Anchor bracket (17) to mounting plate (38).
 7. Anchor bracket bolts/screws (44).

Figure 7 - Rear Brake Rotor, Caliper Anchor Bracket, and Mounting Plate

Tighten

- Anchor bracket bolts/screws (44) to 100 N.m (74 lb. ft.).
8. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.

REAR BRAKE ROTOR

Figure 7

Rear brake rotor can be removed without removal of caliper from anchor bracket.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Anchor bracket bolts/screws (44).
4. Anchor bracket (17) with assembled caliper from mounting plate (38) and suspend them from rear suspension out of the way using locally fabricated wire hook.
5. Rotor (39).
 - Slowly turn rotor (39) while pulling away from axle.

NOTICE: Refer to "Notice" on page 5B2-1 of this section.

NOTICE: Whenever the rotor has been separated from the axle flange, clean any rust or foreign material from the mating surface of the axle flange and brake rotor. Failure to do this may result in increased lateral runout of the rotor and brake pulsation.

1. Rotor (39).
2. Anchor bracket (17) with assembled caliper to mounting plate (38).
3. Anchor bracket bolts/screws (44).

Tighten

- Anchor bracket bolts/screws (44) to 100 N.m (74 lb. ft.).
4. Tire and wheel. Refer to SECTION 3E.
 5. Lower vehicle.
 6. Burnish rear brake rotors, if replaced. Refer to "Burnishing the Rear Brake Rotors" in this section.

REAR PARKING BRAKE SHOE AND LINING

Figure 7 and 8

Remove or Disconnect

1. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.
2. Rotor. Refer to "Rear Brake Rotor" under "On-Vehicle Service" in this section.

Figure 8 - Rear Parking Brake Components

5B2-8 REAR DISC BRAKES

3. Slide shoe and lining (47) downward from actuator (49).

Install or Connect

1. Open end of shoe and lining (47) through rear axle shaft (50).
2. Slide shoe and lining (47) upward into actuator (49).

Important

- Make sure shoe and lining (47) engages clip (51).

Adjust

- Rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining Adjustment" in this section.
3. Rotor. Refer to "Rear Brake Rotor" under "On-Vehicle Service" in this section.
 4. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.

REAR PARKING BRAKE SHOE AND LINING ADJUSTMENT

Figure 8

Tool Required:
J 21177-A Drum-to-Brake Shoe Clearance Gage

Remove or Disconnect

1. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.
2. Rotor.
 - Slowly turn rotor while pulling away from axle.
3. Loosen parking brake cable adjusting nut until lever (4) is at its "at rest" position.

Adjust

1. Rear parking brake shoe and lining (47).
 - A. Set J 21177-A so that it contacts inside diameter of rotor.
 - B. Position J 21177-A over shoe and lining (47) at its widest point.
 - C. Turn adjuster nut (9) until shoe and lining (47) just contacts J 21177-A.
 - D. Repeat procedure for opposite side.
2. Rear parking brake cable. Refer to SECTION 5F.

Install or Connect

1. Rotor.
 - Slowly turn rotor while sliding onto axle.
2. Caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.

UNIT REPAIR

REFINISHING REAR BRAKE ROTORS

Important

- DO NOT refinish rotors when performing routine brake maintenance such as replacing worn rear disc brake inner and outer pads. Refinish a rotor ONLY under the following circumstances:
 - There is a complaint of brake pulsation.
 - There is scoring greater than 1.5 mm (0.060 inch).

All rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum refinish dimension is greater than the discard dimension. Do not use a rotor that will not meet specifications. A rotor that has been refinished too thin will not have proper heat transfer capabilities. Replace with a new rotor. Refer to "Specifications" in this section.

Since accurate control of the rotor tolerances is necessary for proper performance of the rear disc brakes, the rotor should be machined only with precision equipment. Equipment should be serviced on a regular basis following the manufacturer's recommended maintenance procedure. When refinishing rotors, the attaching adapters, tool holders, vibration dampeners and tool bits must be in good condition. Always use sharp cutting tools or bits and use only replacement cutting bits recommended by the equipment manufacturer. Dull or worn tools leave a poor surface finish which will affect braking performance and possibly cause brake chatter while machining. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments help eliminate tool chatter and will result in better surface finish. Make sure these adapters are clean and free of nicks.

On-Vehicle

Tools Required:

J 37704 On-Vehicle Brake Lathe or equivalent

In the cases where rotors are being refinished to correct a problem with brake pulsation, it is recommended that an on-vehicle brake lathe be used to achieve best results. Follow the equipment manufacturer's recommended specifications and procedure.

Off-Vehicle

Figure 9

Tool Required:

J 39144 Brake Rotor Mounting Adapter

Important

- Remove rust and scale from rotor and rear axle shaft flange mating surfaces. Failure to do so may introduce excessive lateral runout when the rotor is mounted on the brake lathe, or when the rotor is reinstalled on the rear axle shaft flange.

Assemble

1. Brake rotor to J 39144 brake rotor adapter.
 - A. Install spacer to adapter first.
 - B. Set brake rotor top of adapter and spacer.
 - C. Install 1 1/2 inch long, 1/2 NC bolts/screws with washers through rotor, spacer and into adapter.

Important

- Do not use the bolts/screws supplied with J 39144. They are too short, and are likely to strip out when torque is applied. Obtain correct length bolts/screws from a local hardware store.

Tighten

- Rotor-to-adapter bolts screws to 140 N.m (100 lb. ft.).

Following are two recommended procedures that achieve adequate results using two different off-vehicle drum/disc brake lathes. (If any other lathe is used, follow that lathe's instructions and recommendations).

Accuturn Brake Lathe, GM Dealer Equipment

(One-cut refinishing procedure)

Locate the deepest score and turn the tool bit micrometer knob until the tool bit bottoms out at the deepest point of the score. Zero the scale and back out

the tool bit (repeat for opposite side of rotor). Advance the cutter handwheel until the bits have cleared the inner edges of the rotor face. Adjust the micrometer knobs for approximately 0.13 mm (0.005 inch) more than the first reading. This will ensure resurfacing the rotor in one cut.

- Spindle Speed 105 rpm
- Depth of Cut As necessary
- Tool Cross Feed 0.08 mm (0.003 inch) per rev.
- Tool Bit Nose Radius 1/64
- Vibration Dampener Yes
- Non-Directional Finishing Yes

Ammco Brake Lathe

(Two-cut refinishing procedure)

1. Rough cut.
 - Spindle Speed 150 rpm
 - Depth of Cut (per side) 0.15 - 0.64 mm (0.006 - 0.025 in.)
 - Tool Cross Feed (Per Revolution) 0.25 mm (0.010 in.)
 - Vibration Dampener Yes
 - Sand Rear Brake Rotor (Swirl Pattern) No
2. Finish Cut.
 - Spindle Speed 150 rpm
 - Depth of Cut (Per Side) .. 0.010 - 0.015 mm (0.004 - 0.006 in.)
 - Tool Cross Feed (Per Rev.) 0.05 mm (0.002 in.)
 - Sand Brake Rotor (Swirl Pattern) Yes

- A BOLT/SCREW, 1 1/2 INCH LONG, 1/2 NC
- B WASHER
- 39 ROTOR, REAR BRAKE

05-13-95
BT0115B2

Figure 9 - Mounting Rear Brake Rotor on Adapter

5B2-10 REAR DISC BRAKES

Non-Directional Finishing

It is very important that the rotor surface be made non-directional by dressing the rotor surfaces with a sanding disc tool such as Accuturn 433179 Non-Directional Swirl Finisher, Ammco 8750 Safe Swirl Disc Rotor Grinder, or equivalent, using 120 grit aluminum oxide sandpaper. Sand each rotor surface with moderate pressure for a minimum of 60 seconds. If the brake lathe is not equipped with an adequate non-directional finishing tool, an alternate method is to use a sanding block with 150 grit aluminum oxide sandpaper. With the rotor turning at the equipment manufacturer's highest recommended cutting speed, sand each rotor surface for a minimum of 60 seconds using moderate pressure. After the rotor has been sanded, clean each surface with denatured alcohol or a suitable brake cleaner. The finished rotor surface should be as close to that of a new rear brake rotor as possible. Failure to obtain the best possible finish may affect braking performance.

Important

- Rear brake rotors should always be replaced if turning will result in a rear brake rotor that does not meet manufacturer specifications for minimum thickness. When installing new brake rotors, do not refinish the surfaces of these parts. New brake rotors have the correct level of surface finish.

Burnishing Rear Brake Rotors

After rear brake pads have been replaced and/or rotors have been refinished, it is very important that the new braking surface be broken in, or burnished. This can be accomplished by making 20 stops from 48 km/h (30 mph), using medium to firm brake pedal pressure. Take care to avoid overheating the brakes.

Refinishing Rear Brake Rotor Parking Brake Surface

The rear brake rotor parking brake contact surface should not be refinished. If the parking brake system cannot effectively hold the vehicle and all other parking brake components are functioning properly, replace the rotor.

REAR PARKING BRAKE ACTUATOR

Figure 8

Disassemble

1. Remove rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining" in this section.
2. Remove parking brake cable from lever (4).
 - Loosen equalizer enough to provide adequate clearance.
3. Bolts/screws (1).
4. Retainer (2) and boot (3).
5. Adjuster screw (10) and nut (9).

6. Tappet (5).
7. Pushrod (8).
 - Use a magnet to remove pushrod (8) from actuator (49).
8. Lever (4).

Clean

- All parts with a clean dry shop cloth.

Inspect

- All parts for excessive wear, cracks or other changes. Replace parts as needed.

Assemble

1. Lubricate all moving parts with Lubriplate® P/N 1050109.
2. Lever (4).
3. Pushrod (8).
 - Fully seat pushrod (8) into actuator (49).
4. Tappet (5).
5. Adjuster screw (10) and nut (9).
6. Boot (3) and retainer (2).
7. Bolts/screws (1).
 - Tighten snugly.
8. Install rear parking brake cable to lever (4).
9. Install rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining" in this section.

Adjust

- A. Rear parking brake shoe and lining. Refer to "Rear Parking Brake Shoe and Lining Adjustment" in this section.
- B. Rear parking brake cable. Refer to SECTION 5F.

REAR BRAKE CALIPER

Figures 3 and 9

Disassemble

1. Remove caliper. Refer to "Rear Brake Caliper" under "On-Vehicle Service" in this section.

CAUTION: Do not place fingers in front of the piston in an attempt to catch or protect it when applying compressed air. The piston can fly out with force and could result in serious injury.

Important

- Use clean shop towels to pad the inside of the caliper housing (14) during rear brake caliper piston removal.

NOTICE: To prevent damage, be careful when handling rear brake caliper piston.

2. Piston (19) by directing dry, filtered compressed air into brake hose port of caliper housing (14).

Clean

- Piston (19) for scoring, nicks, corrosion and wear.
- Replace piston (19) if necessary.

NOTICE: Do not use a metal tool to remove piston seal. Metal tools may damage the caliper housing bore or the piston seal groove.

3. Piston seal (18).
 - Use small wood or plastic tool.
4. Bleeder valve cap (7) and bleeder valve (6).
 - Discard bleeder valve cap (7).

Clean

- Pad contact area on anchor bracket (17).
5. Two guide pins (15) and guide pin boots (16) from anchor bracket (17).

Inspect

- All parts for excessive wear, cracks or other changes. Replace parts as needed.

Clean

- A. All parts not included in repair kit in denatured alcohol.
- B. Use dry, filtered compressed air to dry parts.
- C. Blow out all passages in caliper housing (14) and bleeder valve (6).

Inspect

- Caliper housing bore for scoring and corrosion. Replace caliper housing (14) if badly scored or corroded around seal area.

Figure 10 - Removing Rear Brake Caliper Piston

Assemble

NOTICE: Refer to “Notice” on page 5B2-1 of this section.

1. Lubricate new piston seal (18) and caliper housing bore seal groove with silicone grease or clean brake fluid.
2. New piston seal (18) into caliper housing seal groove.
 - Make sure piston seal (18) is not twisted.
3. Lubricate bore of caliper housing (14) and piston (19) with clean brake fluid.
4. Piston (19) into bore of caliper housing (14).
 - Work lip of piston seal (18) over piston (19) using a small wood or plastic tool.
 - Push down by hand to bottom of bore.

SPECIFICATIONS

GENERAL SPECIFICATIONS

- Rear Brake Caliper Housing Bore Diameter.....54mm (2.126 inch)
- Rear Brake Rotor
 - Rotor Diameter (Nominal) 295 mm (11.614 inch)
 - Lateral Runout:
 - A. Rear Brake Rotor (On-Vehicle)..... 0.10 mm (0.004 inch)
 - B. Rear Axle Shaft Flange 0.05 mm (0.002 inch)
 - Thickness Variation..... 0.013 mm (0.0005 inch)
 - Rotor Thickness (Maximum) 20.00 mm (0.787 inch)
 - A. Minimum Thickness After Refinish..... 19.64 mm (0.735 inch)
 - B. Discard Thickness 18.50 mm (0.728 inch)

All rear brake rotors have a discard dimension cast into them. This is a wear dimension and not a refinish dimension. Any rear brake rotor which does not meet this specification should be replaced.

ROTOR REFINISHING SPECIFICATIONS

Ammco Brake Lathe

1. Rough Cut
 - Spindle Speed150 rpm
 - Depth of Cut (Per Side)..... 0.15 mm to 0.64 mm (0.006 to 0.025 inch)
 - Tool Crossfeed (Per Rev.)..... 0.25 mm (0.010 inch)
 - Vibration Dampener..... Yes
 - Sand Brake Rotor (Swirl Pattern)No
2. Finish Cut
 - Spindle Speed150 rpm
 - Depth of Cut (Per Side)..... 0.10 mm to 0.15 mm (0.004 to 0.006 inch)
 - Tool Crossfeed (Per Rev.)..... 0.05 mm (0.002 inch)
 - Vibration Dampener..... Yes
 - Sand Brake Rotor (Swirl Pattern) Yes

Accuturn Brake Lathe

1. Single Cut Refinishing
 - Spindle Speed105 rpm
 - Depth of Cut..... As necessary
 - Tool Crossfeed (Per Rev.)..... 0.08 mm (0.003 inch)
 - Vibration Dampener..... Yes

SECTION 5C2

DUO-SERVO DRUM BRAKES

CAUTION: When servicing brake parts, do not create dust by grinding, sanding brake linings, or by cleaning brake parts with a dry brush or compressed air. Many brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm. A water dampened cloth or water based solution should be used to remove any dust on brake parts. Equipment is commercially available to perform this washing function. These wet methods will prevent asbestos fibers from becoming airborne.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact - rinse thoroughly with water.
- Skin contact - wash with soap and water.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen damage.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The rear brake system is a duo-servo design. In the duo-servo brake, the force which the rear wheel cylinder applies to the rear brake primary shoe is multiplied by the primary lining friction to provide a

very large force, which is applied to the rear brake secondary shoe. Torque from the brake shoes is transferred to the anchor pin, through the rear brake backing plate and to the axle flange. Adjustment for both the rear brake primary and secondary shoe and linings is automatic during reverse brake applications.

DIAGNOSIS

PRIMARY AND SECONDARY SHOES INSPECTION

When the thickness of any lining is worn within 0.76 mm (0.030 inch) of the primary or secondary shoe rivets, the primary and secondary shoes must be replaced. Replace shoes in axle sets only.

REAR BRAKE DRUM INSPECTION

Pulsation in the brake pedal is usually corrected by servicing the front brakes. Service the rear brakes only if the problem persists. To determine if the front or rear brakes are at fault, drive the vehicle in an area away from people and moving traffic (such as in a large parking lot), and at a slow speed, apply the parking brake and feel for the pulsation. If the pulsation is not noticed, the fault is probably in the front brakes.

When drums are removed, thoroughly clean and inspect them for cracks, scores, deep grooves, out-of-round and taper.

Surface Finish

Normal light scoring of the drum surfaces not exceeding 0.51 mm (0.020 inch) in depth will not affect brake operation.

Inside Diameter Check

The nominal inside diameter of the drum is 279.00 mm (11.000 inches). Refer to "Specifications" for maximum refinish diameter and discard diameter.

Out-of-Round or Taper Check

An out-of-round or tapered drum makes accurate primary or secondary shoe adjustment impossible and is likely to cause excessive wear of other parts of brake mechanism due to its eccentric action. An out-of-round drum can also cause severe and irregular tire tread wear as well as a pulsating brake pedal. When the drum exceeds the specification limits in taper and/or out-of-round, refinish drum to true up the braking surface. Out-of-round as well as taper and wear can be accurately measured with an inside micrometer fitted with proper extension rods.

When measuring a drum for out-of-round, taper, and wear, take measurements at the open and closed edges of machined surface and at right angles (90 degrees) to each other.

Runout Check

Runout for drums is not to exceed 0.15 mm (0.006 inch).

Balance

During manufacture, weights are used to balance drums. These weights must not be removed. After drums have been refinished or if difficulty is experienced in maintaining proper wheel balance, drums should be checked for balance. Drums may be checked for balance on most off-the-vehicle wheel balancers.

ON-VEHICLE SERVICE

Important

- Replace all components included in repair kits used to service this rear brake system.
- Lubricate parts as specified.
- Do not use lubricated shop air on brake parts as damage to rubber components may result.
- If any hydraulic component is removed or disconnects, it may be necessary to bleed all or part of the brake hydraulic system.
- Replace shoe and linings in axle sets only.
- The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench free from all mineral oil materials.

REAR BRAKE DRUM

Figure 1

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Drum.
 - Mark the relationship of the drum to the axle flange.
 - If you have trouble removing the rear brake drum, try the following:
 - A. Make sure the parking brake is released.
 - B. Back off the parking brake cable adjustment. Refer to SECTION 5F.
 - C. Remove the adjusting hole plug or knockout from the plate (29) and back off the adjusting screw using a screwdriver and a brake adjusting tool.
 - D. Use a rubber mallet to tap gently on the outer rim of the drum and/or around the inner drum diameter by the spindle. Take care not to deform the drum by excessive use of force.

Install or Connect

Adjust

- Rear brake. Refer to "Rear Brake Adjustment" in this section.
1. Drum.
 - Align locating marks on drum and axle flange.
 - If the knockout in plate (29) was removed, an adjusting hole cover, GM P/N 5464803, must be installed.
 2. Tire and wheel. Refer to SECTION 3E.

Adjust

- Parking brake rear cable. Refer to SECTION 5F.

Figure 1 - Backing Off Rear Brake Shoe Adjustment

PRIMARY AND SECONDARY SHOES

Figures 2 and 3

Tools Required:

- J 8049 Brake Spring Remover and Installer
- J 8057 Brake Spring Pliers

Remove or Disconnect

1. Rear brake drum. Refer to "Rear Brake Drum" under "On-Vehicle Service" in this section.

CAUTION: Keep fingers away from rear brake shoe return springs to prevent fingers from being pinched between rear brake shoe return spring and shoe web or return spring and backing plate.

2. Springs (1 and 2) using J 8049.
3. Hold down springs (3) and pins (5) using suitable pliers.
4. Pivot (4).

5. Link (6) while lifting up on actuator (7).
6. Actuator (7), pawl (8), if equipped, and spring (9).
7. Guide (10), strut (11) and spring (12).
8. Primary shoe (13) and secondary shoe (14) from plate (29) and parking brake rear cable.
9. Adjuster (31) and spring (15).
10. Lever (20).
 - Unhook lever tab from slot in primary or secondary shoe (13 or 14).

Clean

1. Adjuster (31).
 - Clean adjuster threads with a wire brush.
 - Wash all components in clean denatured alcohol.
 - Apply brake lubricant GM P/N 1052196 or equivalent to the adjuster threads, inside diameter of socket (16) and socket face.
 - Adequate lubrication is achieved when a continuous bead of lubricant is at open end of nut (18) and socket (16) when threads are fully engaged.
2. Plate (29) and lubricate contact surfaces with brake lubricant GM P/N 1052196 or equivalent.

Inspect

1. Threads of adjuster (19) for smooth rotation over full length.
2. All parts.
 - If any parts are of questionable strength or quality due to discoloration from heat, over-stress, or wear, the parts should be replaced.

Install or Connect

1. Lever (20).
 - Hook lever tab into slot in primary or secondary shoe (13 or 14).
2. Adjuster (31) and spring (15).
3. Primary and secondary shoe (13 and 14) to parking brake rear cable and plate (29).
4. Strut (11) and spring (12) by spreading primary and secondary shoes (13 and 14) apart.
 - The end without spring (12) engages the lever (20) and primary or secondary shoe (13 or 14).
 - The end with the spring (12) engages the opposite primary or secondary shoe (13 or 14).
5. Guide (10).
6. Pawl (8), if equipped, actuator (7) and spring (9).
7. Pins (5), pivot (4) and springs (3).
 - Use pliers or tool suitable to lock springs (3) onto pins (5).
8. Link (6) on anchor pin.
9. Link (6) into actuator (7) while holding up on actuator (7).
10. Springs (1 and 2) using J 8057.
11. Rear brake drum. Refer to "Rear Brake Drum" under "On-Vehicle Service" in this section.

Tool Required:

J 21177-A Drum-to-Brake Shoe Clearance
Gage

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tires and wheels. Refer to SECTION 3E.
3. Rear brake drum. Refer to "Rear Brake Drum" under "On-Vehicle Service" in this section.

Adjust

- Rear brakes.
 - A. Set J 21177-A so that it contacts the inside diameter of the drum (33).
 - B. Position J 21177-A over the primary and secondary shoes (13 and 14).
 - C. Turn the star wheel on the adjuster (19) until the primary and secondary shoes (13 and 14) contact J 21177-A.
 - D. The outside diameter of the primary and secondary shoes (13 and 14) will be approximately 1.27 mm (0.050 inch) less than the inside diameter of the drum (33) on each wheel.

Figure 6 - Setting Rear Brake Primary and Secondary Shoes to Tool

**Install or Connect**

1. Drum (33).
 - Align locating marks on drum (33) and axle flange.
2. Tires and wheels. Refer to SECTION 3E.
3. Lower vehicle.
4. Make several alternate forward and reverse stops applying firm force to the brake pedal. Repeat until ample pedal reserve is built up.

UNIT REPAIR**REAR BRAKE DRUM****Cracked, Scored or Grooved**

A cracked drum is unsafe for further service and must be replaced. Do not attempt to weld a cracked drum. Smooth up any slight scores. Heavy or extensive scoring will cause excessive brake lining wear, and it may be necessary to refinish the drum braking surface.

If the brake linings are slightly worn, but still reusable, and the drum is grooved, polish the drum with fine emery cloth but do not refinish. Eliminating all grooves in drum and smoothing the ridges on lining would require removing too much metal and lining, while if left alone, the grooves and ridges match and satisfactory service can be obtained. If brake linings are to be replaced, refinish a grooved drum. A grooved drum, if used with new lining, will not only wear the lining, but will make it difficult, if not impossible, to obtain proper brake performance.

Out-Of-Round or Tapered

An out-of-round or tapered drum prevents accurate rear brake shoe adjustment and is likely to cause excessive wear of other brake parts due to its eccentric action. An out-of-round drum can also cause severe and irregular tire tread wear as well as a pulsating brake pedal. When the drum exceeds the specification limits in taper and/or out-of-round, refinish the drum to true up the braking surface. Out-of-round as well as taper and wear can be accurately measured with an inside micrometer and extension rods. When measuring a drum for out-of-round, taper and wear, take measurements at the open and closed edges of the machined surface and at right angles (90 degrees) to each other.

Refinishing

All drums have a maximum diameter cast into them. This diameter is the maximum wear diameter and not a refinish diameter. Do not refinish a drum that will not meet the specifications. Refer to "Specifications" at the end of this section. Any drum that does not meet specifications shown should be replaced.

When refinishing a drum, resurface the drum to no more than a dimension of 0.76 mm (0.030 inch) less than the discard diameter. The refinish diameter is the maximum diameter the drum should be refinished

to, and still allow safe braking action. If this dimension is exceeded, the drum will wear beyond the discard diameter during normal brake wear.

If a drum must be refinished, remove only enough metal to obtain a true, smooth braking surface. If a drum does not clean-up when refinished to a maximum rebore diameter as shown at the end of this section, replace it. Removal of more metal will affect heat dissipation and may cause rear brake drum distortion.

When refinishing drums, always use sharp cutting tools or bits. Dull or worn tools leave a poor surface finish which will affect initial braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish. The optimum spindle speed for refinishing braking surfaces is 200 rpm. Crossfeed for rough cutting should range from 0.15-0.25 mm (0.006-0.010 inch) per revolution. Finish cuts should be made at crossfeeds no greater than 0.05 mm (0.002 inch) per revolution.

Replacing Drums

When installing new drums, do not refinish the braking surface. New drums have the correct level of surface finish.

Balance

During manufacture, weights are used to balance drums. Do not remove these weights. After drums are refinished, or when maintaining wheel balance is difficult, check the drums for balance. They can be checked on most off-vehicle balancers. If found to be out of balance, replace drum.

REAR WHEEL CYLINDER**Figure 7****Disassemble**

1. Boots (23).
2. Pistons (24) and seals (25).
3. Spring (26).
4. Valve (27) from body (28).

**Inspect**

- Rear wheel cylinder bore for scoring, nicks, corrosion and wear.
 - Use crocus cloth to polish out light corrosion.
 - Replace cylinder if bore will not clean up with crocus cloth.
- Pistons (24) for scoring, nicks, corrosion and wear.

**Clean**

- All parts in clean denatured alcohol.
- Dry with unlubricated compressed air.
- Lubricate new seals (25) with clean brake fluid.

Power Brake Booster	5D1-1	Special Tools	5D1-5
Exterior Components.....	5D1-3		

GENERAL DESCRIPTION

POWER BRAKE BOOSTER

The power brake booster is a tandem vacuum suspended unit. In a normal operating mode, with the service brakes in the released position, the tandem vacuum suspended booster operates with vacuum on both sides of its diaphragms. When the brakes are applied, air at atmospheric pressure is admitted to one side of each diaphragm to provide the power assist. When the service brake is released, the atmospheric air is shut off from one side of each diaphragm. The air is then drawn from the booster through the power brake booster vacuum check valve to the vacuum source. The internal components of the booster are non-serviceable and non-interchangeable.

ON-VEHICLE SERVICE

 Important

- Replace all components included in repair kits used to service this booster.
- Lubricate rubber parts with silicone grease, provided in kits, to ease installation.
- Do not use lubricated shop air on brake parts as damage to rubber parts may result.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench free from all mineral oil materials.

POWER BRAKE BOOSTER

Figure 1

 Remove or Disconnect
 Important

- It is not necessary to remove or disconnect the master cylinder from the vehicle in order to remove the vacuum booster. However, if both the vacuum booster and master cylinder are to be removed, remove the master cylinder first, as described in SECTION 5A.

1. Left-hand sound insulator panel. Refer to SECTION 8C.
2. Hose (5) from valve (3).
3. Two nuts (37).
4. Valve (39) and cylinder (36) from booster (35).
 - Move master cylinder forward just enough to clear studs on vacuum booster. This will flex brake pipes slightly. Take care not to bend or distort brake pipes.
5. Four nuts (34).
6. Retainer (42), outer washer (43), pushrod (32) and inner washer (44) from pedal (45).
7. Daytime running lamp (DRL) diode, if equipped. Refer to SECTION 8C.
8. Booster (35) and gasket (40), if necessary.

5D1-2 VACUUM BOOSTER SYSTEM

- A BRAKE PEDAL PUSHROD ASSEMBLY PIN
- 3 VALVE, POWER BRAKE BOOSTER VACUUM CHECK

Install or Connect

CAUTION: When replacing the power brake booster, make sure that the accelerator control and cruise control cable is not routed between the booster and the cowl. If the accelerator control and cruise control cable is damaged or pinched, it **MUST** be replaced. Failure to do this could result in possible personal injury.

NOTICE: Refer to "Notice" on page 5D1-1 of this section.

1. Position gasket (40) over studs on booster (35), if removed.
2. Booster (35).
 - Mounting surface must be free of sealant or any other foreign material.
3. Inner washer (44), pushrod (32), outer washer (43) and retainer (42) to pedal (45).
 - Lubricate brake pedal pin before installing inner washer (44).

4. Daytime running lamp (DRL) diode, if removed. Refer to SECTION 8C.

5. Four nuts (34).

Tighten

- Nuts (34) to 25 N·m (18 lb. ft.).
6. Valve (39) and cylinder (36) to booster (35).
 7. Two nuts (37).

Tighten

- Nuts (37) to 25 N·m (18 lb. ft.).
8. Hose (5) to valve (3).
 9. Left-hand sound insulator panel. Refer to SECTION 8C.

Exterior Components

Figure 2

Remove or Disconnect

1. Valve (3) and grommet (4).
2. Booster. Refer to "Power Brake Booster" under "On-Vehicle Service" in this section.
3. Boot (1) and filter (2).
4. Seal (7).

Inspect

- Boot (1), seal (7), and grommet (4) for cuts, nicks, and excessive wear.
— Replace any defective part.

Clean

- Boot (1), seal (7), and grommet (4) in clean denatured alcohol.
— Dry with unlubricated compressed air.

Install or Connect

1. Lubricate inside and outside diameters of grommet (4) and seal (7) with thin layer of silicone grease GM P/N 12345579 or equivalent.
2. Seal (7).
3. Filter (2) and boot (1).
4. Booster. Refer to "Power Brake Booster" under "On-Vehicle Service" in this section.
5. Grommet (4) and valve (3).

Figure 2 - Exterior Components

PUSHROD GAGING PROCEDURE

Figure 4

Tool Required:

J 37839 Pushrod Height Gage

1. Gage booster with 85 kPa (25 in. Hg) vacuum.
 - Booster can be gaged without being installed on vehicle by using either a suitable vacuum source or maximum vacuum available from engine.
2. After booster has been assembled, position J 37839 over pushrod (12).
 - Check both maximum and minimum pushrod length.
3. If pushrod length does not fall between maximum and minimum dimensions, replace booster.
 - Pushrod and output button (12) cannot be interchanged from booster to booster.

VACUUM HOSE

Figure 3

Remove or Disconnect

1. Air cleaner resonator. Refer to SECTION 6E3.
2. Clamps (49).
 - Squeeze clamps and slide inboard.
3. Hose (5) from engine and vacuum check valve (3).

Install or Connect

NOTICE: Refer to "Notice" on page 5D1-1 of this section.

1. Hose (5) to engine and vacuum check valve (3).
2. Clamps (49).
 - Squeeze clamps and slide into position.
3. Air cleaner resonator. Refer to SECTION 6E3.

SECTION 5E1

ANTILOCK BRAKE SYSTEM (ABS)

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Brake fluid may irritate eyes and skin. In case of contact, take the following actions: Eye contact - rinse thoroughly with water. Skin contact - wash with soap and water.

CAUTION: Certain components in the Antilock Brake System (ABS) are not intended to be serviced individually. Attempting to remove or disconnect certain system components may result in personal injury and/or improper system operation. Only those components with approved removal and installation procedures should be serviced.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring, cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, flush the area with water to lessen the damage.

GENERAL DESCRIPTION

The purpose of the Antilock Brake System (ABS) is to minimize wheel lockup during heavy braking on most road surfaces. The ABS performs this function by monitoring the speed of each wheel and controlling the brake fluid pressure to individual front wheels and both rear wheels simultaneously during a braking maneuver. This allows the driver to retain directional stability and better steering capability.

ABBREVIATIONS/DEFINITIONS

Several abbreviations are commonly used throughout this section. They are presented here for reference.

ABS	Antilock Brake System
B+	Battery Voltage
BPMV	Brake Pressure Modulator Valve
CKT	Circuit
DLC	Data Link Connector
DTC	Diagnostic Trouble Code
DVM	Digital Volt Meter
EBCM	Electronic Brake Control Module
MSC	Mass Storage Cartridge
PCM	Power Train Control Module
WSS	Wheel Speed Sensor

BASIC KNOWLEDGE REQUIRED

Before using this section, it is important that you have a basic knowledge of the following items. Without this basic knowledge, it will be difficult to use the diagnostic procedures contained in this section.

- Basic electrical circuits - You should understand the basic theory of electricity and know the meaning of voltage, current (amps) and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You should be able to read and understand a wiring diagram.
- Use of circuit testing tools - You should know how to use a test light and how to use jumper wires to bypass components to test circuits. You should be familiar with the Digital Volt Meter (DVM) J 39200. You should be able to measure voltage, resistance and current and be familiar with the meter controls and how to use them correctly.
- Sources of additional information - If you need a review of basic electrical troubleshooting knowledge, SECTION 8A of this service manual contains helpful information in the introduction. Basic use of circuit testing tools is also covered in SECTION 8A.

SYSTEM OPERATION

Normal Braking

Using a front-rear split brake orientation and an add-on type ABS unit, the system operates normally while the ABS monitors wheel speeds. The foundation

brakes continue to operate normally until the EBCM detects a wheel beginning to lock. When this wheel locking condition exists, the brake system transfers from normal braking mode to antilock braking modes. The ABS remains in control until braking is no longer required, or the wheel locking conditions cease to exist.

Antilock Braking

When a Wheel locking condition exists, the Brake Pressure Modulator Valve (BPMV), controlled by the EBCM, isolates each individual wheel hydraulic circuit and begins modulating fluid pressure to each wheel using the ABS modes: pressure hold, pressure reduce, and pressure increase. The EBCM allows the BPMV to individually adjust each wheel's hydraulic pressure according to wheel speed input signals.

The BPMV has two solenoid valves per circuit, a normally open inlet and a normally closed outlet valve. These valves work in pairs to achieve the three ABS modes. The ABS system in reality isolates, monitors and controls all wheels simultaneously. The following descriptions explain the hydraulic control of a circuit during ABS braking.

PRESSURE INCREASE

The pressure increase position is the valve position for normal (non-ABS) braking. The EBCM does not energize either valve, leaving the inlet valve open and the outlet valve closed.

PRESSURE HOLD

The pressure hold position occurs when the EBCM first notices an impending wheel lockup condition, or excess hydraulic brake pressure at the locking wheel. The EBCM closes the corresponding inlet valve to avoid any additional hydraulic pressure increase at the wheel.

PRESSURE REDUCE

During a wheel lockup condition, the EBCM closes the inlet valve while opening the outlet valve. This decreases hydraulic pressure at a specific wheel without decreasing over all system pressure. The reduced hydraulic pressure allows greater wheel rotation, eliminating the wheel lockup condition.

Warning System Operation

The Electronic Brake Control Module (EBCM) continuously monitors all of its components and uses several methods of determining a fault and notifying the driver of a system malfunction. When the vehicle is started, a functional check of the ABS electrical circuitry is performed. As the vehicle speed reaches 6 km/h (4 mph) (15km/h (10mph) with the brake applied), a functional check of the Brake Pressure Modulator Valve (BPMV) takes place. During this check each valve is cycled and the pump motor is

turned on briefly. The driver may hear and feel this check take place when the vehicle begins to move. This test will occur only once per ignition cycle and should be considered normal operation.

Two methods are used to inform the driver that a malfunction has occurred in the brake system. The "BRAKE" warning lamp and the "ABS" indicator lamp, both located in the instrument cluster, will notify the driver if a problem exists in the brake system or with the antilock portion of the brake system. Their operation is described below.

"BRAKE" WARNING LAMP

The "BRAKE" warning lamp in the instrument cluster will illuminate to warn the driver of abnormal conditions in the brake system. Conditions which turn on the "BRAKE" warning lamp include the following:

1. Parking brake lever not fully released. If the parking brake lever is applied or not fully released, the parking brake switch located on the parking brake lever will ground the "BRAKE" lamp circuit and cause the light to turn on.
2. Unequal pressure in the two circuits of the hydraulic brake system. The combination valve contains a brake pressure differential warning switch which senses when unequal pressures exist between the two hydraulic circuits. When a difference of pressures is detected, the brake pressure differential warning switch will ground the "BRAKE" warning lamp circuit and turn on the light. This difference in pressures may be caused by low brake fluid or a leak in one of the hydraulic circuits. The "BRAKE" warning lamp will stay illuminated until the condition has been repaired. Refer to SECTION 5.
3. Instrument panel bulb check. When the ignition is turned to "START" the "BRAKE" warning lamp will turn on. The "BRAKE" warning lamp should turn off with the ignition switch in the "RUN" position.

"ABS" INDICATOR LAMP

The "ABS" indicator lamp is also located in the instrument cluster and will illuminate if a malfunction in the ABS is detected by the Electronic Brake Control Module (EBCM). The "ABS" indicator lamp informs the driver that a condition exists which results in disabling the antilock brake function. If only the "ABS" indicator lamp is on, normal braking with full power assist is available. If the "BRAKE" and "ABS" lamps are on, a problem may exist in the hydraulic brake system. Refer to SECTION 5. Conditions for the "ABS" indicator lamp to turn on are as follows:

1. ABS malfunction detected. As previously described the "ABS" indicator lamp turns on when a problem has been found in the ABS. The "ABS" indicator lamp indicates that the ABS has been disabled.
2. Instrument panel bulb check. When the ignition is turned to "RUN", the "ABS" indicator lamp will turn on for approximately two seconds and then

turn off. The "ABS" indicator lamp should turn off with the engine control switch in the "RUN" position.

! Important

- Illumination of the "BRAKE" warning lamp may indicate reduced braking ability.
- Illumination of the "ABS" indicator lamp without the "BRAKE" warning lamp on indicates only that antilock braking is no longer available. Power assisted braking without antilock control is still available.
- Refer to SECTION 5 for diagnosis of any condition which causes the "BRAKE" warning lamp to illuminate.
- Refer to "Diagnosis" in this section for any condition that causes the "ABS" indicator lamp to illuminate.

Tires and Antilock Brake System

SPARE TIRE

When using the compact spare tire, it will rotate faster than the other tires. Under most conditions the EBCM will compensate for this faster rotation so the ABS will not deactivate. It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause a wheel speed fault.

REPLACEMENT TIRES

For information on replacement tires for this vehicle, refer to SECTION 3E. Always use tires of the same type and size or the ABS may deactivate.

SYSTEM COMPONENTS

Figure 1

Brake Pressure Modulator Valve (BPMV)

The ABS Brake Pressure Modulator Valve (BPMV) is mounted to the left front frame rail near the steering gear. The modulator controls brake fluid pressure to each of the front wheel circuits, and a rear circuit which controls both rear brakes. These three circuits are individually controlled, as commanded by the Electronic Brake Control Module (EBCM), during antilock braking. The front and rear circuits are also hydraulically isolated so that a leak in one circuit will allow continued braking on the other circuit. During antilock mode, the BPMV can increase, maintain or reduce brake fluid pressure, however, it cannot apply the brakes or increase pressure above what is being applied by the master cylinder (operator). Although the BPMV is replaceable separately from the EBCM, it is not serviceable and no attempt to disassemble it should be made.

SOLENOID VALVES

Within the BPMV are six solenoid valves. The solenoid valves are used to control the flow of brake fluid to each of the three circuits. There is one pressure hold and one pressure release valve for each

5E1-4 ANTILOCK BRAKE SYSTEM (ABS)

05-01-95
BT0015E1

Figure 1-ABS System

of the front brakes and one pressure hold and one pressure release valve to control the rear brakes. With the solenoid valves in the pressure increase position, fluid pressure is allowed to flow freely from the master cylinder to the front and rear brakes, as in normal braking. In the pressure hold position, the affected wheel is isolated from the master cylinder and fluid pressure is held constant. In the pressure reduce position, the solenoid valves allow the pump and motor to force fluid back into the master cylinder, thus reducing fluid pressure at the brake.

PUMP MOTOR

Within the brake pressure modulator is a pump and motor which is used to reduce brake pressure. This allows the wheel(s) to rotate (preventing lock-up) during antilock mode. The pump and motor are integral parts of the BPMV, and are not serviceable separately.

Electronic Brake Control Module (EBCM)

The Electronic Brake Control Module (EBCM) is attached directly to the Brake Pressure Modulator Valve (BPMV). The EBCM contains the electronic microprocessor which monitors the sensors and controls the system. The EBCM has the ability to do the following:

Monitor System and Detect Errors - The EBCM can monitor each of the three wheel speed sensor circuits individually and detects if the circuit is intact, and the wheel speed information the sensor is sending is accurate. The EBCM also monitors the solenoid valve and pump motor circuits to determine if they are also intact. If a fault exists in the information the EBCM is receiving, the EBCM will store Diagnostic Trouble Code(s) (DTC)'s, and disable the system until repairs have been made. Refer to "Diagnosis" in this section for details.

Control Wheel Locking Tendencies - The EBCM monitors each wheel speed circuit to determine if a wheel(s) are approaching lock-up. If this is detected, the EBCM will control the solenoid valves and pump motor to modulate the fluid pressure so that maximum deceleration and vehicle control is maintained.

Auto Test - At start up, the EBCM will perform an electrical circuit test. As the vehicle reaches approximately 6 k/m (4 mph) (15 km/h (10 mph) with the brake applied) a functional check of the BPMV takes place. During this check, each solenoid valve is cycled and the pump motor is briefly turned on. The driver may notice this as the vehicle begins to move. This only takes place once per ignition cycle and should be considered normal.

Pump Motor Relay and BPMV Relay

The pump motor relay provides power to the pump motor during antilock braking. The BPMV relay provides power to the solenoid valves in the Brake Pressure Modulator Valve (BPMV). Both of these relays are an integral part of the Electronic Brake Control Module (EBCM) and cannot be serviced separately.

Wheel Speed Sensors

The front wheel speed sensor is mounted in the front steering knuckle and is non-adjustable. The connectors for each speed sensor are located near each underhood wheelhouse panel.

The rear wheel speed sensor is mounted in the rear axle differential assembly and is non-adjustable.

The sensors transmit wheel speed information to the EBCM by means of a small AC voltage. This voltage is generated by magnetic induction caused by passing a toothed sensor ring past a stationary sensor. The signal is transmitted to the EBCM through shielded wires.

In this system, the speed of each toothed sensor ring is measured separately. The front wheels are controlled individually, the rear wheels together.

DIAGNOSIS

When an ABS malfunction occurs, indicated by the "ABS" indicator lamp turning on, perform the following preliminary checks:

1. Check to see if the EBCM connector is secure.
2. Check that all other ABS electrical connectors are secure.
3. Check for open fuses.
4. Check entire circuit for shorts or opens before replacing any component.

Important

- Use of the compact spare may result in activating a wheel sensor diagnostic trouble code. This will result in the "ABS" indicator lamp turning on and the deactivation of the antilock brake system. Recycling the ignition switch will reset the system.
- If the "ABS" indicator lamp flickers briefly, refer to "Diagnostic Trouble Code and Symptom Table" in this section.
- Refer to SECTION 8A for electrical wiring diagrams. When a diagnostic chart makes reference to removing/replacing or checking a component for proper mounting, refer to "On-Vehicle Service" in this section.

After all diagnosis and repairs are completed, road-test the vehicle to ensure proper ABS operation and that the "ABS" indicator lamp is off.

Important

- If the Tech 1 was used for diagnosis, disconnect it from the DLC and turn the ignition switch to "OFF" for at least 10 seconds before road testing. This is necessary to reset the EBCM; it is disabled during Tech 1 diagnostics, and does not reset until serial data communication is stopped and ignition power is lost.

DIAGNOSTIC PROCESS

Before beginning diagnosis on the ABS system, obtain a detailed description of when the condition occurred or occurs from the owner. This information

5E1-6 ANTILOCK BRAKE SYSTEM (ABS)

may be useful in duplicating the condition. Perform a quick visual check of all connectors, wiring, wire routing and retention, and system components. Many times, a disconnected or loose connector, open fuse, or misrouted wire can be the cause of a malfunction.

If a visual inspection does not reveal an obvious problem, perform the "ABS Diagnostic System Check" in this section. ALWAYS start with the "ABS Diagnostic System Check." This step is critical in quick and accurate diagnosis of any malfunction, as it will direct you to the specific system area that has a malfunction and will verify that the diagnostic system is functioning properly. Correct system diagnosis cannot be assured if the "ABS Diagnostic System Check" is not performed first.

SELF DIAGNOSTICS

The Electronic Brake Control Module (EBCM) performs system self-diagnostics to assure that the ABS is functioning properly. When the EBCM detects a system malfunction, it will set a Diagnostic Trouble Code (DTC) and alert the driver by turning "ON" the "ABS" indicator lamp, located in the instrument cluster. This DTC will aid the technician in isolating and correcting the system malfunction.

There are seventeen DTCs that may be set by the EBCM. All of the DTCs will disable ABS (allowing power assisted braking only) and turn "ON" the "ABS" indicator lamp for the remainder of the ignition cycle. Refer to "ABS Diagnostic Trouble Code and Symptom Table" in this section for a complete list of ABS DTCs.

The EBCM performs an Auto Test when the vehicle reaches approximately 4 mph (6 km/h) (15 km/h (10 mph) with the brake applied) in either forward or reverse. This test occurs once each ignition cycle. The Auto Test cycles each solenoid valve and the pump motor to check proper component operation. If any malfunction is detected, the EBCM will set a DTC as described above. The Auto Test may be heard and felt while it is taking place and should be considered a normal mode of operation.

DISPLAYING DTCs

The EBCM can display DTCs through the use of the Tech 1 scan tool. Refer to "Tech 1 Diagnostics" in this section for details on Tech 1 operation.

CLEARING DTCs

The DTCs in the EBCM memory are erased by using one of the two following methods:

1. Tech 1 method.
2. Ignition cycle default method.

These two methods are detailed below. Whichever method is used, be sure to verify proper system operation and absence of DTCs when clearing procedure is completed.

The EBCM will not permit DTC clearing until all DTCs have been displayed. Also, DTCs cannot be cleared by unplugging the EBCM, disconnecting the battery cables, or by turning the ignition "OFF" (except on an ignition cycle default).

Tech 1 Method

The Tech 1 can clear ABS DTCs using the Mass Storage Cartridge (MSC) by performing the following steps:

1. Install the Tech 1.
2. Select ABS system features.
3. Select "F2: DTC(s)."
4. Select "Clear DTCs" function. Verify that all DTC(s) have been cleared by selecting the "DTCs" function and observing that no DTCs are present.

The ignition must be turned "OFF" and the Tech 1 disconnected before a road test to check system operation and/or for a DTC resetting. This is necessary because the EBCM will not set DTCs and ABS control functions are disabled when the Tech 1 is installed and monitoring the system. The Tech 1 will log DTCs during some of its diagnostic routines, which are described later.

Ignition Cycle Default Method

If the vehicle power is cycled 100 times without a particular malfunction reappearing, that particular DTC will be erased from EBCM memory, and the ignition cycle counter for that fault within the EBCM will be reset to zero.

INTERMITTENTS AND POOR CONNECTIONS

Most intermittents are caused by faulty electrical connections or wiring, although a sticking relay or solenoid can occasionally be at fault. Refer to "Intermittents and Poor Connections" in SECTION 8A-4 for a very detailed explanation of how to locate and repair intermittent conditions.

Due to the sensitivity of ABS components to Electro-Magnetic Interference (EMI), the following checks should be performed if an intermittent malfunction is suspected:

- Check for proper installation of wiring harnesses resulting from add-on options such as police packages.
- Visually inspect wheel speed sensor and toothed ring for looseness, damage, foreign material accumulation and proper mounting. Replace damaged components, remove any foreign material and properly attach all components.
- Check for proper routing of front wheel speed sensor wiring away from spark plug wires. Refer to service manual SECTION 6D4 for proper spark plug wire routing, SECTION 5E1 for proper wheel speed sensor wire routing.
- Using DVM J 39200, measure resistance of spark plug wires. If J 39200 displays "OL" (infinite) or greater than 30,000 ohms at any time, replace spark plug wires. Refer to SECTION 6D4 of the service manual.
- While test driving vehicle, monitor Tech 1 wheel speeds. If any wheel speed drops or displays an erratic speed, refer to the appropriate wheel speed DTC.

TECH 1 DIAGNOSTICS

Important

- When using the Tech 1 for ABS diagnosis, the antilock brake system is disabled by the EBCM when communicating with the Tech 1. The "ABS" indicator lamp will be illuminated, indicating that only normal power-assisted braking is available.
- After completing all diagnostic procedures with the Tech 1, cycle the ignition "OFF" for at least 10 seconds and disconnect the Tech 1. This will return the ABS to normal system operation.
- Refer to the Tech 1 Mass Storage Cartridge Operator's Manual for additional information about the cartridge.

The Tech 1 has five test modes for diagnosing the antilock brake system. The five test modes are as follows:

- Mode "F0: Data List": In this test mode, the Tech 1 continuously monitors wheel speed data, brake switch status, etc.

Important

- The BPMV relay is turned "OFF" by the EBCM when a DTC is set. When using the Tech 1 to monitor the data list when DTCs are set, the BPMV relay will be noted to be "OFF." This is normal and should not be considered a system malfunction.
- Mode "F1: DTC History": In this test mode, DTC history data is displayed. This data includes how many ignition cycles since the DTC occurred, along with other ABS information. History information on up to three DTCs can be stored.
- Mode "F2: DTC(s)": In this test mode, DTCs stored by the EBCM may be displayed or cleared.
- Mode "F3: Snapshot": In this test mode, the Tech 1 captures ABS data before and after a trigger condition.
- Mode "F4: Misc. Tests": In this test mode, the Tech 1 performs brake pressure modulator functional tests to assist in malfunction isolation during troubleshooting.

Mode F3 Snapshot triggering conditions and Mode F4 functions are detailed below.

Mode F3: Snapshot

Conditions which will cause triggering of the Tech 1 Snapshot feature are listed below. Tech 1 messages displayed when the malfunction is noted are shown in square brackets. Refer to the Tech 1 Operator's Manual for detailed information on use of the Snapshot feature.

- Loss of serial data.
- BPMV relay < 11 volts [low voltage].
- BPMV relay OFF (< 2 volts)(relay will be "OFF" if DTCs are set).

- One wheel speed ± 8 mph of others [intermittent wheel speed].
- Two wheel speeds ± 3 mph of each other and one ± 5 mph of the others [wheel speed out of range].
- Brake fluid pressure differential.
- System voltage > 17 volts [high voltage].
- Brake switch state change of "ON-OFF-ON" in <200 ms [intermittent brake switch].

Mode F4: Misc. Tests

The "Misc. Tests" mode performs functional tests on the antilock brake system which help verify proper operation. In this mode, malfunctions can be further identified by testing and observing the test results. DTCs must be cleared before any tests in Mode F4 (Misc. tests) can be performed. In the "Misc. Tests" mode, the following tests can be performed:

- Solenoid Valve - Pressure Release - This test indicates whether specific solenoid valves in the BPMV release pressure in assigned hydraulic wheel circuits.
- Solenoid Valve - Pressure Hold - This test indicates whether specific solenoid valves in the BPMV hold pressure in assigned hydraulic wheel circuits.
- Auto Test - This test cycles each solenoid valve and operates the pump motor briefly. The EBCM will store a DTC if the test conditions fail.

PRESSURE RELEASE TEST

The "PRESSURE RELEASE" test activates selected hydraulic wheel circuit valves, placing them in the pressure reduce position. Valve action can then be verified by checking the appropriate wheel for proper brake action. The Tech 1 will indicate whether the valve action was commanded properly. This test is used in conjunction with the "PRESSURE HOLD" test to completely check each solenoid valve. With an assistant, the "PRESSURE RELEASE" test can be verified as follows:

1. Ignition "OFF."
2. Install the Tech 1 with Mass Storage Cartridge.
3. Ignition to "RUN".
4. Raise the vehicle such that the wheels are about 6" off the floor.
5. Have an assistant press and hold the brake pedal.
6. Select "F4: Misc. Tests."
7. Select "F0: Solenoid Tests."
8. Select the solenoid to be tested.
9. Command the "PRESSURE RELEASE" on the Tech 1.
10. Try to spin the wheel being tested by hand; it should spin due to the "PRESSURE RELEASE" command, even though the assistant is applying pressure to the brake pedal.

PRESSURE HOLD TEST

The "PRESSURE HOLD" test activates selected hydraulic wheel circuit valves, placing them in the pressure hold position. Valve action can then be

5E1-8 ANTILOCK BRAKE SYSTEM (ABS)

verified by checking the appropriate wheel for proper brake action. The Tech 1 will indicate whether the valve action was commanded properly. This test is used in conjunction with the "PRESSURE RELEASE" test to completely check each solenoid valve. With an assistant, the "PRESSURE HOLD" test can be verified as follows:

1. Ignition "OFF."
2. Install the Tech 1 with Mass Storage Cartridge.
3. Ignition to "RUN".
4. Raise the vehicle such that the wheels are about 6" off the floor.
5. Select "F4: Misc. Tests."
6. Select "F0: Solenoid Tests."
7. Select the solenoid to be tested.
8. Command the "PRESSURE HOLD" with the Tech 1.
9. Have an assistant press and hold the brake pedal.
10. Try to spin the wheel being tested by hand; it should spin due to the "PRESSURE HOLD" command, even though the assistant is applying pressure to the brake pedal.

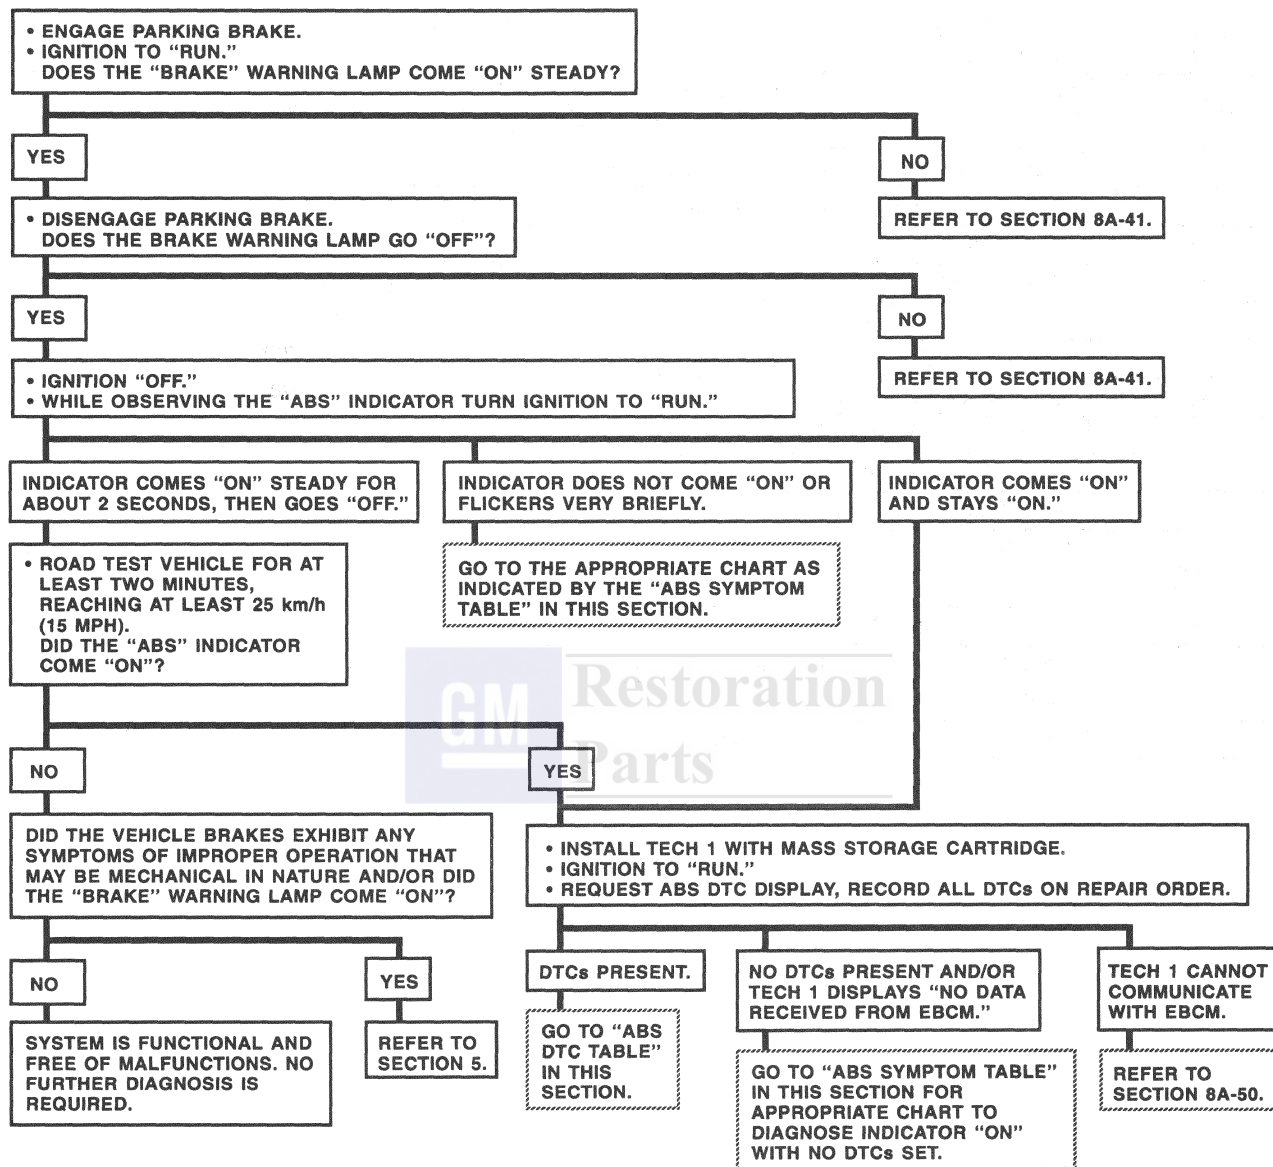

AUTO TEST

The "AUTO TEST" cycles each solenoid valve and the pump motor to check component operation. This test is identical to the "AUTO TEST" the system performs on itself once per ignition cycle when the vehicle speed reaches approximately 4 mph (6 km/h) (15 km/h (10 mph) with the brake applied) in either forward or reverse. If any malfunction is detected during this test, the EBCM will set a DTC and turn "ON" the "ABS" indicator lamp. Perform the test as follows:

1. Ignition "OFF."
2. Install the Tech 1 with Mass Storage Cartridge.
3. Ignition to "RUN".
4. Select "F4: Misc. Tests."
5. Select "F1: AUTO TEST."
6. Run the "AUTO TEST" by pressing "ENTER."
7. Note any DTCs that are set.

ABS DIAGNOSTIC SYSTEM CHECK

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

CHART A

(Page 1 of 2)

ABS INDICATOR "ON" WITH NO DTCs SET

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Confirms that a malfunction condition exists.
2. Determines whether the malfunction is due to a DTC setting condition, an indicator low side circuit malfunction, or an EBCM supply power malfunction.
3. Checks whether the malfunction is due to an open fuse.
4. Checks for an open power feed circuit.
5. Checks for an open in the ground feed to the EBCM.
6. Checks for proper connection of EBCM ground CKT 51.
7. Checks whether the fuse malfunction is due to a short to ground.
8. Identifies if the short to ground found in Step 7 is in CKT 539 or the EBCM.

CHART A (Page 1 of 2) **ABS INDICATOR "ON"** **WITH NO DTCs SET**

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C6819

5E1-24 ANTILOCK BRAKE SYSTEM (ABS)

DTC(s) 21,25 (Page 1 of 2)

FRONT WHEEL SPEED SENSOR CIRCUIT MALFUNCTION

Circuit Description:

The toothed wheel generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC Will Set When:

- There is a short to voltage or ground in (CKT 872 or 833 RF)(CKT 873 or 830 LF).
- There is a malfunctioning speed sensor.
- It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause this fault.

The test for this malfunction occurs when the vehicle is in motion; it will not set with the ignition in the "RUN" position and the vehicle at rest.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks for proper resistance in the sensor itself.

2. Checks for a short to voltage in either of the speed sensor circuit wires.
3. Checks for a short between the speed sensor circuit wires.
4. Checks for a short to ground in the speed sensor input circuit wire. The ground may be either a "hard" short to ground, or a resistive (partial) short. A short with a resistance less than 2 megohms, though not a hard short, can still cause the DTC to set.

Diagnostic Aids:

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

The Tech 1 can also be used to monitor the wheel speeds during a road test. Watch the wheel speeds being displayed on the Tech 1 to see if any of the readings are unusual, such as one sensor varying in speed from the other three, a signal going intermittently high or low, etc. If this does not identify the intermittent, wet the speed sensor harness on the underside of the vehicle and road test monitoring wheel speeds with the Tech 1.

DTC(s) 21, 25
(Page 1 of 2)
FRONT WHEEL
SPEED SENSOR
CIRCUIT
MALFUNCTION

ENSURE SENSOR IS NOT VISIBLY DAMAGED; IF IT IS DAMAGED, REPLACE THE SENSOR, CLEAR DTCs, AND ROAD TEST TO SEE IF DTC RESETS.

1

- IGNITION "OFF".
- DISCONNECT SENSOR CONNECTOR.
- USING J 39200 AND ADAPTER FROM J 35616-A, CHECK SENSOR RESISTANCE BY PROBING SENSOR CONNECTOR TERMINALS. IS RESISTANCE 1015-1245 Ω ?

YES

NO

REPLACE SENSOR.

2

- DISCONNECT EBCM CONNECTOR.
- CONNECT J 39200 BETWEEN SENSOR HARNESS CONNECTOR TERMINAL "A" AND GROUND (USE DC VOLTAGE SETTING).
- IGNITION TO "RUN".
- NOTE VOLTAGE; REPEAT BETWEEN TERMINAL "B" AND GROUND. IS VOLTAGE GREATER THAN 1 V ON EITHER TERMINAL "A" OR "B"?

NO

YES

REPAIR SHORT TO VOLTAGE IN CKT:
 RF - 872 OR 833; LF 873 OR 830.

3

- IGNITION "OFF".
- INSTALL J 39700 UNIVERSAL BREAKOUT BOX WITH ADAPTER J 39700-15 TO EBCM HARNESS CONNECTOR ONLY.
- USING J 39200, MEASURE RESISTANCE BETWEEN J 39700 TERMINALS: RF - "23" AND "24", LF - "16" AND "17". DOES J 39200 DISPLAY RESISTANCE AS "OL" (INFINITE)?

YES

NO

REPAIR SHORT BETWEEN CKTS: 872 AND 833 FOR RF; 873 AND 830 FOR LF.

4

- USING J 39200, MEASURE RESISTANCE BETWEEN J 39700 TERMINAL "23" FOR RF OR "16" FOR LF, AND GROUND. DOES J 39200 DISPLAY RESISTANCE AS "OL" (INFINITE)?

YES

NO

REPAIR SHORT TO GROUND IN CKT 872 FOR RF OR 830 FOR LF.

CONTINUE DIAGNOSTICS ON NEXT PAGE.

DTC(s) 21,25 (Page 2 of 2)

FRONT WHEEL SPEED SENSOR CIRCUIT MALFUNCTION

Circuit Description:

The toothed wheel generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC Will Set When:

- There is a short to voltage or ground in (CKT 872 or 833 RF)(CKT 873 or 830 LF).
- There is a malfunctioning speed sensor.
- It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause this fault.

The test for this malfunction occurs when the vehicle is in motion; it will not set with the ignition in the "RUN" position and the vehicle at rest.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

5. Checks if the DTC resets during a road test. If so, since tests 1-4 have validated that the circuitry and

components are good, intermittent malfunctions are suspected.

6. Checks wiring and connectors for intermittents.
7. Replace the wheel speed sensor as it is likely the cause of a DTC reset experienced during the road test, since other portions of the circuit have checked out OK. If the DTC resets after sensor replacement, the EBCM must be concluding there is a malfunction present in the speed sensor circuit when there is not.
8. Ensures DTC was not set due to electromagnetic interference.

Diagnostic Aids:

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

The Tech 1 can also be used to monitor the wheel speeds during a road test. Watch the wheel speeds being displayed on the Tech 1 to see if any of the readings are unusual, such as one sensor varying in speed from the other three, a signal going intermittently high or low, etc. If this does not identify the intermittent, wet the speed sensor harness on the underside of the vehicle and road test monitoring wheel speeds with the Tech 1.

5E1-28 ANTILOCK BRAKE SYSTEM (ABS)

DTC 35

(Page 1 of 2)

REAR WHEEL SPEED SENSOR CIRCUIT MALFUNCTION

Circuit Description:

The toothed wheel (mounted to the differential pinion gear) generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC 35 Will Set When:

- There is a short to voltage or ground in CKT 883 or 882.
- There is a malfunctioning speed sensor.
- It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause this fault

The test for this malfunction occurs when the vehicle is in motion; it will not set with the ignition in "RUN" and the vehicle at rest.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks for proper resistance in the sensor itself.

2. Checks for a short to voltage in either of the speed sensor circuit wires.
3. Checks for a short between the speed sensor circuit wires.
4. Checks for a short to ground in the speed sensor input circuit wire. The ground may be either a "hard" short to ground, or a resistive (partial) short. A short with a resistance less than 2 megohms, though not a hard short, can still cause DTC 35 to set.

Diagnostic Aids:

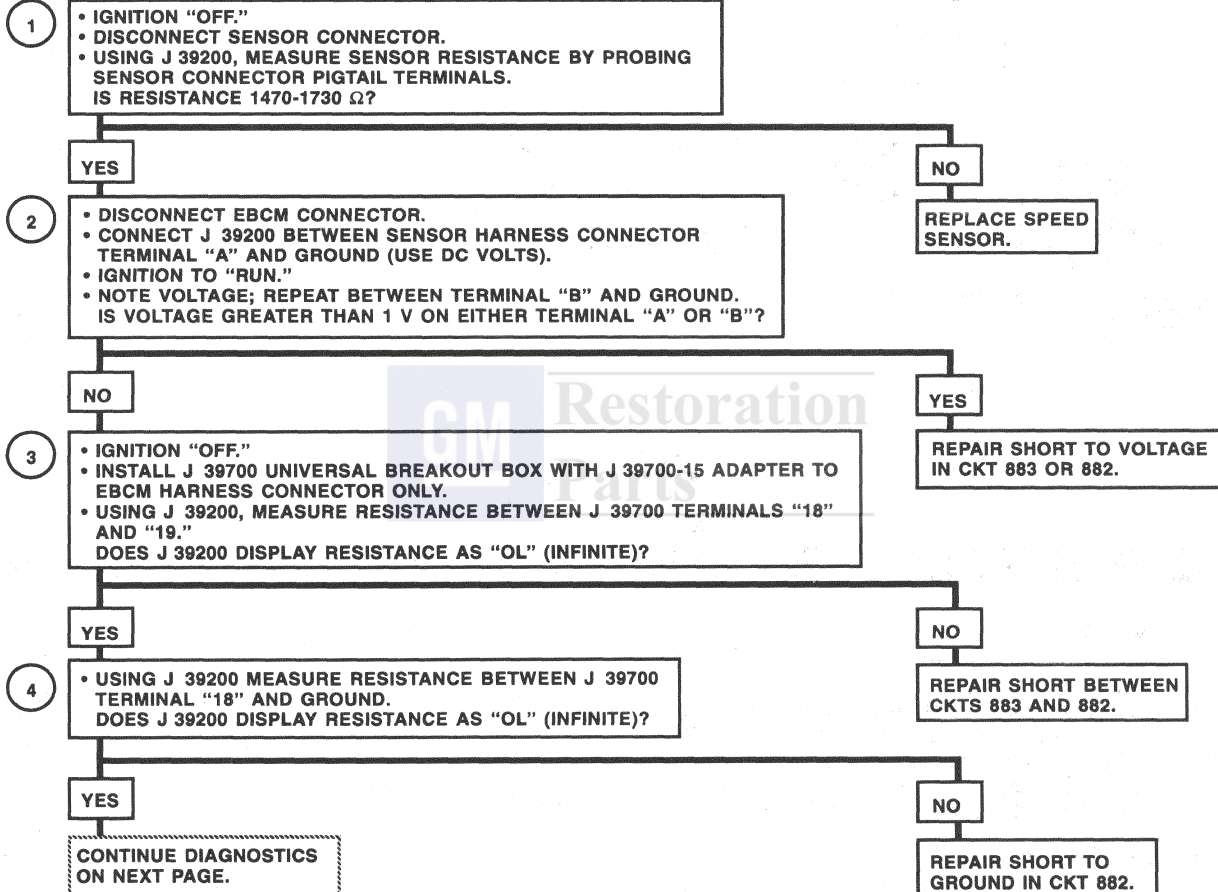

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

The Tech 1 can also be used to monitor the wheel speeds during a road test. Watch the wheel speeds being displayed on the Tech 1 to see if any of the readings are unusual, such as one sensor varying in speed from the other three, a signal going intermittently high or low, etc. If this does not identify the intermittent, wet the speed sensor harness on the underside of the vehicle and road test monitoring wheel speeds with the Tech 1.

**REAR WHEEL
SPEED SENSOR
CIRCUIT
MALFUNCTION**

ENSURE SENSOR IS NOT VISIBLY DAMAGED, AND THAT IT IS PROPERLY MOUNTED. IF IT IS NOT PROPERLY MOUNTED OR RETAINED, PROPERLY ATTACH IT; IF IT IS DAMAGED, REPLACE IT. THEN, CLEAR DTCs AND ROAD TEST TO SEE IF DTC RESETS.

5E1-30 ANTILOCK BRAKE SYSTEM (ABS)

DTC 35

(Page 2 of 2)

REAR WHEEL SPEED SENSOR CIRCUIT MALFUNCTION

Circuit Description:

The toothed wheel (mounted to the differential pinion gear) generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC 35 Will Set When:

- There is a short to voltage or ground in CKT 883 or 882.
- There is a malfunctioning speed sensor.
- It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause this fault

The test for this malfunction occurs when the vehicle is in motion; it will not set with the ignition in "RUN" and the vehicle at rest.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

5. Checks if the DTC resets during a road test. If so, since tests 1-4 have validated that all of the circuitry and components are good, intermittent malfunctions are suspected.

6. Checks wiring and connectors for intermittents.

7. Checks for sensor mounting and for damage to the toothed wheel which may be causing the malfunction.

8. Replace the speed sensor as it is likely the cause of a DTC reset experienced during the road test, since other portions of the circuit have checked out OK.

Diagnostic Aids:

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

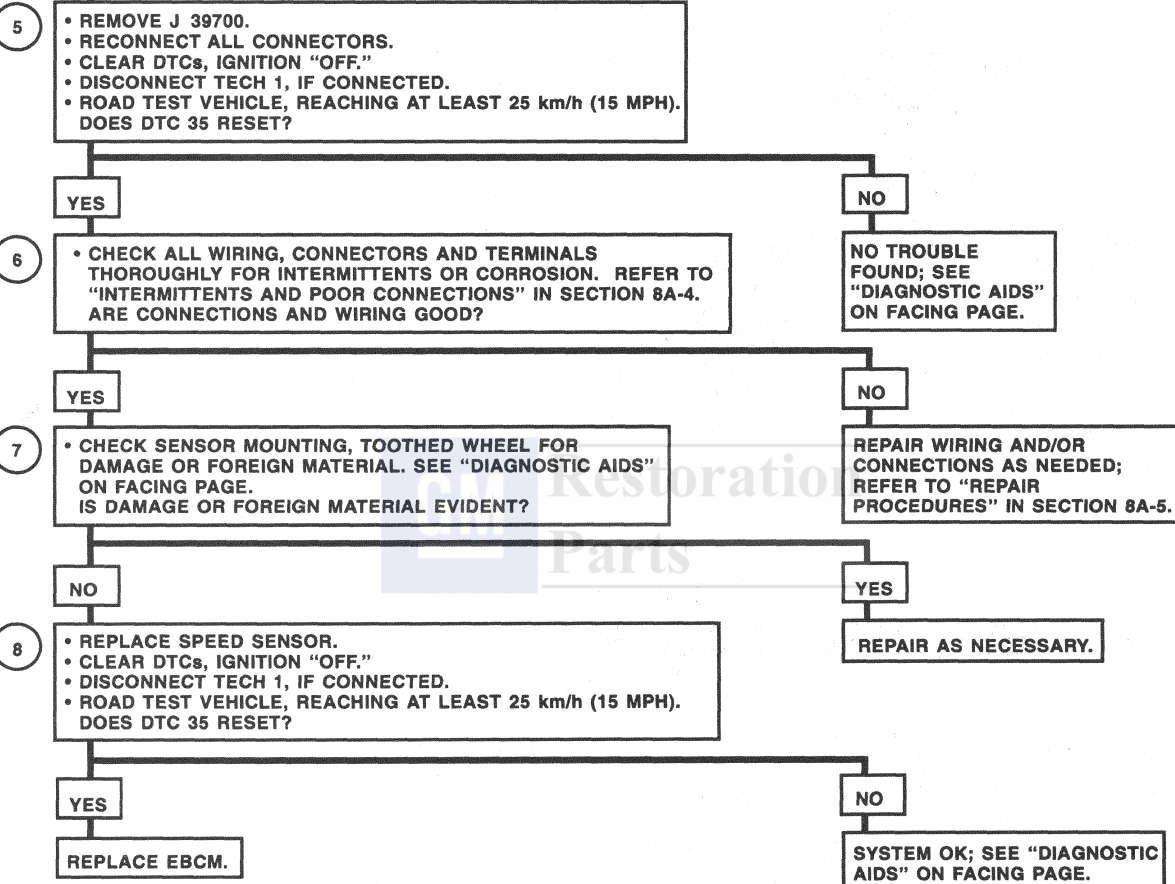

Check the toothed wheel for any large grooves, gouges, marks, or buildup of foreign material between the teeth, also check for metal shavings attached to sensor face that might influence the signal at the wheel speed sensor.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

The Tech 1 can also be used to monitor the wheel speeds during a road test. Watch the wheel speeds being displayed on the Tech 1 to see if any of the readings are unusual, such as one sensor varying in speed from the other three, a signal going intermittently high or low, etc. If this does not identify the intermittent, wet the speed sensor harness on the underside of the vehicle and road test monitoring wheel speeds with the Tech 1.

C8438

5E1-32 ANTILOCK BRAKE SYSTEM (ABS)

DTC(s) 23,27,37
(Page 1 of 2)

WHEEL SPEED SENSOR CIRCUIT CONTINUITY MALFUNCTION

Circuit Description:

The toothed wheel generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC Will Set When:

- There is a short to voltage or an open in the affected circuit.
- There is a malfunctioning speed sensor.

The test for this malfunction occurs any time with the ignition in the "RUN" position.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Check for proper resistance in the sensor itself.

2. Checks for a short to voltage in either of the speed sensor circuit wires.
3. Checks for an open in both the speed sensor circuit wires.
4. Manipulates wiring and connectors, trying to induce an intermittent malfunction not currently present.
5. This test checks if the DTC resets.

Diagnostic Aids:

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

5E1-34 ANTILOCK BRAKE SYSTEM (ABS)

DTC(s) 23,27,37

(Page 2 of 2)

WHEEL SPEED SENSOR CIRCUIT CONTINUITY MALFUNCTION

Circuit Description:

The toothed wheel generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC Will Set When:

- There is a short to voltage or an open in the affected circuit.
- There is a malfunctioning speed sensor.

The test for this malfunction occurs any time with the ignition in the "RUN" position.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

6. Checks if DTC (21 RF),(25 LF) or (35 R) sets during a road test.

7. If the circuit malfunction DTC sets at this point, diagnostics for circuit malfunctions should be used.
8. The wheel speed sensor may be causing an intermittent malfunction. If DTC resets after sensor replacement, the EBCM must be concluding there is a malfunction present in the speed sensor circuit when there is not.

Diagnostic Aids:

Be sure the speed sensor wiring is properly routed and retained. This will help prevent false signals due to electrical noise being picked up by the wiring.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC(s) 23, 27, 37
(PAGE 2 OF 2)
WHEEL SPEED SENSOR
CIRCUIT CONTINUITY
MALFUNCTION

DTC 28 WHEEL SPEED SENSOR CIRCUIT FREQUENCY MALFUNCTION

Circuit Description:

The toothed wheel generates a voltage pulse as it moves past the sensor; each tooth-gap-tooth series on the wheel generates a pulse. The frequency of these pulses is used by the EBCM to determine wheel speed. The amplitude of the voltage generated in each pulse depends on the air gap between the sensor and the toothed wheel, and on wheel speed.

DTC 28 Will Set When:

- The EBCM cannot specifically identify which wheel speed sensor is causing the frequency error malfunction. If the EBCM can define the specific speed sensor causing the malfunction, the DTC associated with the sensor (21,25,35) will be set instead of DTC 28.
- It is possible that driving with a compact spare at speeds above 40 km/h (24 mph) may cause this fault.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks wiring and connections for malfunctions. It is critical that this step is performed thoroughly, as wiring/connector malfunctions are the most likely case for this DTC.
2. Uses the Tech 1 to monitor for vehicle electrical/electronic system "noise" being picked up by the speed sensor circuits.

3. Uses the Tech 1 to monitor the wheel speed sensors while the vehicle is operating. If the Tech 1 auto-trigger snapshot mode triggers, the speed sensor or the wiring and/or connectors are going intermittent during the road test.
4. Checks for proper resistance in the sensor itself.
5. Replace wheel speed sensor as the likely cause of the triggering intermittent.
6. Ensures DTC does not reset due to a malfunctioning EBCM.
7. Checks for a short to ground in both the speed sensor "HI" and "LO" circuit wires. The circuit to be tested depends on which speed sensor triggered the Tech 1. The ground may be either a "hard" short to ground, or a resistive (partial) short. A short with a resistance less than 2 megohms, though not a hard short, can still cause DTC 28 to set.
8. Ensures DTC was not set due to electromagnetic interference.

Diagnostic Aids:

Check the toothed wheel for any large grooves, gouges, marks, etc. That might influence the tooth's signal at the wheel speed sensor. Also check for a buildup of foreign material in the gaps between teeth in the toothed wheel; this material may cause this malfunction.

A worn front hub/bearing assembly may cause this malfunction in extreme cases; the bearing play allows the sensor-toothed-ring gap to change excessively.

DTC 28 WHEEL SPEED SENSOR CIRCUIT FREQUENCY MALFUNCTION

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C6823

5E1-38 ANTILOCK BRAKE SYSTEM (ABS)

DTC(s) 41,45,55

RF, LF, AND REAR INLET VALVE SOLENOID MALFUNCTION

Circuit Description:

The wheel valve solenoid circuits are supplied with battery power when the ignition is in the "RUN" position. The EBCM controls the valve functions by grounding the circuit when necessary.

DTC Will Set When:

- The EBCM senses a discrepancy such as an open, short to ground or voltage internal to the EBCM and BPMV.
- There is poor connection in the circuit internal to the EBCM and BPMV.
- There is a malfunctioning solenoid valve.

Action Taken:

The valve relay will turn "OFF," the "ABS" lamp will come "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks if DTC 71 was set concurrently with valve DTC.

2. Checks condition of EBCM to BPMV connector, and for presence of brake fluid.
3. Checks the integrity of the affected valve solenoid circuitry internal to the BPMV, and the valve solenoid coil.
4. Checks for solenoid circuit short to ground (BPMV case).
5. Uses the Tech 1 to exercise the affected valve solenoid and check it for proper operation.
6. Checks for continued DTC setting after validating that the circuitry and the solenoid valve is good. If DTC resets, the EBCM is likely malfunctioning.

Diagnostic Aids:

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC(s) 41, 45, 55 **RF, LF, AND REAR INLET VALVE** **SOLENOID MALFUNCTION**

NOTICE: J 39200 TEST LEADS MUST BE "ZEROED" PRIOR TO MAKING ANY RESISTANCE MEASUREMENTS. REFER TO J 39200 USER'S MANUAL.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C10124

5E1-40 ANTILOCK BRAKE SYSTEM (ABS)

DTC(s) 42,46,56

RF, LF, AND REAR OUTLET VALVE SOLENOID MALFUNCTION

Circuit Description:

The wheel valve solenoid circuits are supplied with battery power when the ignition is in the "RUN" position. The EBCM controls the valve functions by grounding the circuit when necessary.

DTC Will Set When:

- The EBCM senses a discrepancy such as an open, short to ground or voltage.
- There is poor connection in the circuit internal to the EBCM and BPMV.
- There is a malfunctioning solenoid valve.

Action Taken:

The valve relay will turn "OFF," the "ABS" lamp will come "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks if DTC 71 was set concurrently with valve DTC.
2. Checks condition of EBCM to BPMV connector,

and for presence of brake fluid.

3. Checks the integrity of the affected valve solenoid circuitry internal to the BPMV, and the valve solenoid coil.
4. Checks for solenoid circuit short to ground (BPMV case).
5. Uses the Tech 1 to exercise the affected valve solenoid and check it for proper operation.
6. Checks for continued DTC setting after validating that the circuitry and the solenoid valve is good. If DTC resets, the EBCM is likely malfunctioning.

Diagnostic Aids:

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC(s) 42, 46, 56 RF, LF, AND REAR OUTLET VALVE SOLENOID MALFUNCTION

NOTICE: J 39200 TEST LEADS MUST BE "ZEROED" PRIOR TO MAKING ANY RESISTANCE MEASUREMENTS. REFER TO J 39200 USER'S MANUAL.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C10125

DTC 61

(page 1 of 2)

BPMV PUMP MOTOR MALFUNCTION

Circuit Description:

When the pump motor relay is grounded by the EBCM, it closes and provides voltage to operate the pump. Once the motor circuit is energized, a "Pump ON" signal is sensed by the EBCM to verify pump operation.

DTC Will Set When:

- Voltage is present at the pump motor without pump motor relay activation from the EBCM.
- Voltage is NOT present at the pump motor within 40 milliseconds after the EBCM requests pump motor relay activation.
- The motor GND circuit is open.
- There is a pump motor malfunction.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks that Fusible Link "B" feeding the EBCM Motor Relay circuit is good.
2. Checks for an open in Pump Motor Ground CKT 1250.
3. Measures for appropriate voltage from the EBCM motor relay circuit, using the EBCM ground line to complete the circuit.
4. Checks EBCM connector terminals for good contact, i.e., not spread open, backed out of connector, corroded, etc.

Diagnostic Aids:

All tests using J 39700 Universal Breakout Box terminal "1" are using the terminal as ground. These tests assume that the ground CKT at terminal "1" is good.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC 61

BPMV PUMP
MOTOR MALFUNCTION

BEFORE BEGINNING TESTING, ENSURE THAT BATTERY IS FULLY CHARGED, AND THAT CHARGING SYSTEM IS OPERATING PROPERLY IF DISCHARGED BATTERY IS NOTED. REFER TO SECTION 6D1 FOR BATTERY INFORMATION AND/OR SECTION 6D3 FOR CHARGING SYSTEM INFORMATION.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C6826

DTC 61

(Page 2 of 2)

BPMV PUMP MOTOR MALFUNCTION

Circuit Description:

When the pump motor relay is grounded by the EBCM, it closes and provides voltage to operate the pump. Once the motor circuit is energized, a "Pump ON" signal is sensed by the EBCM to verify pump operation.

DTC Will Set When:

- Voltage is present at the pump motor without pump motor relay activation from the EBCM.
- Voltage is NOT present at the pump motor within 40 milliseconds after the EBCM requests pump motor relay activation.
- The motor GND circuit is open.
- There is a pump motor malfunction.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

5. Checks EBCM connector for good retention to EBCM when installed.
6. Checks for condition of EBCM to BPMV connector, and for presence of brake fluid.
7. Checks the integrity of the pump motor and pump motor circuitry internal to the BPMV.
8. Uses the Tech 1 to check for proper operation of the pump motor and associated circuitry.

Diagnostic Aids:

All tests using J 39700 Universal Breakout Box terminal "1" are using the terminal as ground. These tests assume that the ground CKT at terminal "1" is good.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC 61

BPMV PUMP
MOTOR MALFUNCTION

DIAGNOSIS CONTINUED
FROM PREVIOUS PAGE.

5

- REMOVE J 39700.
 - RECONNECT EBCM.
- IS CONNECTOR PROPERLY RETAINED TO EBCM WHEN CONNECTED?

YES

NO

6

- IGNITION "OFF."
 - DISCONNECT EBCM CONNECTOR.
 - REMOVE EBCM FROM BPMV.
 - INSPECT EBCM TO BPMV CONNECTOR FOR CONDITIONS WHICH COULD CAUSE INTERMITTENTS SUCH AS DAMAGE, CORROSION, POOR TERMINAL CONTACT, OR PRESENCE OF BRAKE FLUID. REFER TO "INTERMITTENTS AND POOR CONNECTION" IN SECTION 8A-4.
- IS CONNECTOR OK AND CAVITY FREE OR BRAKE FLUID?

REPLACE OR REPAIR
WIRING HARNESS
CONNECTOR OR EBCM
AS NEEDED TO OBTAIN
PROPER CONNECTOR
RETENTION.

YES

NO

7

- INSTALL J 41247 BPMV PINOUT BOX TO BPMV CONNECTOR.
 - USING J 39200, MEASURE RESISTANCE BETWEEN J 41247 TERMINAL "8" AND PUMP MOTOR GROUND STUD.
- IS RESISTANCE .05-10 Ω ?

• CONNECTOR CORROSION OR
DAMAGE: REPLACE BPMV
AND/OR EBCM.
• BRAKE FLUID PRESENT:
REPLACE BPMV AND EBCM.

YES

NO

8

- REMOVE J 41247.
 - RE-INSTALL EBCM TO BPMV.
 - RE-CONNECT EBCM CONNECTOR.
 - IGNITION TO "RUN".
 - PERFORM TECH 1 AUTO TEST.
- DOES PUMP MOTOR RUN?

REPLACE BPMV.

YES

NO

NO TROUBLE FOUND SEE "DIAGNOSTIC
AIDS" ON FACING PAGE.

REPLACE EBCM.

NOTICE: J39200 TEST LEADS MUST BE "ZEROED" PRIOR TO MAKING ANY
RESISTANCE MEASUREMENTS. REFER TO J 39200 USER'S MANUAL.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C6827

DTC 63

(Page 1 of 2)

BPMV POWER SUPPLY MALFUNCTION

Circuit Description:

The solenoid valves are supplied voltage from fusible link "B" through the valve relay to operate. The EBCM monitors the valve feed circuit to determine if a valve response to an EBCM activation request is detected.

DTC Will Set When:

- 2 or more valves do not respond to an EBCM request.
- The EBCM senses a discrepancy such as an open or a short to ground in the circuit.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks that Fusible Link "B" feeding the Valve Relay circuit is good.

2. Measures for appropriate voltage from the valve circuit supply voltage.
3. Checks EBCM connector terminals for good contact, i.e., not spread open, backed out of connector, corroded, etc.

Diagnostic Aids:

All tests using J 39700 Universal Breakout Box terminal "1" are using that terminal as ground. These tests assume that the ground at terminal "1" is good.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC 63 (Page 1 of 2) BPMV POWER SUPPLY MALFUNCTION

BEFORE BEGINNING TESTING, ENSURE THAT BATTERY IS FULLY CHARGED, AND THAT CHARGING SYSTEM IS OPERATING PROPERLY IF DISCHARGED BATTERY IS NOTED. REFER TO SECTION 6D1 FOR BATTERY INFORMATION AND/OR SECTION 6D3 FOR CHARGING SYSTEM INFORMATION.

1

- ENSURE FUSIBLE LINK "B" IS GOOD. IS FUSIBLE LINK "B" OPEN?

NO

YES

REPAIR SHORT TO GROUND IN CKT 102.

2

- IGNITION "OFF."
- DISCONNECT EBCM CONNECTOR.
- INSTALL J 39700 UNIVERSAL BREAKOUT BOX WITH J 39700-15 ADAPTER TO EBCM HARNESS CONNECTOR ONLY.
- CONNECT J 39200 BETWEEN J 39700 TERMINALS "3" AND "1". NOTE VOLTAGE.
- WAS VOLTAGE MEASUREMENT WITHIN 1V OF BATTERY VOLTAGE?

YES

NO

3

- DISCONNECT EBCM HARNESS CONNECTOR FROM J 39700.
- CHECK EBCM HARNESS CONNECTOR CAREFULLY TO ENSURE GOOD ELECTRICAL CONTACT AT ALL TERMINALS, ESPECIALLY TERMINALS "3" AND "1". ARE TERMINALS CORRODED OR DAMAGED?

REPAIR OPEN OR POOR CONNECTION IN CKT 102.

NO

YES

CONTINUE DIAGNOSTICS ON NEXT PAGE.

REPAIR/REPLACE TERMINALS AND/OR CONNECTOR AS NECESSARY. REFER TO EBCM ELECTRICAL CONNECTOR REPAIR IN THIS SECTION.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C6828

DTC 63

(Page 2 of 2)

BPMV POWER SUPPLY MALFUNCTION

Circuit Description:

The solenoid valves are supplied voltage from fusible link "B" through the valve relay to operate. The EBCM monitors the valve feed circuit to determine if a valve response to an EBCM activation request is detected.

DTC Will Set When:

- 2 or more valves do not respond to an EBCM request.
- The EBCM senses a discrepancy such as an open or a short to ground in the circuit.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

4. Checks condition of EBCM to BPMV connector, and for presence of brake fluid.

5. Checks EBCM connector for good retention to EBCM when installed.
6. Ensures DTC does not reset due to a malfunctioning EBCM.

Diagnostic Aids:

All tests using J 39700 Universal Breakout Box terminal "1" are using that terminal as ground. These tests assume that the ground at terminal "1" is good.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC 63
(Page 2 of 2)
**BPMV POWER SUPPLY
MALFUNCTION**

DIAGNOSTICS CONTINUED
FROM PREVIOUS PAGE

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C8436

DTC 71 EBCM INTERNAL MALFUNCTION

Circuit Description:

The EBCM performs various self diagnostics that can detect an internal malfunction within the module. If it detects a malfunction, DTC 71 will set.

DTC Will Set When:

- The EBCM finds an internal malfunction during self diagnostics.

Action Taken:

The "ABS" lamp will be "ON." ABS is disabled.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks for good connections from the harness to the EBCM itself.

2. Checks to see if the malfunction was false. If DTC 71 resets, replace the EBCM.

Diagnostic Aids:

All tests using J 39700 Universal Breakout Box terminal "1" are using that terminal as ground. these tests assume that the ground at terminal "1" is good.

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis causing part replacement with reappearance of the malfunction.

DTC 71 EBCM INTERNAL MALFUNCTION

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C10113

5E1-52 ANTILOCK BRAKE SYSTEM (ABS)

DTC 85 LOW VOLTAGE

Circuit Description:

The EBCM requires a certain minimum voltage to operate properly. It monitors the ignition feed circuit to determine if voltage falls below a minimum level.

DTC Will Set When:

- The EBCM operating voltage falls below 9.4 volts out of ABS control, 8.8 volts during ABS control and the low voltage is detected for more than 500 milliseconds with the vehicle speed above 6 km/h (3.6 mph).

Action Taken:

The ABS valves are switched passive, which prevents a possible pump start-up and the "ABS" lamp will be "ON."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

- Checks that PCM/IGN fuse feeding the EBCM ignition circuit is good.

- Measures for appropriate voltage from the EBCM ignition circuit.
- Checks EBCM connector terminals for good contact, i.e., not spread open, backed out of connector, corroded, etc.
- Checks EBCM connector for good retention to EBCM when installed.
- Checks for DTC reset after other portions of the system have tested OK.
- Determines if a malfunction found in step 2 is due to an open or poor connection in the EBCM ignition feed CKT 539, or poor ground in CKT 51.
- Checks whether the fuse failure is due to a short to ground.

Diagnostic Aids:

It is very important that a thorough inspection of the wiring and connectors be performed. Failure to carefully and fully inspect wiring and connectors may result in misdiagnosis, causing part replacement with reappearance of the malfunction.

DTC 85 LOW VOLTAGE

BEFORE BEGINNING TESTING, ENSURE THAT BATTERY IS FULLY CHARGED, AND THAT CHARGING SYSTEM IS OPERATING PROPERLY IF DISCHARGED BATTERY IS NOTED. REFER TO SECTION 6D1 FOR BATTERY INFORMATION AND/OR SECTION 6D3 FOR CHARGING SYSTEM INFORMATION.

WHEN ALL DIAGNOSIS AND REPAIRS ARE COMPLETED, CLEAR DTCs AND VERIFY PROPER OPERATION.

C8435

ON-VEHICLE SERVICE**GENERAL SERVICE PRECAUTIONS**

NOTICE: The following are general precautions which should be observed when servicing the antilock brake system and/or other vehicle systems. Failure to observe these precautions may result in antilock brake system damage. See "CAUTIONS" and "NOTICES" on page 5E1-1.

- Before performing electric welding procedures, unplug the EBCM harness connector.
- Always carefully note the routing, position, mounting and location of ABS wiring, connectors, clips, brackets, etc. ABS components are extremely sensitive to Electro-Magnetic Interference (EMI). Proper mounting is critical when servicing ABS components.
- Do not use a quick charger for engine starting or for battery charging if the battery is still connected to the vehicle's electrical system. Failure to observe this precaution may cause the brake fuse to open or cause serious damage to other electrical components. Always disconnect the battery negative cable when charging a battery.
- Never disconnect the battery from the electrical system with the engine running.
- When disconnecting the EBCM connector, the ignition switch must be in the "OFF" position.
- Do not hang the suspension components by the wheel speed sensor cables, cable damage may result.
- Do not force the wheel speed sensors into place. The sensors are to be pushed in by hand only.
- During painting work, the EBCM may be subjected to a maximum of 95°C (203°F) for brief periods and a maximum of 85°C (184°F) for lengthy periods (about two hours).
- Many components of the Antilock Brake System are non-serviceable and must be replaced as assemblies. Do not disassemble any component which is designated as non-serviceable in this section.
- When filling the master cylinder, use only Supreme 11 (GM 1052542) or equivalent DOT 3 brake fluid. Do not use a container which has been used for petroleum based fluids, or a container which is wet with water. Petroleum based fluids will cause swelling and distortion of rubber parts in the hydraulic brake system, and water will mix with brake fluid, lowering the fluid boiling point. Keep all fluid containers capped to prevent contamination.
- After replacement of the Brake Pressure Modulator Valve (BPMV), EBCM wheel speed sensors, wiring harness, or other work involving the ABS system, the entire ABS system must be checked using the Tech 1 Diagnostic Tester. Refer to "Diagnosis" in this section.

The above precautions are not exhaustive and are to be followed when working on an ABS equipped vehicle. Become familiar with the ABS and how it may be interrelated to other components on the vehicle when performing service work.

NOTICE: Do not use lubricated compressed air on brake parts as damage to rubber components may result.

? Important

- Replace all components included in repair kits used to service this system.
- Lubricate rubber parts with clean brake fluid to make assembly easier.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system. The torque values specified are for dry, unlubricated fasteners.
- Perform service operations on a clean bench, free from all mineral oil materials.
- Use of tire sizes other than those recommended may result in a reduction in the optimal performance of the antilock brake system and possibly set a wheel speed DTC.

FILLING MASTER CYLINDER RESERVOIRS

Refer to section 5A for information on filling master cylinder reservoirs.

BLEEDING BRAKE HYDRAULIC SYSTEM

Refer to section 5 for information on manual and pressure bleeding procedures. If desired brake pedal height results are not achieved, perform Auto Bleed Procedure outlined in this section.

Auto Bleed Procedure

The Auto Bleed Procedure is used to provide a complete brake system bleed on Bosch 5 equipped vehicles. The procedure cycles the system valves and runs the pump to purge air from secondary circuits normally closed off during non-ABS/TCS mode operation and bleeding. It is to be used when it is suspected that air has been ingested into the system secondary circuits, or when the Brake Pressure Modulator Valve (BPMV) has been replaced with a new unit.

To perform this procedure successfully, the following are required:

- Tech One Scan Tool with MSC
- A pressure brake bleeder capable of producing at least 30 psi. with suitable adapters and filled with Delco Supreme 11 brake fluid obtained from a sealed container.
- A hoist, or suitable stands to support vehicle.
- A bleeder bottle to receive vented brake fluid. The bottle should be constructed of unbreakable plastic, and should have a clear plastic hose sized to fit snugly on the bleeder valves. The hose should protrude into the bottle, with its end immersed in brake fluid.
- An assistant to pump the brake pedal during the procedure.
- Suitable safety attire, including safety glasses.

Figure 2-Brake Pipe location

BLEED INSTRUCTIONS

! Important

The Auto Bleed Procedure may be terminated at any time during the process by pressing the "EXIT" button. No further Tech One prompts pertaining to the Auto Bleed procedure will be given. After pressing "EXIT", relieve bleed pressure and disconnect bleed head from master cylinder, following bleed equipment manufacturers instructions.

1. Raise vehicle and support. Refer to GENERAL INFORMATION (Sect. 0A)
2. Remove all four wheels.
3. Inspect brake system for leaks or component damage. Correct all conditions found before starting procedure.
4. Assure vehicle battery is fully charged before beginning procedure.
5. Connect Tech One to DLC.
6. Turn Ignition to "RUN", do not start engine.
7. Establish communications with Tech One and select ABS/TCS system features.
8. Press "F4: Misc. Tests"
9. Select "Automated Bleed Procedure."
10. Bleed base brake system as instructed in GENERAL BRAKES (Sect. 5).
11. Press "UP" button. This conducts several tests which determine whether the ABS/TCS system condition is such that the bleed procedure can be performed. If any malfunctions are detected, the

bleed procedure will be aborted. If DTCs are present, the Tech One will display "DTCs PRESENT", or list the DTCs, depending on when the DTCs were set. DTCs can be displayed or cleared as appropriate in the "F2: Trouble Codes" mode. Refer to correct Service Manual section for those DTCs. If test is aborted but no DTCs are listed, go to the "ABS Diagnostic System Check" in this section. Correct all system malfunctions before attempting the bleed procedure again. If a road test is required for diagnosis and brake pedal is "spongy", perform a conventional brake bleed, achieving a firm pedal before driving vehicle.

12. Connect pressure bleed equipment described earlier, following manufacturer's instructions. Press "UP" button.
13. Apply bleed pressure, minimum 30 psi. Check for leaks at master cylinder reservoir bleeder cap and correct, if necessary.
14. Have assistant pump brake pedal continuously from this point on, making long, steady strokes. Press "UP".
15. Open left rear bleeder screw, use bleeder bottle. Press "ENTER" when prompted.
16. Close left rear bleeder screw when prompted. Press "UP" button.
17. Left rear bleed complete.
 - Repeat steps 15 through 17 on the right rear brake.
18. Open right front bleeder screw, use bleeder bottle. Press "ENTER".

5E1-56 ANTILOCK BRAKE SYSTEM (ABS)

19. Have assistant pump brake pedal continuously, making long, steady strokes. Press "UP".
20. Close right front bleeder screw when prompted. Press "UP" button.
21. Right front bleed complete.
 - Repeat steps 18 through 21 on the left front brake.

At this time, the Tech One performs several tests to re-verify system operation. The Tech One does not verify bleed success. If any malfunctions are detected, relieve bleed pressure and disconnect bleed equipment, following manufacturer's instructions. If DTCs are present, the Tech One will display them. DTCs can be cleared in the "F2: Trouble Codes" mode. Press "EXIT" to return to Tech One main menu. Refer to correct Service Manual section for DTCs found. If test is aborted but no DTCs are listed, go to the "ABS Diagnostic System Check" in this section. Correct all system malfunctions before attempting to repeat the bleed procedure.

22. If screen displays "BLEED PROCEDURE COMPLETE", press "UP" button.
23. Release bleed pressure, following bleed equipment manufacturer's instructions. Press "UP" button.
24. Disconnect bleed equipment. Clean up any spilled brake fluid by wiping up as much as possible, then flushing area with water. Do not allow any water to enter master cylinder reservoir. Press "EXIT".
25. Depress brake pedal. It should be high and firm. If not, re-inspect brake system thoroughly for any conditions which could cause excess brake pedal travel. See Section 5 for details. If brake system is OK, and excess pedal travel persists, repeat Auto Bleed Procedure.
26. Turn ignition "Off."
27. Disconnect Tech 1. Reinstall wheels and tires and lower vehicle. Check brake fluid level in reservoir and fill if necessary. Road test vehicle, making several ABS actuations in a suitable area. Brake pedal should remain high and firm after road test.

HYDRAULIC COMPONENTS

NOTICE: The use of rubber hoses or parts other than those specified for the ABS may lead to functional problems requiring major overhaul.

Brake Pressure Modulator Valve (BPMV)

Figure 2, 3

CAUTION: The brake pressure modulator valve must not be repaired, the complete unit must be replaced. No screws on the brake pressure modulator valve may be loosened. If screws are loosened, it will not be possible to get the brake circuits leak-tight, and personal injury may result.

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 6D1.

Remove or Disconnect

1. Battery negative cable.
2. Air intake duct and resonator assembly. refer to SECTION 6E3.
3. EBCM electrical connector
 - Unlock tab before removing connector.
4. BPMV motor ground cable connector.
5. EBCM insulators and three EBCM/BPMV assembly to bracket nuts.
6. Five brake pipes from BPMV.
 - Plug pipes to prevent loss of fluid and entrance of dirt.

Important

- Note location of brake pipes for aid during installation.
7. BPMV from vehicle.
 8. EBCM (as outlined in this section).
 - Transfer ground cable (if replacing BPMV).

Tighten

- Nut to 2.8 N.m (25lb. In.).

NOTICE: When removing the BPMV, protect vehicle exterior from possible brake fluid spillage.

Important

- Reposition brake pipes only as necessary to remove BPMV. Excessive bending of brake pipes may damage them.

Clean

- Any brake fluid spillage from the BPMV.

Install or Connect

NOTICE: See "Fasteners Notice" on page 5E1-1.

1. EBCM to BPMV.

Tighten

- Four mounting bolts to 2.6 N.m (23 lb. in.). Insulator bolt to 15 N.m (11 lb. ft.).
2. Position EBCM/BPMV assembly in bracket and install insulators and bracket nuts.

Tighten

- Three nuts to 10 N.m (89 lb. In.).
3. If a new BPMV is being installed, remove shipping plugs from valve openings.

- 1 EBCM/BPMV
- 2 EBCM/BPMV MOUNTING BRACKET
- 3 BRACKET MOUNTING BOLT
- 4 EBCM/BPMV BRACKET TO STEERING GEAR NUT
- 5 EBCM/BPMV MOUNTING INSULATOR

- 8 BRAKE PRESSURE MODULATOR VALVE (BPMV)
- 9 PUMP MOTOR (NOT SERVICEABLE, INTEGRAL TO BPMV)
- 10 VALVE RELAY (NOT SERVICEABLE, INTEGRAL TO EBCM)
- 11 PUMP MOTOR RELAY (NOT SERVICEABLE, INTEGRAL TO EBCM)
- 12 EBCM SEAL
- 13 EBCM TO BPMV BOLT
- 14 INSULATOR MOUNTING BOLT

05-01-95
BT0195E1

Figure 3-EBCM/BPMV assembly

5E1-58 ANTILOCK BRAKE SYSTEM (ABS)

CAUTION: Make sure brake pipes are correctly connected to brake pressure modulator valve. If brake pipes are switched by mistake (inlet vs. outlet) wheel lockup will occur and personal injury may result. The only two ways this condition can be detected are by using the Tech 1, or during an ABS event.

4. 5 Brake pipes to BPMV.

Important

- Use locations noted during removal.

Tighten

- Brake pipe Fittings at BPMV to 16 N.m (12 lb. Ft).
5. Pump motor ground cable connector.
 6. EBCM electrical connector.
 - Lock tab.
 7. Air intake duct and resonator assembly.
 8. Battery negative cable.
 9. Fill and bleed brake hydraulic system. Refer to SECTION 5.
 10. Perform ABS Diagnostic System Check. Refer to "Diagnosis" in this section.

Brake Pressure Modulator Valve (BPMV) Bracket

Figure 3

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 6D1.

Remove or Disconnect

1. BPMV from bracket. Refer to BPMV removal in this section.
 - Position assembly inboard far enough to gain access to bracket.

CAUTION: Be careful not to damage brake pipes.

2. Nut attaching bracket to steering gear.
3. Two bolts/screws attaching bracket to frame.
4. Bracket

Install or Connect

NOTICE: See "Fasteners Notice" on page 5E1-1.

1. Bracket
2. Two bolts/screws attaching bracket to frame.

Tighten

- Two bolts/screws to 24 N.m (18 lb. ft.).
3. Nut attaching bracket to steering gear.

Tighten

- Nut to 24 N.m (18 lb. ft.)
4. Reposition EBCM/BPMV assembly in bracket and attach. Refer to BPMV installation in this section.

ELECTRONIC BRAKE CONTROL MODULE (EBCM)

Figure 3

NOTICE: Always connect or disconnect the wiring harness from the EBCM with the ignition switch in the "OFF" position.

Important

- The EBCM cannot be repaired. It must be replaced as an assembly, if faulty.

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 6D1.

1. Battery negative cable.
2. Air intake duct resonator assembly. Refer to section 6E3.
 - Clean EBCM/BPMV assembly to prevent dirt intrusion.
3. Loosen and move wire harness from bracket.
4. EBCM electrical connector.
 - Unlock tab before removing connector.
5. EBCM/BPMV assembly-to-bracket nuts.
 - Remove EBCM mounting insulator.
6. Brake pipe clip bolt downstream from EBCM/BPMV assembly.
 - Lift EBCM/BPMV assembly and support with wood block.
7. 4 EBCM to BPMV bolts.
8. Front insulator mounting bolt.
9. EBCM from BPMV.

Important

- Be careful not to damage EBCM seal or flex lead on solenoid valves in the BPMV by prying. If BPMV seal area, or connector is damaged from removal, replace BPMV.
10. Inspect for brake fluid and/or corrosion in EBCM/BPMV cavity.

Install or Connect

NOTICE: See "Fasteners Notice" on page 5E1-1.

1. EBCM to BPMV.

Tighten

- Four EBCM to BPMV bolts to 2.6 N.m (23 lb. in.). Insulator mounting bolt to 15 N.m (11 lb. ft.).

2. Remove wood block and position EBCM/BPMV assembly in bracket.
3. Brake clip bolt downstream from EBCM/BPMV assembly.
4. Install mounting insulators, (if removed) and EBCM/BPMV assembly-to-bracket nuts.

Tighten

- Nuts to 10 N.m (89 lb. in.)
5. EBCM electrical connector.
 - Lock tab.
 6. Wire harness to bracket.
 7. Air intake duct and resonator assembly.
 8. Battery negative cable.
 9. Perform ABS Diagnostic System Check. Refer to "Diagnosis" in this section.

WHEEL SPEED SENSORS

Figures 4,5,6,&7

Right or Left Front Wheel Speed Sensor

Figure 4 and 5

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.

2. Left-hand or right-hand body harness connector and wheel speed sensor connector from clip.
3. Left-hand or right-hand body harness connector from wheel speed sensor connector.
4. Bolt/screw and bracket from frame rail.
5. Wheel speed sensor with grommets from brackets and if removing right-hand wheel speed sensor, brake pipe clip.
 - Note position of grommets and harness routing for installation.
6. Sensor retaining bolt/screw.
7. Front wheel speed sensor from steering knuckle.

Inspect

- Sensor face for accumulation of metallic particles, dirt, grease or other contaminants. Clean sensor face as required.
- Sensor face should show no evidence of damage or contact with the toothed sensor ring. If damage is noted, determine the cause and correct. Replace sensor if damage interferes with proper operation.

Figure 4-front Wheel Speed Sensor

Figure 5—Front Wheel Speed Sensor (Typical)

Install or Connect

NOTICE: The wheel speed sensors are a tight fit into the knuckle and are to be pushed in by hand. DO NOT force the sensors into position. There are two individual wheel speed sensors that must be installed in their respective locations. Each replacement wheel speed sensor is identified with a white tag, located near the neck of the sensor and labeled L (left) or R (right) or a white letter on the wire. The wheel speed sensors must be given an anticorrosion coating before installation to prevent corrosion. Do not use grease. Use sealer, GM P/N 12345489 or equivalent.

NOTICE: See “fasteners Notice” on page 5E1-1.

1. Front wheel speed sensor into steering knuckle.
2. Sensor retaining bolt/screw.

Tighten

- Bolt/screw to 8 N·m (71 lb. in.).
3. Wheel speed sensor with grommets to brackets, and if installing right-hand wheel speed sensor brake pipe clip.

Important

- Proper installation of wheel speed sensor wire is critical to continued system operation. Be sure that the wire is installed in brackets. Failure to install the wire in brackets as shown in this section may result in contact with moving parts, spark plug wires, and/or over extension of the wire, resulting in circuit damage.

4. Bracket and bolt/screw to frame rail.

Tighten

- Bolt/screw to 10 N·m (89 lb. in.).
5. Wheel speed sensor connector to body harness connector.
 6. Wheel speed sensor connector and body harness connector into clip.
 7. Lower vehicle.
 8. Perform ABS Diagnostic System Check. Refer to “Diagnosis” in this section.

Front Wheel Speed Sensor Ring

The front wheel speed sensor ring is an integral part of the front brake rotor. The sensor ring is accessible for inspection by removing the brake rotor.

If sensor ring replacement is required, the brake rotor must be replaced. For brake rotor service procedures, refer to SECTION 5B1.

Important

- Inspect toothed sensor rings for missing or cracked teeth. Missing or damaged teeth can result in poor sensor signals.
- Toothed sensor rings should show no evidence of contact with the wheel speed sensor. If contact is observed, determine cause and correct.
- Excessive runout of the sensor ring can cause erratic wheel speed sensor signals. Replace the toothed sensor ring if runout exceeds approximately 0.25 mm (0.010 inch).

Rear Wheel Speed Sensor

Figures 6 and 7

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Wheel speed sensor connector from electronic brake control wiring harness connector.
 - Unclip connectors from clip and separate.
3. Wiring harness with grommets from brackets.
 - Note position of grommets and harness routing for installation.
4. Bolt/screw and bracket from rear axle housing if removing rear axle.
5. Sensor retaining bolt/screw.
6. Rear wheel speed sensor from rear axle housing.

Figure 7-Rear Wheel Speed sensor

Inspect

- Sensor face for accumulation of metallic particles, dirt, grease or other contaminants.
- Clean sensor face as required.
- Sensor face should show no evidence of damage from contact with the toothed sensor ring. If damage is noted, determine the cause and correct. Replace sensor if damage interferes with proper operation.

Install or Connect

NOTICE: See “Fasteners Notice” on page 5E1-1.

NOTICE: The wheel speed sensor is a tight fit into the rear axle housing and is to be pushed in by hand. DO NOT force the sensor into position. Wheel speed sensors must be given an anti corrosion coating before installation to prevent corrosion. Do not use grease. Use sealer, GM P/N 12345489 or equivalent.

1. Rear wheel speed sensor into rear axle housing.
2. Sensor retaining bolt/screw.

Tighten

- Bolt/screw to 8 N.m (71 lb. in.).
3. Bracket and bolt/screw to rear axle housing if removed.

Tighten

- Bolt/screw to 8 N.m (71 lb. in.).
4. Wiring harness with grommets to brackets.

Important

- Proper installation of wheel speed sensor wire is critical to continued system operation. Be sure that the wire is installed in brackets. Failure to install the wire in brackets as shown in this section may result in contact with moving parts and/or over-extension of the wire, resulting in an open circuit.
5. Wheel speed sensor connector to electronic brake control wiring harness connector.
 - A. Make sure connection is tight.
 - B. Snap connectors into clip.
 6. Lower vehicle.
 7. Perform ABS Diagnostic System Check. Refer to “Diagnosis” in this section.

Rear Wheel Speed Sensor Ring

The rear wheel speed sensor ring is an integral part of rear axle differential drive pinion gear and may be inspected by removing the wheel speed sensor and

using a flashlight and mirror to inspect through the rear axle speed sensor mounting hole. If sensor ring replacement is required, the entire differential drive pinion gear must be removed. Refer to SECTION 4B.

Important

- Inspect toothed sensor rings for missing or damaged teeth. Missing or damaged teeth can result in erratic sensor signals.
- Toothed sensor rings should show no evidence of contact with the rear wheel speed sensor. If contact is observed determine cause and correct.
- Excessive runout of the sensor ring can cause erratic wheel speed sensor signals. Refer to section 4B for diagnostic and replacement procedures.

WARNING/INDICATOR LAMPS

For service information on the “ABS” indicator or “BRAKE” warning lamps, refer to section 8C.

EBCM ELECTRICAL CONNECTOR REPAIR

NOTICE: Always connect or disconnect the wiring harness connector from the EBCM with the ignition switch in the “OFF” position.

For general wiring and terminal repair procedures, see section 8A-5. The following repair procedure is for the ABS EBCM wiring harness connector.

1. Cut wire tie at connector head.
 - Be careful not to damage boot.
2. Remove connector center screw and screw seal.
3. Pull boot back until it is completely inside out. Wipe mastic material off boot and connector cover. New mastic will be used during reassembly.
4. Remove screws and loosen clamp attached to connector.
5. Remove rectangular connector seal and discard if damaged.
6. Push white contact carrier away from outer black shell.
7. Unlock connector lock by pushing with thumbs.
8. Replace terminals as needed using repair procedures described in Section 8A-5.
9. Take care to repair one wire at a time, replacing it into its proper cavity.
10. Reassemble connector using new components from service kit. New mastic and wire tie will be required for reassembly. Wrap the mastic twice around the wire groove area. Return the boot to its regular position and install new wire tie.

PARKING BRAKE

CAUTION: When servicing brake parts, do not create dust by grinding, sanding brake linings, or by cleaning brake parts with a dry brush or compressed air. Many brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm. A water dampened cloth or water based solution should be used to remove any dust on brake parts. Equipment is commercially available to perform this washing function. These wet methods will prevent asbestos fibers from becoming airborne.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

PARKING BRAKE SYSTEM

The parking brake system is applied by depressing the parking brake pedal. Applying the parking brake pedal places tension on the parking brake cables, which actuates the rear parking brake mechanism. This system mechanically forces the rear brake shoes against the brake drums which locks the rear brakes.

Chevrolet's police vehicle, Impala SS, and certain taxi applications are equipped with four-wheel disc braking systems. The parking brake system on vehicles equipped with rear disc braking systems uses brake shoes which are located inside the rear brake rotors. The brake shoes are mechanically applied to brake drums which are cast to the rear brake rotors.

PARKING BRAKE LEVER

The lever, mounted on the driver's side door hinge pillar left of the brake pedal, is a ratcheting mechanism which must be pumped to set. Up to

3 1/2 full strokes of the pedal are required to fully apply the lever. Low pedal resistance may be felt during the first stroke of the lever application.

Parking brake pedal travel may increase with mileage as the rear brake linings wear. The parking brake system should be adjusted if a firm parking brake pedal feel is not achieved with less than 3 1/2 pedal strokes.

PARKING BRAKE CABLES

Two separate cables are used in the parking brake system. The front and rear cables are joined at the equalizer, with the rear cable running to the rear of the vehicle.

This vehicle is equipped with coated parking brake cables. The wire strand is coated with a plastic material which slides over plastic seals inside the conduit end fittings. This is for corrosion protection and reduced parking brake effort.

BRAKE WARNING LAMP

The red "BRAKE" warning lamp will light when the ignition switch is in the "START" position

5F-2 PARKING BRAKE

or the pedal is applied or not fully released. The parking brake indicator switch, located in the parking brake pedal, grounds the "BRAKE" warning lamp circuit, causing the "BRAKE" warning lamp to light. For further information on the "BRAKE" warning lamp, refer to SECTION 5.

ON-VEHICLE SERVICE

PARKING BRAKE LEVER

Figures 1 through 3

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Loosen equalizer (19) to relieve tension on parking cable.
3. Lower vehicle.
4. Parking brake release handle (1) at lever (2).
5. Front cable (4) and casing at lever (2).
 - Use 1/2-inch box wrench to compress spring lock, then remove cable casing.
6. Nuts (3) and bolt/screw (6).
7. Electrical connector (9).
8. Lever (2).

Install or Connect

NOTICE: Refer to "Notice" on page 5F-1 of this section.

1. Lever (2).
2. Electrical connector (9).
3. Bolt/screw (6) and nuts (3).

Tighten

- Bolt/screw (6) to 25 N·m (18 lb. ft.).
 - Nuts (3) to 17 N·m (13 lb. ft.).
4. Front cable (4) and casing at lever (2).
 - Seat spring lock.
 5. Parking brake release handle (1) at lever (2).
 6. Raise and suitably support vehicle. Refer to SECTION 0A.

Adjust

- Parking brake. Refer to "Adjustment" in this section.
7. Lower vehicle.

PARKING BRAKE INDICATOR SWITCH

Figure 1

Remove or Disconnect

1. Electrical connector (9) from indicator switch (7).
2. Bolt/screw (8) attaching indicator switch (7) to lever (2).
3. Indicator switch (7).

Install or Connect

NOTICE: Refer to "Notice" on page 5F-1 of this section.

1. Indicator switch (7).
2. Bolt/screw (8) attaching indicator switch (7) to lever (2).

Tighten

- Bolt/screw (8) to 2.8 N·m (25 lb. in.).
3. Electrical connector (9) to indicator switch (7).

PARKING BRAKE RELEASE HANDLE

Figure 1

Remove or Disconnect

1. End of front parking brake cable from lever (2).
2. Front parking brake cable casing from lever (2).
3. Release handle (1) from lower instrument panel carrier.

Install or Connect

1. Release handle (1) to lower instrument panel carrier.
2. Front parking brake cable casing to lever (2).
3. End of front parking brake cable to lever (2).

PARKING BRAKE CABLES

NOTICE: Handling these cables while servicing the parking brake system requires extra care. Damage to the plastic coating will reduce corrosion protection and if the damaged area passes through the seal, increased parking brake effort could result. Contacting the coating with sharp-edged tools, or with sharp surfaces of the vehicle underbody, should be avoided. To prevent damage to the threaded parking brake, the following is recommended:

1. Before attempting to turn adjusting nut, clean exposed threads on each side of nut.
2. Lubricate threads of adjusting rod before turning nut.

Figure 2 - Parking Brake Front Cable Routing

Front Parking Brake Cables

Figures 1 through 4

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Loosen equalizer (19) enough to gain necessary front cable slack.
3. Front cable (4) at retainer.
4. Cable casing at frame (15).
 - Use a 1/2-inch box wrench to compress spring, then remove cable casing.
5. Lower vehicle.
6. Driver's side wheelhouse panel bolts/screws (51 and 52) and pull out panel (50) to gain access to front cable (4).
7. Front cable (4) and casing at lever (2).
 - Use a 1/2-inch box wrench to compress spring, then remove cable casing.
8. Front cable (4) and grommet (5) from vehicle.

Install or Connect

NOTICE: Refer to "Notice" on page 5F-1 of this section.

1. Front cable (4) and grommet (5).
2. Front cable (4) and casing at lever (2).
 - Seat spring lock.
3. Front wheelhouse panel (50) and wheelhouse panel bolts/screws (51 and 52).

Tighten

- Wheelhouse panel bolts/screws (51) to 10 N.m (89 lb. in.).
 - Wheelhouse panel bolts/screws (52) to 25 N.m (18 lb. ft.).
4. Raise and suitably support vehicle. Refer to SECTION 0A.
 5. Cable casing at frame (15).
 - Seat spring lock.
 6. Front cable (4) at retainer.

Adjust

- Parking brake. Refer to "Adjustment" in this section.
7. Lower vehicle.

Rear Parking Brake Cables (Drum)

Figure 3

LEFT PARKING BRAKE REAR CABLE

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Loosen equalizer (19) enough to gain necessary cable slack.
3. Left rear cable (18) at retainer and equalizer (19).
4. Left rear tire and wheel. Refer to SECTION 3E.
5. Left rear brake drum (35).
6. Left rear brake shoes. Refer to SECTION 5C2.
7. Left rear cable (18) from left rear parking brake lever.

- Use a 1/2-inch box wrench to compress spring lock, then remove cable casing.

Install or Connect

1. Left rear cable (18) and casing into brake backing plate.
 - Seat spring lock.
2. Left rear cable (18) to left rear parking brake lever.
3. Left rear brake shoes.
4. Left rear brake drum (35). Refer to SECTION 5C2.
5. Left rear tire and wheel. Refer to SECTION 3E.
6. Left rear cable (18) to retainer and equalizer (19).

Adjust

- Parking brake. Refer to "Adjustment" in this section.

7. Lower vehicle.

RIGHT PARKING BRAKE REAR CABLE

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Right rear cable (17) from equalizer (19).
3. Right rear cable (17) and casing from frame (15).
 - Use a 1/2-inch box wrench to compress spring lock, then remove cable casing.

4. Right rear cable (17) and casing from axle housing clips (37).
5. Right rear tire and wheel. Refer to SECTION 3E.
6. Right rear brake drum (38).
7. Right rear brake shoes. Refer to SECTION 5C2.
8. Right rear cable (17) from right rear parking brake lever.
9. Right rear cable (17) and casing from brake backing plate.
 - Use a 1/2-inch box wrench to compress spring lock, then remove cable casing.

Install or Connect

1. Right rear cable (17) and casing into brake backing plate.
 - Seat spring lock.
2. Right rear cable (17) to right rear parking brake lever.
3. Right rear brake shoes. Refer to SECTION 5C2.
4. Right rear brake drum (38).
5. Right rear tire and wheel. Refer to SECTION 3E.
6. Right rear cable (17) and casing into axle housing clips (37).
7. Right rear cable (17) and casing into frame (15).
 - A. Be sure cable is routed correctly.
 - B. Seat spring lock.
8. Right rear cable (17) to equalizer (19).

Adjust

- Parking brake. Refer to "Adjustment" in this section.
9. Lower vehicle.

Rear Parking Brake Cables (Disc)

Figure 5

LEFT PARKING BRAKE REAR CABLE

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Loosen equalizer (19) enough to gain necessary cable slack.
3. Left rear cable (18) at retainer and equalizer (19).
4. Unhook left rear cable (18) from left rear parking brake actuator lever.
5. Left rear cable (18) and casing from mounting plate.
 - Use a 1/2-inch box wrench to compress spring lock, then remove cable casing.

Install or Connect

1. Left rear cable (18) and casing into mounting plate.
 - Seat spring lock.
2. Left rear cable (18) to left rear parking brake actuator lever.
3. Left rear cable (18) to retainer and equalizer.

5F-8 PARKING BRAKE

ADJUSTMENT

Figures 3 and 6

NOTICE: To prevent damage to threaded parking brake adjusting rod when servicing parking brake, the following is recommended:

1. Before attempting to turn adjusting nut, clean exposed threads on each side of nut.
2. Lubricate threads of adjusting rod before turning nut.

Adjust

1. Brakes, if drum type. Refer to SECTION 5C2.
2. Parking brake.
 - A. Press parking brake lever ten ratchet clicks.
 - B. Raise and suitably support vehicle. Refer to SECTION 0A.
 - C. Tighten adjuster nut at equalizer (19) until right rear wheel can just be turned rearward with two hands but cannot be turned forward.
 - D. Release parking brake.
 - Rear wheels should now turn freely.
3. Lower vehicle.
4. Cycle pedal several times.
5. Park brake system must be able to apply at least 112 N (250 lbs. ft.) of force to the front cables.

Measure

- A. Pedal travel
 - Pedal from released position with an applied force of 556 N (125 lbs.) must travel 113.0mm (5.25 in.) to 171.0 mm (6.75 in.).
6. Confirm that brake light on Instrument Panel illuminates when pedal is applied.

GENERAL INFORMATION

CLEANLINESS AND CARE

The L99 and LT1 engines are a combination of many machined, honed, polished, and lapped surfaces with tolerances that are measured in the ten-thousandths of an inch. When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly, to protect and lubricate the surfaced on initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated. Whenever valve train components are removed for service, they should be kept in order and they should be installed in the same locations, and with the same mating surfaces, as when removed. Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wiring harness or other electrical parts.

GENERAL INFORMATION ON ENGINE
SERVICE

! Important

- The following information on engine service should be noted carefully, as it is important in preventing damage and in contributing to reliable engine performance.

When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen resulting in a damaged oil pick-up unit.

Any time the air cleaner is removed, the intake opening should be covered. This will protect against accidental entrance of foreign material, which could follow that intake passage into the cylinder and cause extensive damage when the engine is started.

In the mechanical procedures described in this section, generally references will be made to the removal of equipment such as power steering pump,

6-2 ENGINE GENERAL INFORMATION AND MECHANICAL DIAGNOSIS

air conditioning compressor, etc. Should it become necessary to remove any such item to perform other services, refer to the appropriate section of this service manual for specific information.

ENGINE PERFORMANCE DIAGNOSIS

Engine performance diagnosis procedures are covered in Section 6E and should be consulted for diagnosis of any driveability, emissions, or "Service Engine Soon" light complaint.

- Refer to:
 - Section 6E - Driveability and Emissions - General Information.
 - Section 6E3 - Driveability and Emissions - Sequential Multiport Fuel Injection 4.3L RPO L99 & 5.7L RPO LT1 - VIN P.

ON-BOARD DIAGNOSTICS II (OBD II)

OBD II requires not only that emission components be monitored and tested, but that entire systems be tested as well. This diagnostic system now includes both active and passive tests. Operation of some of these systems, such as ignition control circuits, were already being monitored to provide better powertrain control. Additional system monitoring, such as catalyst efficiency, is being introduced with OBD II. The following is how OBD II monitoring and diagnostic testing is accomplished. For further information on OBD II diagnostics, refer to SECTION 6E.

HEATED OXYGEN SENSOR (H02S) MONITORING

The exhaust Heated Oxygen Sensor (H02S) monitoring diagnostic is designed to meet the following requirements:

- Monitor voltage and response rate of the primary (pre-catalyst) sensors.
- Monitor output voltage or response rate of any secondary sensors.
- Monitor the heating system for appropriate performance.

The heater circuit will be considered malfunctioning when its performance drops outside the manufacturer's specification. For further diagnostic information, refer to SECTION 6E.

CATALYST MONITORING

The OBD II catalyst monitor diagnostic measures oxygen storage capacity. To do this, oxygen sensors are installed before and after the Three-Way Catalytic Converter (TWC). Voltage variations between the sensors allow the PCM to measure the catalyst emission performance. When the TWC is operating properly, the post-catalyst oxygen sensor will have significantly less activity than the pre-catalyst oxygen sensor. This is because the TWC stores and releases oxygen as needed during its normal reduction and oxidation processes.

To help aid in these processes, most modern TWC's also contain a base metal known as cerium. Cerium has the ability to attract and release excess oxygen in the exhaust stream. This stabilizes the operation of the catalyst and enhances the effectiveness of the precious metals in converting undesirable by-products of combustion to harmless gasses. As a catalyst becomes less effective in promoting chemical reactions, its capacity to store and release oxygen generally degrades as well. The OBD II catalyst monitor diagnostic is based on an observed correlation between conversion efficiency and oxygen storage capacity. A good catalyst (e.g. 95% hydrocarbon conversion efficiency) will show a relatively flat output voltage on the post-catalyst (H02S). A poor catalyst (65% hydrocarbon conversion) will show peaks and valleys in output voltage. This indicates that the catalyst has lost some of its ability to process the exhaust gasses properly. The post-catalyst H02S is used to measure the oxygen storage/release capacity of the catalyst. From this we can infer the catalyst efficiency and the oxygen storage capacity of the catalyst. A high oxygen storage capacity indicates a good catalyst; low oxygen storage capacity indicates a catalyst that is failing. For further diagnostic information, refer to SECTION 6E.

MISFIRE MONITORING

Failure criteria for the misfire diagnostic includes the following:

- A level of misfire sufficient to result in emission levels exceeding 1.5 times the Federal Test Procedure (FTP) standard.
- A level of misfire sufficient to result in catalyst damage at the current operating condition (engine speed, engine load, and coolant temperature).
- A level of misfire sufficient to cause the vehicle to fail the California Inspection Maintenance (I/M) test.

Regulations require misfire monitoring under all positive speed and load conditions (defined as cruises, accelerations, and idle). The diagnostic must discriminate between single versus multiple cylinder misfiring. If a single cylinder misfires, the diagnostic must identify the specific cylinder and the conditions under which the misfire occurs. The misfire monitor diagnostic is based on the principle that crankshaft rotational velocity fluctuates as each cylinder contributes a power input. When the engine misfires, the crankshaft slows down momentarily. For non-catalyst damage misfire, the diagnostic will require between 1000 and 3200 engine revolutions to respond to the onset of a misfire, and up to 200 engine revolutions to respond to a catalyst damage misfire. The PCM monitors crankshaft rotational velocity using both the crankshaft and camshaft position sensors. The Malfunction Indicator Lamp (MIL) will turn on when misfire is detected for two consecutive trips, or there is a malfunction in two non-consecutive trips (not more than 80 trips apart) under similar engine speed, load and coolant temperature conditions. Flashing the MIL is intended to discourage the driver from operating the vehicle in this condition (to ease off the throttle) before catalyst

damage results. Rough roads may cause false misfire detections. A rough road will cause torque to be applied to the drive wheels and drivetrain. These torque spikes can temporarily and intermittently decrease the engine speed, and this may be detected as a false misfire. The solution to rough road misfire problems is to utilize the Anti-Lock Brake System (ABS) and/or ECM software to detect patterns characteristic of rough roads, and disable the diagnostic when rough roads are present. A feature that is incorporated into the OBD II system for diagnosing misfire problems is called "misfire accumulators." These "misfire accumulators" are basically a file on each engine cylinder. Anytime a cylinder misfires, the misfire diagnostic counts the misfire and notes in which cylinder it occurred. A misfire accumulator is maintained for each cylinder, and misfire accumulator data can be accessed by using a TECH 1. This will enable you to determine which cylinders misfired, even when dealing with a random misfire diagnostic trouble code (DTC). Misfire accumulator information will be found in the MISFIRE DATA sub-menu of the SPECIFIC ENG. MENU of the data list. For further diagnostic information, refer to SECTION 6E.

FUEL TRIM SYSTEM MONITORING

The operational theory for fuel trim includes monitoring the averages of long-term and short-term fuel trim. If these fuel trim values reach and stay at their limits for a period of time, a malfunction is indicated. The fuel trim diagnostic compares an average of long-term-trim value and short-term-trim value to rich and lean thresholds. If either value is within the thresholds, a pass is recorded. (The closed loop system still has control authority). If both values are outside of their thresholds, then a failure condition exists. This will cause a DTC to be stored, and the rich or lean condition to be recorded. The fuel trim diagnostic also conducts an intrusive test to determine if a rich condition is being caused by excessive vapor from the EVAP canister. OBD II's fuel trim monitoring system will be considered malfunctioning when it causes the emission levels to exceed the 1.5 times the Federal Test Procedure (FTP) standards. The operating conditions at the instant of fault detection must be stored in Freeze Frame data for the service technician. Like a misfire diagnostic, fuel trim faults do not have to occur on consecutive trips to store a DTC. The enabling criteria for system operation includes: coolant temperature, throttle position, vehicle speed, intake air temperature, long-term fuel trim learning (updating), engine speed/load values, and barometric pressure. For further diagnostic information, refer to SECTION 6E.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM MONITORING

The OBD II requirement states that the Exhaust Gas Recirculation (EGR) system must be monitored for abnormally low and high flow rate malfunctions. The diagnostic will consider the EGR malfunctioning when an EGR system component fails, or a change in the EGR flow rate results in the vehicle exceeding

1.5 times the Federal Test Procedure (FTP) emission standard. The (DTC) must set within two vehicle trips once the malfunction has been detected.

SECONDARY AIR INJECTION (AIR) SYSTEM MONITORING

OBD II diagnostics require monitoring for the presence of airflow in the exhaust stream, as well as functional monitoring of the secondary AIR pump, and any switching valves. For further diagnostic information, refer to SECTION 6E.

EVAPORATIVE EMISSION CANISTER PURGE VALVE MONITORING

OBD II diagnostics utilize an evaporative (EVAP) emission canister purge valve monitor which uses an EVAP diagnostic switch in the hose between the EVAP canister and purge valve to determine proper function of the EVAP purge valve. When the EVAP purge valve is closed (no purge), the switch should not indicate a vacuum. An EVAP purge valve stuck open will result in the switch consistently indicating the presence of vacuum at the switch. An EVAP purge valve stuck closed will result in the switch constantly indicating atmospheric pressure. A vacuum switch in the evaporative emission canister purge hose is the only additional piece of hardware required for this diagnostic.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR MONITORING

There are two separate Engine Coolant Temperature (ECT) sensor diagnostics; ECT out of range (high or low) and ECT input failed to enable closed loop within the proper time frame. The ECT out of range diagnostic monitors the temperature readings from the ECT sensor at approximately 100 millisecond intervals. For a fixed interval of time, the diagnostic counts the number of ECT readings outside of the sensor's expected output range. If the number of ECT readings in the high or low ranges exceeds a certain calibrated threshold, the sensor is indicated to be failed high or low accordingly. If a relatively small number of samples fall in either the high or low ranges, the sensor is diagnosed as intermittently out of range high or low. The intermittent diagnostic is not required by OBD II regulations, so no DTC is set. For further diagnostic information, refer to SECTION 6E.

ENGINE MECHANICAL DIAGNOSIS

The following diagnostic information covers common problems and possible causes. When the proper diagnosis is made, the problem should be corrected by adjustment, repair or part replacement as required. Refer to the appropriate section of the manual for these procedures.

ENGINE MISFIRE MECHANICAL DIAGNOSIS

This diagnostic chart will isolate any engine misfire due to a mechanical problem such as a faulty camshaft, leaking head gasket, etc. However, this chart will not isolate a crossed injector wire, faulty injector or any other electrical failure which may cause a misfire. Therefore, the "On Board Diagnostic System Check" must be performed first to insure the correct chart is followed for diagnosis of a misfire. Refer to SECTION 6E3-A, then refer to the following charts.

EXCESSIVE OIL LOSS

Excessive oil consumption, not due to leaks, is the use of 2 quarts (1.9L) or more of engine oil within 2,000 miles or 3,200 kilometers.

- External oil leaks. Tighten or replace bolts and/or replace gaskets and seals as necessary.
- Improper reading of oil level indicator (dipstick). Check oil with the vehicle on a level surface and allow adequate drain-down time.
- Improper oil viscosity. Use recommended SAE viscosity for prevailing temperatures. Refer to SECTION 0B for engine oil specifications.
- Continuous high speed driving, and/or severe usage such as trailer hauling, will normally cause decreased oil mileage.
- Crankcase ventilation system malfunctioning.
- Valve guides and/or valve stem seals worn, or seals omitted. Ream guides and install oversize service valves and/or new valve stem seals.
- Piston rings broken, improperly installed, worn, or not seated. Allow adequate time for rings to seat. Replace broken or worn rings as necessary.
- Piston improperly installed or misfitted.
- Intake manifold gasket leaking from underside of intake manifold. Replace intake manifold gasket.

OIL LEAK DIAGNOSIS

Most fluid oil leaks are easily located and repaired by visually finding the leak and replacing or repairing the necessary parts. On some occasions a fluid leak may be difficult to locate or repair. The following procedure may help in finding and repairing most leaks.

Finding the Leak

1. Identify the fluid, determine whether it is engine oil, automatic transmission fluid, power steering fluid, etc.
2. At what point is the fluid leaking from? After running the vehicle at normal operating temperature, park the vehicle over a large sheet of paper. After a few minutes, the approximate location of the leak should be found by drippings on the paper.
3. Visually check around the suspected components. Check around all gasket mating surfaces for leaks. A mirror is useful for finding leaks in areas that are hard to reach.

4. If the leak still can't be found, it may be necessary to clean the suspected area with a degreaser, steam or spray solvent. Clean the area well, then dry the area. Operate the vehicle for several miles at normal operating temperature and varying speeds. After operating the vehicle, visually check the suspected component. If leak still can't be located, try using the powder or black light and dye method.

POWDER METHOD

1. Clean the suspected area.
2. Apply an aerosol-type powder (such as foot powder) to the suspected area.
3. Operate the vehicle under normal operating conditions.
4. Visually inspect the suspected components. The leak path to the source should be found by tracing the white powder surface.

BLACK LIGHT AND DYE METHOD

A dye and light kit is available for finding leaks. Refer to the manufacturer's directions when using the kit.

1. Clean the suspected area.
2. Pour specified amount of dye into leaking component.
3. Operate the vehicle under normal operating conditions as directed in the kit.
4. Direct the light toward the suspected area. The dyed fluid will appear as a yellow path leading to the source.

Repairing the Leak

Once the origin of the leak has been pinpointed and traced back to its source, the cause of the leak must be determined, in order for it to be repaired properly. If a gasket is replaced, but the sealing flange is bent, the new gasket will not repair the leak. The bent flange must be repaired also. Before attempting to repair a leak, check to be sure that the following conditions are correct as they may cause a leak.

GASKETS

Inspect

- Fluid level/pressure too high.
- Crankcase ventilation system malfunctioning.
- Improperly tightened fasteners or dirty/damaged threads.
- Warped flanges or sealing surface.
- Scratches, burrs, or other damage to the sealing surface.
- Damaged, improper, or worn gasket.
- Cracking or porosity of the component.
- Improper sealant used (where applicable).

SEALS

- Fluid level/pressure is too high.
- Crankcase ventilation system malfunctioning.
- Damaged seal bore (scratched, burred, or nicked).
- Damaged or worn seal.
- Improper installation.
- Cracks in components.
- Shaft surface scratched, nicked, or damaged.
- Loose or worn bearing causing excess seal wear.

LOW OR NO OIL PRESSURE

- Low oil level. Fill to full mark on oil level indicator.
- Slow idle speed.
- Incorrect or malfunctioning oil pressure switch.
- Incorrect or malfunctioning oil pressure gage. Replace with proper gage.
- Improper oil viscosity or diluted oil. Install oil of proper viscosity for expected temperature, or install new oil if diluted with moisture or unburned fuel mixtures.
- Oil pump worn or dirty.
- Plugged oil filter.
- Oil pickup screen loose or plugged.
- Hole in oil pickup tube.
- Excessive bearing clearance. Replace if necessary.
- Cracked, porous or plugged oil galleries. Repair or replace block.
- Gallery plugs missing or misinstalled. Install plugs or repair as necessary.
- Camshaft worn, or poorly machined. Replace camshaft.

ENGINE NOISE DIAGNOSIS

There are four steps to diagnosing engine noise. You must determine:

1. Type of noise.
2. Under which operating conditions it exists.
3. At what rate, and at what location in the engine.
4. Compare sounds in other engines to make sure the condition is not normal.

Identify the type of noise. For example, a light rattle or a low rumble. Determine the exact operating conditions under which the noise appears. Remember, engine noises are generally synchronized to either speed (caused by the crankshaft, connecting rods, or pistons) or one half engine speed (valve train noises). Try to determine the rate at which the noise is occurring. This can be installing a timing light to the vehicle and comparing the number of times the sound is heard per flash of light. One sound per flash of light generally indicates valve train component failure, two sounds per flash generally indicates piston rod bearing, crankshaft, or piston pin failure.

MAIN BEARING NOISE

Damaged or worn main bearing noise is revealed by dull thuds or knocks which happen on every engine revolution, and this noise is loudest when the engine is under heavy load. Excessive crankshaft end play is indicated by an intermittent rap or knock sharper than a worn main bearing. Causes of main bearing noises include:

- Low oil pump pressure.
- Thin, diluted or dirty oil and/or filter.
- Excessive main bearing clearance.
- Excessive crankshaft endplay.
- Out-of-round crankshaft journals.
- Excessive belt tension.
- Loose crankshaft pulley.
- Loose flywheel or torque converter.
- Loose main bearing cap.

CONNECTING ROD BEARING NOISE

A damaged or worn connecting rod bearing will produce knock under all speeds. During the early stages of wear, connecting rod noise may be confused with piston slap or loose wrist pins. Connecting rod knock noise increases with engine speed and is at its loudest on deceleration. Causes of connecting rod bearing noise include:

- Excessive bearing clearance.
- Worn crankshaft connecting rod journal.
- Thin, diluted or dirty oil and/or filter.
- Low oil pressure.
- Crankshaft connecting rod journals out-of-round.
- Misaligned connecting rod.
- Connecting rod bolts not properly torqued.
- Wrong bearing inserts or misaligned bearing half.

TIMING GEAR OR CHAIN AND SPROCKET NOISES

Engines designed with timing gears, or those equipped with timing chain and sprockets, can produce different noises. The most common noise is a high frequency, light knocking sound. This sound will generally be the same in intensity whether the engine is idling, operating at high speeds, or under load. Causes of timing gear or chain and sprocket noises include:

- Worn timing chain and/or gears.
- Misaligned gears.
- Excessive backlash.
- Damaged tooth.
- Gear or sprocket loose on shaft.
- Too much end play in the camshaft or crankshaft.

PISTON NOISES

Piston pin, piston, and connecting rod noises are hard to separate. A loose piston pin, for example, causes a sharp double knock usually heard when the engine is idling, or during sudden acceleration then deceleration of the engine. A piston pin that has been improperly fitted will emit a light ticking noise that is

6-6 ENGINE GENERAL INFORMATION AND MECHANICAL DIAGNOSIS

more noticeable with no load on the engine. Excessive piston-to-cylinder bore clearance will cause piston slap noise. The noise is similar to a metallic knock, as if the piston were "slapping" the cylinder wall during its stroke. As with most engine noises, understanding the cause of the noise will help you imagine what the noise sounds like. An indication of piston slap is a decrease in noise as the engine is cold, the piston-to-bore clearance is greater and piston slap will be louder. Causes of piston noises include:

- Worn or loose piston pin or bushing.
- Improper fit of piston pin.
- Excessive piston-to-cylinder bore clearance (piston slap).
- Lack of lubrication.
- Carbon deposits on top of piston striking cylinder head.
- Worn or broken ring land.
- Broken or cracked piston.
- Misaligned connecting rods.
- Worn or damaged rings.
- Worn or out-of-round cylinder walls.
- Excessive ring land clearance.
- Insufficient ring-end gap clearance.
- Piston 180 degrees out of position.
- Incorrect piston cam grind.

VALVE MECHANISM OR VALVE TRAIN NOISES

A light tapping at one-half engine speed, or any varying frequency, can indicate a valve train problem. These tapping noises increase with engine speed. Before attempting to judge valve train noises, thoroughly warm up the engine. This will bring all engine components to a normal state of expansion. If one of the valve train components is suspected, remove the air cleaner resonator and tape off the air intake duct opening. With the engine running, disconnect one fuel injector connector while listening to the noise. If the noise diminishes, the valve train components for that cylinder should be thoroughly inspected. If the noise did not diminish, continue with the remaining cylinders (one at a time) until the faulty cylinder is identified. Refer to SECTION 6A4A for valve train component replacement. Causes of valve mechanism noises include:

- Broken or weak valve spring(s).
- Sticking or warped valves.
- Bent pushrods.
- Dirty, stuck, worn or defective valve lifters.
- Damaged or improperly machined camshaft lobes.
- Insufficient or poor oil supply to valve train (low oil pressure).
- Excessive valve stem-to-guide clearance.
- Worn valve guides.
- Worn rocker arms or pushrods.
- Broken rocker arm stud.
- Loose or worn rocker arm attachments.
- Missing or mispositioned lifter guides (roller lifter engines).

FLYWHEEL NOISES

A loose or cracked flywheel will produce an irregular thud or click. To test for a loose or cracked flywheel, operate the vehicle at approximately 20 mph (32km/h) and shut off the engine. If a thud is heard, the flywheel may be loose or damaged. This type of thud is loudest on deceleration. Loose torque converter-to-flywheel-to-crankshaft bolts will sound similar to bearing knock. This condition produces several raps during quick acceleration on a free running engine. Depending on the idle smoothness, when the transmission is in gear, the noise may not appear. Check the torque converter-to-flywheel and flywheel to crankshaft bolts before attempting to investigate any bearing-related knock.

NOTICE: Be sure the converter-to-flywheel bolts are not too long. Converter bolts that are too long may dimple the torque converter clutch apply surface causing a shudder condition.

ENGINE KNOCK DIAGNOSIS

Noises in engines are sometimes characteristic of the design. Compare the sounds in other engines to make sure the condition is not normal.

KNOCKS COLD AND CONTINUES FOR TWO TO THREE MINUTES AND INCREASES WITH TORQUE

- Flywheel contacting splash shield. Reposition splash shield.
- Loose or broken balancer or drive pulleys. Tighten or replace as necessary.
- Excessive piston-to-bore clearance. Replace piston.
- Bent connecting rod. Replace as needed.
- Cold engine piston knock usually disappears when the cylinder is grounded out. Cold engine piston knock which disappears in 1.5 minutes should be considered acceptable.

HEAVY KNOCK HOT WITH TORQUE APPLIED

- Broken balancer or pulley hub. Replace parts as necessary.
- Loose torque converter bolts. Refer to SECTION 7A for torque specification.
- Exhaust system grounded. Reposition as necessary.
- Flywheel cracked. Replace as necessary.
- Excessive main bearing clearance. Replace as necessary.
- Excessive rod bearing clearance. Replace as necessary.

LIGHT KNOCK HOT

- Detonation or spark knock. Refer to SECTION 6E3.
- Loose torque converter bolts. Refer to SECTION 7A for torque specification.

- Exhaust leak at manifold. Tighten bolts and/or replace manifold.
- Excessive rod bearing clearance. Replace bearings as necessary.

KNOCKS ON INITIAL START-UP, BUT ONLY LASTS A FEW SECONDS

- Improper oil viscosity. Install proper oil viscosity for expected temperatures. Refer to SECTION 0B for engine oil specifications.
- Hydraulic lifter bleed down. Clean, test and replace as necessary.
 - When the engine is stopped, some valves will be open. Spring pressure against lifters will tend to bleed lifter down. Attempts to repair should be made only if the problem is consistent.
 - An engine that is operated for only short periods between start-ups may have lifter noise that lasts for a few minutes. This is a normal condition.
- Excessive crankshaft end clearance. Replace crankshaft thrust bearing.
- Excessive front main bearing clearance. Replace worn parts.

KNOCKS AT IDLE HOT

- A/C compressor or generator bearing. Replace as necessary.
- Valve train. Replace parts as necessary.
- Improper oil viscosity. Install proper viscosity oil for expected temperature. Refer to SECTION 0B for engine oil specifications.
- Excessive piston pin clearance. Replace piston and pin.
- Connecting rod alignment. Check and replace rods as necessary.
- Loose crankshaft balancer. Torque and/or replace worn parts.
- Piston pin offset to wrong side. Install correct piston.

ENGINE COMPRESSION TEST

A compression pressure test is performed on the engine cylinders to determine the condition of the rings, valves and head gasket.

Remove or Disconnect

1. Run engine until it reaches normal operating temperature. Battery must be at or near full charge.
2. Turn engine off.

3. Electrical connectors from ignition coil.
4. Spark plugs from all cylinders.
5. Air cleaner resonator and air duct from throttle body.
 - Block throttle plate in open position.

Measure

- Engine compression.
 - A. Install compression gage into cylinder spark plug hole.
 - B. Have a helper crank the engine through at least four compression strokes in the cylinder being tested and check the readings on the gage at each stroke. Record the results.
 - C. Disconnect gage.
 - D. Repeat compression test for each cylinder.

Inspect

- Record compression readings from all cylinders. The lowest reading should not be less than 70 percent of the highest and no cylinder reading should be less than 689 kPa (100 psi).
- Problem areas can be identified as follows:
 - Normal - Compression builds up quick and evenly to specified compression on each cylinder.
 - Valves - Compression is low on first stroke and it does not tend to build up in following strokes. Compression does not improve much with the addition of oil. Use approximately three squirts from a plunger type oiler.
 - Head Gaskets - Leaking head gaskets give nearly the same test results as valve problems but may be recognized by engine coolant in the crankcase. Head gasket leakage between two cylinders will give low readings on both cylinders.

Install or Connect

1. Remove block from throttle plate.
2. Air cleaner resonator and air duct to throttle body.
3. Spark plugs.
4. Electrical connectors to ignition coil.

CHART A ENGINE MISFIRE MECHANICAL DIAGNOSIS

! IMPORTANT

**OBD II SYSTEM CHECK MUST BE
PERFORMED FIRST.**

REFER TO SECTION 6E3-A.

1. ARE THERE ANY OBVIOUS MECHANICAL NOISES?

NO

1. PERFORM VISUAL INSPECTION. CHECK SPARK PLUGS, WIRES, AND HOSES FOR PROPER HOOK UP AND DAMAGE.
2. IS THERE ANY APPARENT DAMAGE OR IMPROPERLY CONNECTED HOSES OR WIRES?

NO

1. REMOVE AND INSPECT SPARK PLUGS.
2. ARE ANY SPARK PLUGS CONTAMINATED WITH ENGINE COOLANT (THIS MAY SHOW UP AS A SPARK PLUG WHICH LOOKS EXCEPTIONALLY CLEAN)?

NO

1. ARE SPARK PLUG(S) CONTAMINATED WITH ENGINE OIL?

NO

1. PERFORM CYLINDER LEAK TEST. REFER TO "CYLINDER LEAK TEST" IN THIS SECTION.
2. DOES ENGINE PASS CYLINDER LEAK TEST?

YES

1. INSTALL SPARK PLUG(S). CHECK FOR CARBON TRACKING OF PLUG WIRES.
2. INSTALL A VACUUM GAUGE TO THE INTAKE MANIFOLD AND MEASURE MANIFOLD VACUUM WITH ENGINE AT IDLE AND RECORD.
3. DISCONNECT ALL VACUUM LINES FROM MANIFOLD AND PLUG ALL OPENINGS.
4. CHECK MANIFOLD VACUUM AGAIN WITH ENGINE AT IDLE.
5. ARE BOTH VACUUM READINGS THE SAME?

YES

A (CONTINUE ON NEXT PAGE)

YES

• REFER TO CHART B.

YES

• REPAIR OR REPLACE PARTS AS NECESSARY.

YES

• REMOVE CYLINDER HEAD AND GASKET. INSPECT AND REPAIR/REPLACE PARTS AS NECESSARY.

YES

• REMOVE INTAKE MANIFOLD. INSPECT MANIFOLD AND GASKET, IF O.K. REMOVE CYLINDER HEAD AND INSPECT VALVE GUIDES AND SEALS, IF O.K. REMOVE PISTON AND INSPECT PISTON, RINGS, AND CYLINDER FOR WEAR.

NO

• REPAIR AS DESCRIBED UNDER "CYLINDER LEAK TEST"

NO

B (CONTINUE ON NEXT PAGE)

(CONTINUE FROM PREVIOUS PAGE)

1. USING A SPRAY BOTTLE, LIGHTLY SPRAY THE SPARK PLUG WIRES AND DISTRIBUTOR/IGNITION MODULE WHILE LISTENING TO ENGINE.
2. DID THE ENGINE STUMBLE OR STALL?

NO

1. REMOVE INTAKE MANIFOLD AND CAREFULLY INSPECT INTAKE MANIFOLD GASKET AND TBI GASKET.
2. IS THERE ANY APPARENT DAMAGE OR PROBLEM WITH THE GASKETS OR SEALING SURFACE?

NO

1. WITH THE INTAKE MANIFOLD REMOVED, ROTATE THE ENGINE AND MEASURE CAMSHAFT LOBE LIFT (LIFTER MOVEMENT IN BORE).
2. IS CAMSHAFT WITHIN SPECIFICATIONS?

YES

1. IF PROBLEM IS STILL SUSPECTED TO BE MECHANICAL, REMOVE ENGINE AND PERFORM A COMPLETE DISASSEMBLY AND INSPECTION.

YES

- CHECK EACH VACUUM OPERATED ACCESSORY/ VACUUM LINE AND REPAIR ANY OPEN OR LEAKING COMPONENT.

- REPLACE SPARK PLUG WIRES AND/OR DISTRIBUTOR CAP AND ROTOR/IGNITION MODULE.

YES

- REPAIR OR REPLACE AS NECESSARY.

NO

- REPLACE CAMSHAFT.

Restoration
Parts

C7480

CHART B ENGINE MISFIRE MECHANICAL DIAGNOSIS

1. WITH THE ENGINE RUNNING, TRY TO DETERMINE IF THE NOISE IS TIMED TO CRANKSHAFT SPEED OR CAMSHAFT SPEED (USE TIMING LIGHT, TWO KNOCKS PER FLASH IS CRANKSHAFT, ONE KNOCK PER FLASH IS CAMSHAFT).
2. IS NOISE TIMED TO CRANKSHAFT SPEED?

NO

YES

1. IS NOISE TIMED TO CAMSHAFT SPEED?

• REMOVE ROD BEARINGS AND INSPECT BEARINGS AND JOURNALS FOR WEAR. IF O.K. REMOVE CRANKSHAFT AND INSPECT MAIN BEARINGS AND JOURNALS FOR WEAR. REPLACE PARTS AS NECESSARY.

YES

NO

1. REMOVE INTAKE MANIFOLD, ROTATE ENGINE AND MEASURE CAMSHAFT LOBE LIFT (LIFTER MOVEMENT IN BORE) AND COMPARE WITH SPECIFICATIONS IN SECTION 6A4A.
2. IS CAMSHAFT WITHIN SPECIFICATIONS?

• CHECK FOR LOOSE ACCESSORY ATTACHMENTS, FLYWHEEL, OR TORQUE CONVERTER.

YES

NO

1. REMOVE ROCKER ARMS, PUSHRODS AND LIFTERS. CAREFULLY INSPECT FOR EXCESSIVE WEAR OR DAMAGE, REPLACE PARTS AS NECESSARY.

• REPLACE CAMSHAFT.

SECTION 6A4A

4.3 AND 5.7 LITER V8 ENGINE ON-VEHICLE SERVICE RPO L99 -VIN W RPO LT1 - VIN P

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "On-Vehicle Service" and the SIR Components and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or unneeded SIR system repairs.

CAUTION: Before removing or installing any electrical unit, or when a tool or equipment could easily come in contact with "live" or "hot at all times" exposed electrical terminals, disconnect the battery negative cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the "OFF" or "LOCK" position.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

ON-VEHICLE SERVICE

FUEL SYSTEM PRESSURE RELIEF

CAUTION: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing fuel system components. After relieving system pressure, a small amount of fuel may be released when servicing fuel lines or connections. In order to reduce the chance of personal injury, cover fuel pipe fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when disconnect is completed.

Tool Required:

J 34730-FF Fuel Pressure Gage

1. Disconnect battery negative cable terminal to avoid possible fuel discharge if an additional attempt is made to start the engine.
2. Loosen fuel filler cap to relieve tank vapor pressure.
3. Remove air cleaner resonator bracket nuts and resonator.
 - Loosen clamp and slide resonator off studs.
4. Connect gage J 34730-FF to fuel pressure connection located at the back of the manifold on the fuel crossover pipe.
 - Wrap shop towel around fitting while connecting gage to avoid spilling.
5. Install bleed hose into an approved fuel container and open valve to bleed system pressure. Fuel connections are now safe for servicing.
6. Drain any fuel remaining in gage into approved fuel container.

SERPENTINE DRIVE BELT AND TENSIONER

Figures 1 and 2

NOTICE: Routine inspection of the belt may reveal cracks in the belt ribs. These cracks will not impair belt performance and therefore should not be considered a problem requiring belt replacement. However, the belt should be replaced if the belt causes belt slip to occur or if sections of the belt ribs are missing.

A single serpentine drive belt is used to drive all engine accessories. On vehicles with RPO V08 heavy-duty cooling system, an additional belt is used to drive the mechanical cooling fan. All belt driven accessories are rigidly mounted to the engine with belt tension maintained by a spring loaded tensioner.

Inspect

- The indicator just behind the tensioner pulley must fall within the acceptable range once the belt is installed. Refer to Figure 1. If the indicator mark on the tensioner does not fall within the acceptable range, check for proper installation of the belt before replacing the belt.

Drive Belts

Figure 1

Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

1. Battery negative cable.
2. Fan belt (198) from tensioner (40), if equipped with mechanical fan.
 - Use 13-mm wrench to rotate tensioner pulley clockwise while sliding belt (198) from tensioner pulley.
3. Fan belt (198) from pulleys (41 and 192), if equipped with mechanical fan.
4. Radiator outlet pipe nuts at air conditioning compressor, if equipped with mechanical fan. Refer to SECTION 6B.
5. Raise and suitably support vehicle, if equipped with mechanical fan. Refer to SECTION OA.
6. Serpentine drive belt (148) from tensioner (253).
 - Use 9/16-inch off-set wrench to rotate tensioner pulley clockwise while sliding belt (148) from tensioner pulley.
7. Serpentine drive belt (148) from accessory pulleys.

Clean

- Serpentine drive belt surfaces.

Remove or Disconnect

1. Serpentine drive belt (148) to accessory pulleys.
2. Serpentine drive belt (148) to tensioner (253).
 - Be sure drive belt (148) is aligned into proper grooves of accessory drive pulleys.
3. Lower vehicle.
4. Radiator outlet pipe nuts at air conditioning compressor, if removed. Refer to SECTION 6B.
5. Fan belt (198) to pulleys (41 and 192), if removed.
6. Fan belt (198) to tensioner (40), if removed.
7. Battery negative cable.

Drive Belt Tensioners

Figure 2

Remove or Disconnect

1. Radiator fan upper shroud, if equipped. Refer to SECTION 6B.
2. Drive belts. Refer to "Drive Belts" in this section.
3. Drive belt tensioner bolts/screws (150), if removing tensioner (40).
4. Tensioner (40) from bracket.
5. Raise and suitably support vehicle, if equipped with mechanical fan. Refer to SECTION OA.
6. Drive belt tensioner bolts/screws (152).

Figure 1 - Serpentine Drive Belt and Tensioner

7. Tensioner (253) from bracket.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Tensioner (253) to bracket.
2. Drive belt tensioner bolts/screws (152).

Tighten

- Drive belt tensioner bolts/screws (152) to 25 N.m (18 lb. ft.).
3. Lower vehicle.
 4. Tensioner (40) to bracket, if removed.
 5. Drive belt tensioner bolts/screws (150), if removed.

Tighten

- Drive belt tensioner bolts/screws (150) to 25 N.m (18 lb. ft.).

6. Drive belts. Refer to "Drive Belts" in this section.

7. Radiator fan upper shroud, if removed. Refer to SECTION 6B.

ENGINE MOUNTS AND BRACKETS

Figure 3

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan or any sheet metal. Due to small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen resulting in a damaged oil pickup unit.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Engine mount through-bolts/screws (216) and nuts (236).
3. Raise engine with a jacking fixture.

Figure 2 - Drive Belt Tensioner

4. Engine mount bolts/screws (237), engine mount nuts (238) and engine mount (208).
5. Engine mount bracket bolts/screws (215), washers (240) and engine mount brackets (239).

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Engine mount brackets (239), washers (240) and engine mount bracket bolts/screws (215).

Tighten

- Bolts/screws (215) to 47 N.m (35 lb. ft.).
2. Engine mount (208), engine mount bolts/screws (237) and engine mount nuts (238).

Tighten

- Engine mount bolts/screws (237) to 50 N.m (37 lb. ft.) -or- Engine mount nuts (238) to 48 N.m (35 lb. ft.).

3. Lower engine.
4. Engine mount through-bolts/screws (216) and nuts (236).

Tighten

- Engine mount through-bolts/screws (216) to 120 N.m (89 lb. ft.) -or- Nuts (236) to 80 N.m (59 lb. ft.).

5. Lower vehicle.

OIL LEVEL INDICATOR TUBE

Remove or Disconnect

1. Bolt/screw securing tube bracket to right lower side of engine block.
2. Level indicator tube from engine block.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Clean tube and apply sealant, GM P/N 12345493 or equivalent, around tube 12.7 mm (0.50 inch) below bead.
2. Tube into engine block and rotate into position.
3. Bolt/screw securing tube bracket.

Tighten

- Oil level indicator tube bolt/screw to 12 N.m (106 lb. in.).

INTAKE MANIFOLD

Figures 4 through 7

Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

Important

- This vehicle uses a sequential multiport fuel injected engine. Fuel injector connectors must be positioned onto their appropriate fuel injector or engine performance and exhaust emissions may be seriously affected. Fuel injector connectors are numbered to match their cylinders. If fuel injector connector numbers can not be identified, or are unreadable refer to SECTION 8A-20 for correct fuel injector connector wire color-to-fuel injector for each cylinder.

1. Battery negative cable.
2. Drain coolant. Refer to SECTION 6B.
3. Resonator bracket nuts (243).
4. Resonator (244).
 - Loosen clamp (242) and slide resonator (244) off studs (241).

Figure 3 - Engine Mounts and Brackets

Figure 4 - Fuel Rail and Throttle Body

Figure 5 - Intake Manifold

5. Throttle body air duct.
6. Wiring harness connectors from fuel injectors.
7. Left and right wiring harness clips.
 - Lay wiring harnesses aside.
8. Accelerator control cable at throttle body (3).
9. Accelerator control cable bracket bolts/screws and bracket from throttle body (3).
10. Relieve fuel system pressure. Refer to "Fuel System Pressure Relief" in this section.
11. Fuel pipe connectors from fuel rail. Refer to SECTION 6C.
12. Fuel rail bolts/screws (1).
13. Resonator bracket (26) with canister purge solenoid attached.
14. Fuel pressure regulator vacuum tube (7).
15. Fuel rail (2) from intake manifold (6) and lay aside.
16. Exhaust gas recirculation (EGR) and distributor vacuum harness and crankcase vent hoses.
 - Plug all open vacuum/vent hoses.
17. Exhaust gas recirculation (EGR) control valve relay solenoid nut and control valve relay.
18. EGR valve pipe nuts (14), bolt/screw (229), pipe (12) and gasket (22).
 - Discard gasket (22).
19. Engine wiring harness bracket and nuts at left front corner of intake manifold (6).
20. Coolant hoses from throttle body (3).
21. Throttle body bolts/screws (4), throttle body (3) and gasket (5).
22. Intake manifold bolts/screws (8) and studs (9).
23. Intake manifold (6) and gaskets (10).
 - Discard gaskets (10).

Clean

- Intake manifold bolts/screws (8) and studs (9).
- Cylinder head, engine block and intake manifold sealing surfaces.

Install or Connect

NOTICE: Refer to "NOTICE" on page 6A4A-1 of this section.

Figure 6 - Intake Manifold Tightening Sequence

1. Apply 5 mm (3/16-inch) bead of RTV sealer, GM P/N 1052366 or equivalent, to the front and rear of the engine block. Extend the bead 13 mm (1/2 inch) up each cylinder head to seal and retain the gaskets.
2. Intake manifold (6) with new gaskets (10).
3. Intake manifold bolts/screws (8) and studs (9).

Tighten

- Intake manifold bolts/screws (8) and studs (9) in a first pass to 8 N.m (71 lb. in.) in sequence as shown in Figure 6. Tighten in sequence in a second pass to final specifications of 48 N.m (35 lb. ft.).
4. Throttle body (3), gasket (5) and throttle body bolts/screws (4).

Tighten

- Throttle body bolts/screws (4) to 25 N.m (18 lb. ft.).
5. Coolant hoses to throttle body (3).
 6. Engine wiring harness bracket and nuts at left front corner of intake manifold (6).
 7. Gasket (22), EGR valve pipe (12), nuts (14) and bolt/screw (229).
 8. EGR control valve relay solenoid and nut.

Tighten

- EGR valve pipe nuts (14) to 25 N.m (18 lb. ft.).
 - EGR valve pipe bolt/screw (229) to 25 N.m (18 lb. ft.).
 - EGR control valve relay solenoid nut to 25 N.m (18 lb. ft.).
9. Exhaust Gas Recirculation (EGR) and distributor vacuum harness and crankcase vent hoses.
 10. Fuel rail (2) to intake manifold (6).
 11. Fuel pressure regulator vacuum tube (7).
 12. Resonator bracket (26) with canister purge solenoid attached.
 13. Fuel rail bolts/screws (1).

Tighten

- Fuel rail bolts/screws (1) to 10 N.m (89 lb. in.).
14. Fuel pipe connectors to fuel rail. Refer to SECTION 6C.
 15. Accelerator control cable bracket and bolts/screws to throttle body (3).

Tighten

- Accelerator control cable bracket and bolts/screws to 12 N.m (106 lb. in.).
16. Accelerator control cable at throttle body (3).
 17. Left and right wiring harness clips and harnesses.
 18. Wiring harness connectors to their appropriate fuel injector.

19. Throttle body air duct.
20. Resonator (244).
 - Slide resonator over studs (241) and tighten clamp (242) until snug.
21. Resonator bracket nuts (243).

Tighten

- Nuts (243) to 10 N.m (89 lb. in.).
22. Battery negative cable.
 23. Refill and bleed cooling system. Refer to SECTION 6B.

EXHAUST MANIFOLDS

Figures 7 and 8

Right Exhaust Manifold

Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

1. Battery negative cable.
2. Warm up three-way catalytic converter and gasket from exhaust manifold. Refer to SECTION 6F.
3. Oil level indicator tube. Refer to "Oil Level Indicator Tube" in this section.
4. Secondary air injection pipe fitting from exhaust manifold (19).
5. Generator rear lower braces. Refer to SECTION 6D3.
6. Exhaust manifold bolts/screws (21), studs (20) and spacers (245).
7. Exhaust manifold (19) and exhaust manifold gasket (18).

Clean

- Exhaust manifold and cylinder head sealing surfaces.
- Cylinder head exhaust manifold bolt/screw holes with a 3/8 inch - 16 NC tap, then flush out holes with brake cleaner solvent GM P/N 12345754 or equivalent.
- Exhaust manifold bolts/screws.

Install or Connect

NOTICE: Refer to "NOTICE" on page 6A4A-1 of this section.

1. Exhaust manifold gasket (18) and exhaust manifold (19).
 - Foil side of gasket (18) must face manifold (19).
2. Apply an 8mm (1/4 inch) band of GM PN 12345493 adhesive to bolts/screws (21) threads (figure 8).

3. Exhaust manifold spacers (245), studs (20) and bolts/screws (21).

 Tighten

- Exhaust manifold studs (20) and bolts/screws (21) to 35 N.m (26 lb. ft.).
4. Generator rear lower braces. Refer to SECTION 6D3.
 5. Oil level indicator tube. Refer to "Oil Level Indicator Tube" in this section.
 6. Warm up three-way catalytic converter and gasket to exhaust manifold. Refer to SECTION 6F.
 7. Secondary air injection pipe fitting to exhaust manifold (19).

 Tighten

- Secondary air injection pipe fitting to 55 N.m (41 lb. ft.).
8. Battery negative cable.

Left Exhaust Manifold

 Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

1. Battery negative cable.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Warm up three-way catalytic converter and gasket from exhaust manifold. Refer to SECTION 6F.
4. Lower vehicle.
5. Secondary air injection pipe fitting from exhaust manifold (16).
6. Exhaust manifold bolts/screws (21), spacers (245) and stud (20).
7. Exhaust manifold (16) and exhaust manifold gasket (17).

Figure 7 - Secondary Air Injection and EGR Valve Pipes

Clean

- Exhaust manifold and cylinder head sealing surfaces.
- Cylinder head exhaust manifold bolt/screw holes with a 3/8 inch - 16 NC tap, then flush out holes with brake cleaner solvent GM P/N 12345754 or equivalent.
- Exhaust manifold bolts/screws.

Install or Connect

NOTICE: Refer to "NOTICE" on page 6A4A-1 of this section.

1. Exhaust manifold gasket (17) and exhaust manifold (16).
 - Foil side of gasket must face manifold (16).
2. Apply an 8mm (1/4 inch) barrel of GM P/N 12345493 adhesive to bolts/screws (21) threads (Figure 8).
3. Exhaust manifold bolts/screws (21), studs (20) and spacers (245).

Tighten

- Exhaust manifold bolts/screws (21) and stud (20) to 35 N.m (26 lb. ft.).
4. Secondary air injection pipe fitting to exhaust manifold (16).

Tighten

- Secondary air injection pipe fitting to 55 N.m (41 lb. ft.).
5. Raise and suitably support vehicle. Refer to SECTION 0A.
 6. Warm up three-way catalytic converter and gasket to exhaust manifold. Refer to SECTION 6F.
 7. Lower vehicle.
 8. Battery negative cable.

VALVE ROCKER ARM COVERS

Figure 9

Right Cover

Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

1. Battery negative cable.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Serpentine drive belt from drive belt tensioner. Refer to "Serpentine Drive Belt and Tensioner" in this section.
4. Transmission fluid level indicator tube bracket from transmission housing and rear of cylinder head.

Figure 8 - Exhaust Manifolds

5. Lower vehicle.
6. Crankcase vent hose.
7. Generator. Refer to SECTION 6D3.
8. Rocker arm cover bolts/screws (24).
9. Rocker arm cover (23) and gasket (25).

Clean

- Rocker arm cover and cylinder head gasket surfaces.

Install or Connect

NOTICE: Refer to "NOTICE" on page 6A4A-1 of this section.

1. Gasket (25) and rocker arm cover (23).
2. Rocker arm cover bolts/screws (24).

Tighten

- Rocker arm cover bolts/screws (24) to 12 N.m (108 lb. in.).
3. Crankcase vent hose.
 4. Generator. Refer to SECTION 6D3.
 5. Raise and suitably support vehicle. Refer to SECTION 0A.
 6. Transmission fluid level indicator tube to transmission housing and rear of cylinder head.

7. Serpentine drive belt to drive belt tensioner. Refer to "Serpentine Drive Belt and Tensioner" in this section.
8. Lower vehicle.
9. Battery negative cable.

Left Cover

Install or Connect

1. Resonator bracket nuts (243).
2. Resonator (244).
 - Loosen clamp (242) and slide resonator (244) off studs (241).
3. Brake booster vacuum hose.
4. Rocker arm cover bolts/screws (24).
5. Rocker arm cover (23) and gasket (25).

Clean

- Rocker arm cover and cylinder head gasket surfaces.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Gasket (25) and rocker arm cover (23).
2. Rocker arm cover bolts/screws (24).

Tighten

- Rocker arm cover bolts/screws (24) to 12 N.m (106 lb. in.).
3. Brake booster vacuum hose.
 4. Resonator (244).
 - Slide resonator (244) over studs (241) and tighten clamp (242) snugly.
 5. Resonator bracket nuts (243).

Tighten

- Nuts (243) to 10 N.m (89 lb. in.).

VALVE ROCKER ARMS AND PUSHRODS

Figures 9 and 10

Install or Connect

1. Valve rocker arm covers. Refer to "Valve Rocker Arm Covers" in this section.
2. Rocker arm nuts (31) and rocker arm balls (30).
3. Rocker arms (29) and pushrods (27).
 - Place the rocker arms (29), rocker arm balls (30) and pushrods (27) in a rack so that they can be reinstalled in the same locations from which they were removed.

Figure 9 - Valve Rocker Arm Cover

! Important

- Refer to SECTION 6A4B for inspection of the rocker arms, studs and pushrods.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

! Important

- When installing rocker arms (29) and rocker arm balls (30), coat their bearing surfaces with prelude, GM P/N 1052365 or equivalent. Install these components and the pushrods (27) in the locations from which they were removed.

1. Pushrods (27).
 - Make sure pushrods (27) seat in lifter sockets.
2. Rocker arms (29).
3. Rocker arm balls (30) and rocker arm nuts (31).

⌚ Tighten

- Rocker arm nuts (31) until all lash is eliminated.

🔑 Adjust

1. Turn crankshaft until arrow on crankshaft hub (45) and balancer (42) are in 12 o'clock position and number 1 cylinder is in firing position (top dead center). Refer to Figure 15.
 - Watch number 1 cylinder valves as arrow approaches 12 o'clock position. If a valve moves as the arrow moves to position, the engine is in number 6 cylinder firing position. Crankshaft must then be turned one more time to reach number 1 cylinder firing position.
2. With engine in number 1 cylinder firing position, the following valves can be adjusted:
 - Exhaust 1, 3, 4, 8
 - Intake 1, 2, 5, 7
3. Back off rocker arm nut (31) until lash is felt in pushrod (27). Then tighten rocker arm nut (31) until all lash is removed. Zero lash can be felt by moving pushrod (27) up and down using thumb and forefinger until there is no more movement.
4. When all free play has been removed, tighten rocker arm nut (31) one additional turn.
5. Turn crankshaft one revolution until arrow is again at 12 o'clock position. This is number 6 cylinder firing position. The following valves can now be adjusted:
 - Exhaust 2, 5, 6, 7
 - Intake 3, 4, 6, 8
6. Install valve rocker arm covers. Refer to "Valve Rocker Arm Covers" in this section.

ROCKER ARM STUDS

Figures 10, 11 and 12

Tools Required:

- J 5802-01 Stud Remover
- J 5715 Reamer (0.0762 mm (0.003 inch) oversize)
- J 6036 Reamer (0.3302 mm (0.013 inch) oversize)
- J 6880 Stud Installer

Rocker arm studs that have damaged valve rocker arm nut threads should be replaced with new studs. This engine uses rocker arm studs that are pressed into the cylinder head. New studs are available in 0.0762 mm (0.003 inch) and 0.3302 mm (0.013 inch) oversize.

Figure 10 - Valve Rocker Arms and Pushrods

Figure 11 - Removing The Rocker Arm Stud

Remove or Disconnect

1. Valve rocker arm cover. Refer to "Valve Rocker Arm Covers" in this section.
2. Valve rocker arm. Refer to "Valve Rocker Arms and Pushrods" in this section.
3. Place J 5802-01 over the stud to be removed. Install a nut and flat washer. Remove the stud by turning the nut. Refer to Figure 11.
4. Ream the hole to the proper size for the replacement oversize stud. Use J 5715 for 0.0762 mm (0.003 inch) oversize studs; J 6036 for

Figure 12 - Reaming The Rocker Arm Stud Bore

Figure 13 - Installing The Rocker Arm Stud

0.3302 mm (0.013 inch) oversize studs. Refer to Figure 12.

5. Coat lower end (press fit area) of stud with hypoid axle lubricant. Drive stud into place with a hammer and J 6880. Stud is installed to proper depth when the tool bottoms on the cylinder head. Refer to Figure 13

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Apply sealer, GM P/N 1052080 or equivalent, to threads of new rocker arm stud.
2. Rocker arm stud (28).

Tighten

- Rocker arm stud (28) to 68 N.m (50 lb. ft.).
3. Valve rocker arms. Refer to "Valve Rocker Arms and Pushrods" in this section.
 4. Valve rocker arm cover. Refer to "Valve Rocker Arm Covers" in this section.

VALVE LIFTERS

Figure 14

Tools Required:

J 3049-A Hydraulic Valve Lifter Remover (Plier Type)

J 9290-01 Hydraulic Valve Lifter Remover (Slide Hammer Type)

Figure 14 - Valve Lifters

4.3L & 5.7L V8 ENGINE ON-VEHICLE SERVICE RPO L99 - VIN W & LT1 - VIN P 6A4A-13

No service parts are available for valve lifters. They are replaced as a unit when worn and when a new camshaft is installed.

Remove or Disconnect

1. Intake manifold. Refer to "Intake Manifold" in this section.
2. Valve rocker arm covers. Refer to "Valve Rocker Arm Covers" in this section.
3. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
4. Valve lifter guide retainer (33) and bolts/screws (32).
5. Valve lifter guide (35) and valve lifter (36).
 - Some valve lifters (36) may be stuck in their bores because of gum or varnish deposits. These valve lifters (36) can be removed using J 3049-A or J 9290-01.

Important

- Refer to SECTION 6A4B for inspection of the valve lifters.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Coat valve lifter rollers with prelube, GM P/N 1052365 or equivalent.

2. Valve lifters (36) in the same location from which they were removed.
3. Valve lifter guides (35), valve lifter guide retainer (33) and bolts/screws (32).
4. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
5. Valve rocker arm covers. Refer to "Valve Rocker Arm Covers" in this section.
6. Intake manifold. Refer to "Intake Manifold" in this section.

Tighten

- Bolts/screws (32) to 25 N·m (18 lb. ft.).

WATER PUMP

Figure 16

The water pump is gear driven by the camshaft sprocket using a drive shaft and coupling. Keep ignition wires connected to the distributor until the water pump is removed and all coolant has been drained.

Remove or Disconnect

1. Drain engine coolant. Refer to SECTION 6B.
2. Air cleaner resonator bracket nuts, if equipped with mechanical fan.
3. Air cleaner resonator, if equipped with mechanical fan.
 - Loosen clamp and slide resonator off studs.

Figure 15 - Crankshaft Balancer and Hub

6A4A-14 4.3L & 5.7L V8 ENGINE ON-VEHICLE SERVICE RPO L99 - VIN W & LT1 - VIN P

4. Air intake duct, if equipped with mechanical fan.
5. Radiator fan upper shroud, if equipped with mechanical fan. Refer to SECTION 6B.
6. Fan belt from tensioner, if equipped with mechanical fan.
7. Fan blade clutch nuts (247) and fan blade (249) with clutch attached, if equipped with mechanical fan.
8. Engine coolant and heater hoses from water pump (37).
9. Fan pulley (41), if equipped with mechanical fan.
10. Coolant fan pulley bracket nuts (132), if equipped with mechanical fan.
11. Coolant fan pulley bracket (130), if equipped with mechanical fan.
12. Electrical connector from coolant sensor.
13. Secondary air injection pump and bracket. Refer to SECTION 6E3.
14. Water pump bolts/screws (127 and 129) and stud (128).
15. Water pump (37) and gaskets (38).

16. Water pump driveshaft coupling (39) and seals (156).
 - Discard seals (156).

Clean

- Water pump gasket surfaces.
- Water pump bolts/screws (127 and 129).
- Coolant fan pulley bracket studs (131), if removed.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Water pump driveshaft coupling (39) and new seals (156).
2. Water pump (37) and gaskets (38).
3. Water pump bolts/screws (127 and 129) and stud (128).

Figure 16 - Water Pump

Tighten

- Bolts/screws (127 and 129) and stud (128) to 40 N.m (30 lb. ft.).
- 4. Secondary air injection pump and bracket. Refer to SECTION 6E3.
- 5. Electrical connector to coolant sensor.
- 6. Coolant fan pulley bracket (130), if removed.
- 7. Coolant fan pulley bracket nuts (132), if removed.

Tighten

- Nuts (132) to 50 N.m (37 lb. ft.).
- 8. Fan pulley (41), if removed.
- 9. Fan blade (249) with clutch attached and nuts (247), if removed.

Tighten

- Nuts (247) to 26 N.m (19 lb. ft.).
- 10. Engine coolant and heater hoses to water pump (37).
- 11. Fan belt to tensioner, if removed.
- 12. Radiator fan upper shroud, if removed. Refer to SECTION 6B.
- 13. Air intake duct, if removed.
- 14. Air cleaner resonator, if removed.
 - Slide resonator over studs and tighten clamp until snug.
- 15. Air cleaner resonator bracket nuts, if removed.

Tighten

- Nuts to 10 N.m (89 lb. in.).
- 16. Refill and bleed cooling system. Refer to SECTION 6B.

CRANKSHAFT BALANCER AND HUB

Figures 15 and 22

Tool Required:
J 39046 Crankshaft Hub Remover and Installer

Remove or Disconnect

1. Raise and suitably support vehicle, if equipped with mechanical fan. Refer to SECTION 0A.
2. Serpentine drive belt. Refer to "Serpentine Drive Belt and Tensioner" in this section.
3. Crankshaft pulley bolts/screws (246) and pulley (192), if equipped with mechanical fan.
4. Balancer bolts/screws (46) and balancer (42).
5. Match mark crankshaft hub (45) to engine front cover.
 - Do not crank engine over after match marking crankshaft hub and engine front cover. Rotating crankshaft will misalign installation of crankshaft hub and balancer-to-crankshaft,

possibly resulting in engine imbalance. If engine must be rotated, then alternative method of alignment is outlined during installation.

6. Crankshaft hub bolt/screw (43) and washer (44).
7. Crankshaft hub (45) using J 39046.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Crankshaft hub (45) using J 39046.

Important

- The crankshaft hub (45) can be installed by a different procedure if the engine should accidentally be cranked over after match marking the hub and engine front cover.
 - A. Set number 1 piston to top dead center. When number 1 piston is at top dead center, crankshaft keyway should be in position shown in Figure 22.
 - B. Install crankshaft hub (45) with cast arrow on hub in the 12 o'clock position.
- 2. Crankshaft hub washer (44) and bolt/screw (43).
 - If balancer is replaced, new balance weights of the same size must be installed on the new balancer in the same hole locations used on the old balancer.
- 3. Crankshaft balancer (42) and bolts/screws (46).

Tighten

- Crankshaft balancer hub bolt/screw (43) to 100 N.m (74 lb. ft.).
- Crankshaft balancer bolts/screws (46) to 85 N.m (63 lb. ft.).
- 4. Crankshaft pulley (192) and bolts/screws (246), if removed.

Tighten

- A. Crankshaft pulley bolts/screws (246) in clockwise pattern to 10 N.m (89 lb. in.).
- B. Tighten again in clockwise pattern to 25 N.m (18 lb. ft.).
5. Serpentine drive belt. Refer to "Serpentine Drive Belt and Tensioner" in this section.
6. Lower vehicle.

DISTRIBUTOR

The distributor is mounted to the engine front cover and pin driven by the camshaft. Refer to SECTION 6D4 for the distributor service procedures.

CRANKSHAFT POSITION SENSOR

Figure 17

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Electrical connector from sensor (86).
3. Bolt/screw (87).
4. Sensor (86) from engine front cover.

Inspect

- Seal and cover surface. Replace seal if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Sensor (86) to engine front cover.
2. Bolt/screw (87).

Tighten

- Bolt/screw to (87) 12 N.m (106 lb. in.).
3. Electrical connector to sensor (86).
 4. Lower vehicle.

Figure 17 - Crankshaft Position Sensor

ENGINE FRONT COVER

Figure 18

Tool Required:

- J 39087 Driven Gear Shaft Front Cover Seal Protector
- J 39937 Distributor Driveshaft Front Cover Seal Installer

Remove or Disconnect

1. Water pump. Refer to "Water Pump" in this section.
2. Crankshaft balancer and hub. Refer to "Crankshaft Balancer and Hub" in this section.
3. Distributor. Refer to SECTION 6D4.
4. Oil pan. Refer to "Oil Pan" in this section.
5. Engine front cover bolts/screws (52).
6. Engine front cover (50) and gasket (51).
7. Crankshaft position sensor from engine front cover if replacing cover. "Refer to Crankshaft Position Sensor" in this section.
8. Distributor driveshaft seal from engine front cover (50).
 - Pry out with flat-bladed tool.

Clean

- Engine front cover and engine block gasket surfaces.

Inspect

- Engine front cover (50) for damage to the seals or gasket surface. Refer to SECTION 6A4B to replace front cover seals if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

NOTICE: Be careful not to damage the seal when installing the engine front cover over the water pump driveshaft.

1. New distributor driveshaft seal to engine front cover (50) using J 39937.
2. Crankshaft position sensor to front cover if removed. Refer to "Crankshaft Position Sensor" in this section.
3. Gasket (51) and engine front cover (50) using J 39087 on water pump driveshaft.
4. Engine front cover bolts/screws (52).

Tighten

- Engine front cover bolts/screws (52) to 11 N.m (100 lb. in.).
5. Oil pan. Refer to "Oil Pan" in this section.
 6. Distributor. Refer to SECTION 6D4.

Figure 18 - Engine Front Cover

7. Crankshaft balancer and hub. Refer to "Crankshaft Balancer and Hub" in this section.

! Important

- Crankshaft balancer and hub must be oriented correctly on crankshaft or an engine vibration may result.
8. Water pump. Refer to "Water Pump" in this section.

TIMING CHAIN, CRANKSHAFT AND CAMSHAFT SPROCKETS, AND WATER PUMP DRIVESHAFT

Figures 18 through 22

Tools Required:

- J 5825-A Crankshaft Gear Remover
- J 5590 Crankshaft Gear Installer
- J 39243 Water Pump Drive Shaft Remover
- J 41546 Water Pump Drive Shaft Installer
- J 39087 Driven Gear Shaft Front Cover Seal Protector
- J 39089 Driven Gear/Water Pump Shaft Seal Installer

↔ Remove or Disconnect

1. Water pump. Refer to "Water Pump" in this section.
2. Engine front cover. Refer to "Engine Front Cover" in this section.

3. Reluctor ring (80) from crankshaft hub.

4. Rotate crankshaft until timing marks punched on crankshaft sprocket (62) and camshaft sprocket (57) are aligned as shown in Figure 20. Camshaft sprocket bolts/screws (56).

5. Camshaft sprocket (57) and timing chain (61).

NOTICE: Do not turn the crankshaft after the timing chain has been removed to prevent damage to pistons or valves.

6. Water pump bearing retainer bolts/screws (64) and water pump driveshaft (63) using J 39243.
 - Remove and discard seal from water pump driveshaft (63).
7. Crankshaft sprocket (62) using J 5825-A.
8. Key, if necessary.

🔍 Inspect

- Camshaft and crankshaft sprockets (57 and 62) and water pump driveshaft (63) for wear.
 - One edge of teeth worn or teeth no longer concentric.
 - Valley between teeth worn.
- Key and crankshaft keyway for wear.
- Timing chain (61) for binding.
- Timing chain (61) for signs of contacting engine front cover.

Figure 19 - Reluctor Ring

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Key, if previously removed.
2. Crankshaft sprocket (62) using J 5590.
3. Water pump driveshaft (63) using J 41546.
 - Place J 41546 over the water pump shaft with the three fingers of the tool passing through the gear. Use a mallet to drive the shaft into the block casting.
4. Water pump bearing retainer bolts/screws (64).

Tighten

- Water pump bearing retainer bolts/screws (64) to 12 N.m (106 lb. in.).
5. Camshaft sprocket (57) and timing chain (61).
 - Camshaft sprocket and water pump driveshaft gears must mesh, or damage to camshaft retainer (59) could occur.
 6. Camshaft sprocket bolts/screws (56).
 - Make sure that camshaft and crankshaft timing marks align as shown in Figure 20.

Tighten

- Camshaft sprocket bolts/screws (56) to 25 N.m (18 lb. ft.).
7. New seal to water pump driveshaft (63) using J 39089.

8. Reluctor ring (80) on crankshaft hub.
9. Engine front cover. Refer to "Engine Front Cover" in this section.
10. Water pump. Refer to "Water Pump" in this section.

CAMSHAFT

Figures 20 and 23 through 25

Tool Required:

J 7872 Magnetic Base Indicator Set

Remove or Disconnect

1. Recover R134a refrigerant. Refer to SECTION 1B.
2. Intake manifold. Refer to "Intake Manifold" in this section.
3. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
4. Bolt/screw (66) and oil pump driveshaft (65).
5. Water pump. Refer to "Water Pump" in this section.
6. Engine front cover. Refer to "Engine Front Cover" in this section.
7. Camshaft sprocket. Refer to "Timing Chain, Crankshaft and Camshaft Sprockets, and Water Pump Driveshaft" in this section.
8. Valve lifters. Refer to "Valve Lifters" in this section.
9. Radiator. Refer to SECTION 6B.
10. Air conditioning condenser. Refer to SECTION 1B.
11. Camshaft retainer bolts/screws (58) and camshaft retainer (59).

NOTICE: All camshaft journals are the same diameter so care must be used in removing the camshaft to avoid damage to the bearings.

12. Camshaft (60).
 - A. Install three 5/16-18 x 4-inch bolts/screws in camshaft bolt/screw holes (Figure 24).
 - B. Carefully rotate and pull camshaft (60) out of bearings.

Inspect

1. Camshaft journals with micrometer.
 - If journals are more than 0.025 mm (0.0010 inch) out-of-round, replace with new camshaft (60).
2. Camshaft runout using J 7872.
 - Mount camshaft (60) in V-blocks. Using J 7872, check intermediate camshaft journal. If runout exceeds 0.038mm (0.0015 inch), camshaft (60) is excessively bent and should be replaced.
3. Camshaft lobe lift with micrometer (Figure 25).

Figure 20 - Camshaft, Sprockets and Water Pump Driveshaft

**Measure**

- A. Camshaft lobe "high point."
- B. Camshaft lobe "low point."
- C. Subtract camshaft lobe "low point" from "high point" and compare to specifications under "Engine Specifications" at end of this section.
4. Camshaft bearings for scratches, pits, or loose fit in their bores. Replace the camshaft bearings, if necessary. Refer to SECTION 6A4B.

**Install or Connect**

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. When installing a new camshaft (60), coat camshaft lobes with "Molykote" or its equivalent.
2. When installing a new camshaft (60), replace all valve lifters to ensure durability of the camshaft lobes and lifter rollers.
3. Lubricate all camshaft journals with engine oil.
4. Camshaft (60).
5. Camshaft retainer (59) and camshaft retainer bolts/screws (58).

**Tighten**

- Camshaft retainer bolts/screws (58) to 12 N.m (106 lb. in.).
6. Air conditioning condenser. Refer to SECTION 1B.
 7. Radiator. Refer to SECTION 6B.
 8. Valve lifters. Refer to "Valve Lifters" in this section.
 9. Camshaft sprocket. Refer to "Timing Chain, Crankshaft and Camshaft Sprockets, and Water Pump Driveshaft" in this section.
 10. Engine front cover. Refer to "Engine Front Cover" in this section.
 11. Water pump. Refer to "Water Pump" in this section.
 12. Oil pump driveshaft (65) and bolt/screw (66).

Figure 21 - Crankshaft Sprocket Replacement

Tighten

- Bolt/screw (66) to 18 N·m (13 lb. ft.).
- 13. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
- 14. Intake manifold. Refer to "Intake Manifold" in this section.
- 15. Charge air conditioning system with R134a refrigerant. Refer to SECTION 1B.

VALVE SPRING AND STEM SEAL

Figures 26 and 27

Tools Required:

- J 23590 Spark Plug Port Adapter
- J 5892-D Valve Spring Compressor (Head-On)

This procedure is for servicing valve springs and valve stem seals if cylinder head is not being removed. If cylinder head is also being removed, refer to SECTION 6A4B.

Figure 22 - Installing Water-Pump Driveshaft

Figure 23 - Oil Pump Driveshaft

Remove or Disconnect

1. Valve rocker arms and pushrods at cylinder to be serviced. Refer to "Valve Rocker Arms and Pushrods" in this section.
2. Spark plug at cylinder to be serviced.
3. Install J 23590 to spark plug hole and apply compressed air to hold valves in place.
4. Compress valve spring (69) using J 5892-D (Figure 26).
5. Valve stem keys (72).

Figure 24 - Removing Camshaft

6. Valve spring cap (70).
7. Valve spring (69).
8. Valve stem oil seal (73).

Install or Connect

1. Valve stem oil seal (73) and seat seal against valve spring shim (76).
2. Valve spring (69).
3. Valve spring cap (70).
4. Compress valve spring (69) using J 5892-D.
5. Valve stem keys (72).
 - A. Use grease to hold keys (72) in place while disconnecting J 5892-D.
 - B. Remove J 23590.
 - C. Make sure keys (72) seat properly in upper groove of valve stem.
 - D. Tap end of stem with plastic-faced hammer to seat keys (72), if necessary.
6. Spark plug.

Tighten

- Spark plug to 30 N.m (22 lb. ft.) with new head installation.
 - Spark plug to 20 N.m (15 lb. ft.) for all subsequent installations.
7. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.

Figure 25 - Measuring Camshaft Lobe Lift

Figure 26 - Compressing Valve Spring

CYLINDER HEAD AND GASKET

Figure 28

Left Cylinder Head

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Drain coolant. Refer to SECTION 6B.
3. Warm up three-way catalytic converter and gasket from exhaust manifold. Refer to SECTION 6F.
4. Lower vehicle.
5. Intake manifold. Refer to "Intake Manifold" in this section.
6. Secondary air injection hose from check valve.

Figure 27 - Valve (Intake Shown, Exhaust Similar)

7. Coolant air bleed pipe bolt/screw from left cylinder head using a backup wrench on pipe fitting.
8. Ignition coil bolts/screws and coil. Refer to SECTION 6D4.
9. Left exhaust manifold. Refer to "Exhaust Manifolds" in this section.
10. Spark plug wire harness from clips.

11. Spark plug wire harness from spark plugs.
12. Spark plugs.
13. Coolant temperature sensor connector.
14. Rocker arm cover bolts/screws and cover. Refer to "Valve Rocker Arm Covers" in this section.
15. Rocker arm nuts, rocker arms, and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
16. Cylinder head bolts/screws (81).
17. Cylinder head (34) and cylinder head gasket (82).
 - Discard cylinder head gasket (82).

Important

- Refer to SECTION 6A4B for cylinder head cleaning, inspection and repair.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. New cylinder head gasket (82) with yellow tab facing up.
2. Cylinder head (34) over locator pins and cylinder head gasket (82).
3. Coat threads of cylinder head bolts/screws (81) with sealing compound, GM P/N 1052080 or equivalent.
4. Cylinder head bolts/screws (81).

Tighten

- Cylinder-head bolts/screws (81) in sequence on first pass to 30 N.m (22 lb. ft.) (Figure 28).

Figure 28 - Cylinder Head

- Cylinder-head bolts/screws (81) in sequence on second pass using J 36660 to:
 - Short bolts (3,4,7,8,11,12,15, & 16) additional 55 degrees.
 - Medium bolts (14 & 17) additional 65 degrees.
 - Long bolts (1,2,5,6,9,10 & 13) additional 75 degrees.
- 5. Pushrods and valve rocker arms. Refer to "Valve Rocker Arms and Pushrods" in this section.
- 6. Right valve rocker arm cover and bolts/screws.

Tighten

- Valve rocker arm cover bolts/screws to 12 N.m (106 lb. in.).
- 7. Coolant temperature sensor connector.
- 8. Spark plugs.

Tighten

- Spark plugs to 30 N.m (22 lb. ft.) with cylinder head replacement.
- Spark plugs to 20 N.m (15 lb. ft.) with existing cylinder heads.
- 9. Spark plug wire harness to spark plugs.
- 10. Spark plug wire harness to clips.
- 11. Left exhaust manifold. Refer to "Exhaust Manifolds" in this section.
- 12. Ignition coil bolts/screws and coil.

Tighten

- Ignition coil bolts/screws to 40 N.m (30 lb. ft.).
- 13. Engine coolant air bleed pipe and bolt/screw to left cylinder head using a backup wrench on pipe fitting.

Tighten

- Engine coolant air bleed pipe bolt/screw to 40 N.m (30 lb. ft.).
- 14. Secondary air injection hose to check valve.
- 15. Intake manifold. Refer to "Intake Manifold" in this section.
- 16. Raise and suitably support vehicle. Refer to SECTION 0A.
- 17. Warm up three-way catalytic converter and gasket to exhaust manifold. Refer to SECTION 6F.
- 18. Lower vehicle.
- 19. Refill with coolant and bleed system. Refer to SECTION 6B.

Right Cylinder Head

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Drain coolant. Refer to SECTION 6B.

3. Serpentine drive belt and belt tensioner. Refer to "Serpentine Drive Belt and Tensioner" in this section.
4. Transmission fluid level indicator tube bracket from transmission housing and rear of right cylinder head (34).
5. Air conditioning compressor rear brace bolt/screw from engine block.
6. Air conditioning compressor electrical connector.
7. Air conditioning compressor front mounting bolts/screws and lay air conditioning compressor aside.
8. Warm up three-way catalytic converter and gasket from exhaust manifold. Refer to SECTION 6F.
9. Lower vehicle.
10. Right exhaust manifold. Refer to "Exhaust Manifolds" in this section.
11. Generator. Refer to SECTION 6D3.
12. Right valve rocker arm cover. Refer to "Valve Rocker Arm Covers" in this section.
13. Intake manifold. Refer to "Intake Manifold" in this section.
14. Coolant air bleed pipe bolt/screw from both cylinder heads.
15. Radiator outlet hose from water pump and reposition.
16. Heater hoses from water pump and reposition.
17. Power steering pump. Refer to SECTION 3B.
18. Generator and air conditioning compressor and power steering pump bracket. Refer to SECTION 6D3.
19. Spark plug wire harness from spark plugs.
20. Spark plugs.
21. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
22. Engine coolant temperature sensor electrical connector on side of cylinder head.
23. Cylinder head bolts/screws (81).
24. Cylinder head (34) and gasket (82).
 - Discard gasket (82).

Important

- Refer to SECTION 6A4B for cylinder head cleaning, inspection and repair.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. New cylinder head gasket (82) with yellow tab facing up.
2. Cylinder head (34) over dowel pins and gasket (82).
3. Coat threads of cylinder head bolts/screws (81) with sealing compound, GM P/N 1052080 or equivalent.
4. Cylinder head bolts/screws (81).

**Tighten**

- Cylinder-head bolts/screws (81) in sequence on first pass to 30 N·m (22 lb. ft.) (Figure 28).
- Cylinder-head bolts/screws (81) in sequence on second pass using J 36660 to:
 - Short bolts (3,4,7,8,11,12,15, & 16) additional 55 degrees.
 - Medium bolts (14 & 17) additional 65 degrees.
 - Long bolts (1,2,5,6,9,10 & 13) additional 75 degrees.
- 5. Engine coolant temperature sensor electrical connector on side of cylinder head.
- 6. Valve rocker arms and pushrods. Refer to "Valve Rocker Arms and Pushrods" in this section.
- 7. Spark plugs.

**Tighten**

- Spark plugs to 30 N·m (22 lb. ft.) with cylinder head replacement.
 - Spark plugs to 20 N·m (15 lb. ft.) with existing cylinder heads.
8. Spark plug wire harness to spark plugs.
 9. Generator and air conditioning compressor and power steering pump bracket and generator bracket bolts/screws.

**Tighten**

- Generator bracket bolts/screws to 40 N·m (30 lb. ft.).
10. Power steering pump. Refer to SECTION 3B.
 11. Right valve rocker arm cover. Refer to "Valve Rocker Arm Covers" in this section.
 12. Generator. Refer to SECTION 6D3.
 13. Heater hoses to water pump.
 14. Radiator outlet hose to water pump.
 15. Coolant air bleed pipe bolt/screws to both cylinder heads using backup wrench.

**Tighten**

- Engine coolant air bleed pipe bolts/screws to 40 N·m (30 lb. ft.).
16. Intake manifold. Refer to "Intake Manifold" in this section.
 17. Right exhaust manifold. Refer to "Exhaust Manifolds" in this section.
 18. Raise and suitably support vehicle. Refer to SECTION 0A.
 19. Warm up three-way catalytic converter and gasket to exhaust manifold. Refer to SECTION 6F.
 20. Air conditioning compressor front mounting bolts/screws.

**Tighten**

- Air conditioning compressor front mounting bolts/screws to 50 N·m (37 lb. ft.).

21. Air conditioning compressor electrical connector.
22. Air conditioning compressor rear brace bolt/screw to engine block.

**Tighten**

- Air conditioning compressor rear brace bolt/screw to 25 N·m (18 lb. ft.).
23. Transmission fluid level indicator tube bracket to transmission housing and rear of right cylinder head (34).
 24. Serpentine drive belt and belt tensioner. Refer to "Serpentine Drive Belt and Tensioner" in this section.
 25. Lower vehicle.
 26. Refill with coolant and bleed system. Refer to SECTION 6B.

SPARK PLUG INSTALLATION**Figure 29**

Beginning with 1996 Caprices and Roadmasters, the correct spark plug (AC 41-943) tightening specifications are as follows:

- Spark plugs to 30 N·m (22 ft. lb.) with new cylinder head installation.
- Spark plugs to 22 N·m (15 ft. lb.) with existing engine assembly.

ENGINE OIL FILTER ADAPTER AND HOSE**Figure 30****Remove or Disconnect**

1. Engine oil cooler hose upper fitting at radiator.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Engine oil cooler hose lower fitting at radiator .
 - Place drain pan under radiator to catch oil.
4. Heated oxygen sensor electrical connector.

**Figure 29 - Spark Plug Identification**

4.3L & 5.7L V8 ENGINE ON-VEHICLE SERVICE RPO L99 - VIN W & LT1 - VIN P 6A4A-25

5. Engine oil cooler pipe clip nut (251) and hose nut (252).
6. Engine oil cooler hose (250).
 - Discard seals.
7. Engine oil filter (144).
8. Oil filter adapter bolt/screw (143) and washer (145).
9. Oil filter adapter (142), seal (141) and gasket (140).

Clean

- Any oil from exhaust components.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Oil filter adapter gasket (140), seal (141) and adapter (142).
2. Oil filter adapter washers (145) and bolts/screws (143).

Tighten

- Bolts/screws (143) to 25 N·m (18 lb. ft.).
3. Engine oil filter (144).
 - Hand tighten.

4. Engine oil cooler hose (250) with new seals.
5. Engine oil cooler pipe clip nut (251) and hose nut (252).

Tighten

- Nut (251) to 6 N·m (53 lb. in.).
- Nut (252) to 35 N·m (26 lb. ft.).
- 6. Heated oxygen sensor electrical connector.
 - Route sensor pigtail through engine oil cooler hose pipes.
- 7. Engine oil cooler hose lower fitting at radiator.

Tighten

- Lower fitting to 24 N·m (18 lb. ft.).
- 8. Lower vehicle.
- 9. Engine oil cooler hose upper fitting at radiator.

Tighten

- Upper fitting to 24 N·m (18 lb. ft.).

Inspect

- Engine oil level before and after running vehicle. If engine oil was also replaced, reset engine oil life monitor whether lamp came on or not. Refer to SECTION 0B.

GM

Restoration
Parts

Figure 30 - Oil Filter Adapter and Hose

Figure 31 - Oil Pan Sealer

OIL PAN

Figures 4, 15, 31 and 32

Remove or Disconnect

CAUTION: Refer to "Caution" on page 6A4A-1 of this section.

1. Battery negative cable.
2. Air cleaner resonator bracket nuts (243).
3. Air cleaner resonator (244).
 - Loosen clamp (242) and slide resonator off studs (241).
4. Air intake duct.
5. Radiator fan upper shroud, if equipped with mechanical fan. Refer to SECTION 6B.
6. Windshield wiper motor electrical connector.
7. Raise and suitably support vehicle. Refer to SECTION 0A.
8. Drain engine oil.
9. Oil level sensor connector.
10. Oil level sensor (178).
11. Warm up three-way catalytic converters from exhaust manifolds. Refer to SECTION 6F.
12. Catalytic converter support-to-transmission bolts/screws and washers.
13. Engine oil filter adapter. Refer to "Engine Oil Filter Adapter and Hose" in this section.
14. Transmission fluid cooler lines from clip at oil pan.
15. Starter motor. Refer to SECTION 6D2.
16. Converter cover bolts/screws and cover.
17. Rotate crankshaft until arrow on crankshaft balancer is pointing straight down (six o'clock position). Refer to Figure 15.

18. Engine mount through-bolts/screws and nuts.
19. Raise engine with jacking fixture.
20. Oil pan bolts/screws (84), studs (83) and nuts (85).
21. Oil pan (54), reinforcements (53) and gasket (55).

Clean

- Oil pan and engine block gasket surfaces.
- Apply a small amount of sealer, GM P/N 1052914 or equivalent, to the front cover and engine block junction and to the rear oil seal housing and engine block junction. Apply sealer 25 mm (1 inch) in either direction of the radius cavity of these junctions. Refer to Figure 31.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Oil pan gasket (55), oil pan (54) and reinforcements (53).
2. Oil pan nuts (85), bolts/screws (84) and studs (83).

Tighten

- Corner oil pan bolts/screws (84) or stud (83), and nuts (85) to 20 N.m (15 lb. ft.).
 - Remainder of oil pan bolts/screws (84) and studs (83) to 12 N.m (106 lb. in.).
3. Lower engine.
 4. Engine mount through-bolts/screws and nuts.

Tighten

- Engine mount through-bolts/screws to 120 N.m (89 lb. ft.) or nuts to 80 N.m (59 lb. ft.).
- Oil level sensor (178).

Tighten

- Engine oil level sensor (178) to 35 N.m (26 lb. ft.).
- Converter cover and bolts/screws.
 - Starter motor. Refer to SECTION 6D2.
 - Transmission fluid cooler lines to clip at oil pan (54).
 - Engine oil filter adapter. Refer to "Engine Oil Filter Adapter and Hose" in this section.
 - Catalytic converter support-to-transmission bolts/screws and washers.

Tighten

- Catalytic converter support-to-transmission bolts/screws to 34 N.m + 55° (26 lb. ft. + 55°).
- Warm up three-way catalytic converters to exhaust manifolds. Refer to SECTION 6F.
 - Oil level sensor connector.
 - Lower vehicle.
 - Windshield wiper motor electrical connector.
 - Radiator fan upper shroud, if removed. Refer to SECTION 6B.
 - Air intake duct.
 - Air cleaner resonator (244).
 - Slide resonator onto studs (241) and tighten clamp (242) snugly.
 - Air cleaner resonator bracket nuts (243).

Tighten

- Nuts (243) to 10 N.m (89 lb. in.).
- Battery negative cable.
 - Refill engine with oil.
 - Refill with coolant. Refer to SECTION 6B.
 - If engine oil was also replaced, reset engine oil life monitor whether lamp came on or not. Refer to SECTION 0B.

OIL PUMP

Figure 33

Remove or Disconnect

- Oil pan. Refer to "Oil Pan" in this section.
- Oil pan baffle nuts.
- Bolt/screw (120) attaching oil pump (118) to rear crankshaft bearing cap.
- Oil pan baffle (119), oil pump (118), driveshaft (89) and retainer (95).

Important

- Refer to SECTION 6A4B for oil pump cleaning, inspection and repair.

Figure 32 - Oil Pan

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Oil pump (118), and driveshaft (89) with retainer (95).
 - Align slot on end of driveshaft (89) with drive tang on oil pump (118).
2. Oil pan baffle (119).
3. Bolt/screw (120) attaching oil pump (118) to rear crankshaft bearing cap.
4. Oil pan baffle nuts.

Tighten

- Bolt/screw (120) to 90 N.m (66 lb. ft.).
 - Oil pan baffle nuts to 40 N.m (30 lb. ft.).
5. Oil pan. Refer to "Oil Pan" in this section.

Figure 33 - Oil Pump

CONNECTING ROD BEARINGS

Figure 34

Connecting rod bearings are the precision insert type and do not use shims for adjustment. Do not file connecting rods or rod caps. If clearances are found to be excessive, a new bearing will be required. Service bearings are available in standard size and 0.001 and 0.002-inch undersize for use with new and used standard size crankshafts, and in 0.010 and 0.020-inch undersize for use with reconditioned crankshafts.

When removing a connecting rod cap, you may find a 0.010-inch undersize bearing. These are used in manufacturing for selective fitting.

Remove or Disconnect

1. Oil pan. Refer to "Oil Pan" in this section.
2. Oil pump. Refer to "Oil Pump" in this section.

Important

- Place match marks or numbers on connecting rods (104) and connecting rod caps (99). Connecting rod caps (99) must be assembled to their original connecting rods (104).
3. Connecting rod nuts (100).
 4. Connecting rod cap (99) and bearings (101).
 - Keep bearings (101) with their original connecting rods (104) and connecting rod cap (99) for reassembly.
 - Wipe oil from bearings (101) and crankpins.

Inspect

- Bearings (101) for excessive wear or damage.

Measure

1. Crankpin for out-of-round and taper with a micrometer. Compare measurements to "Engine Specifications" in this section.
 - If not within specifications, replace or recondition crankshaft (98).
 - If installing new bearings (101), determine new bearing size from maximum crankpin diameter.
2. Bearing clearances, using gaging plastic.
 - A. Place piece of gaging plastic the full width of bearing (101), (parallel to crankshaft (98)) onto crankpin.
 - Plastic gage should be positioned in middle of bearing (101). Bearing (101) is thickest in center and bearing clearance must be measured at this location.
 - B. Install connecting rod cap (99) with bearing (101) onto connecting rod (104).
 - Connecting rods (104) and connecting rod caps (99) have bearing locating notches to prevent bearings (101) from moving. These notches must face each other.
 - C. Install connecting rod nuts (100).

**Tighten**

- Connecting rod nuts (100), evenly, to 27 N.m + 55° (20 lb. ft. + 55°).

NOTICE: Do not turn the crankshaft with the gaging plastic installed or the accuracy of the measurement will be affected.

D. Remove connecting rod nuts (100) and connecting rod cap (99). The gaging plastic will be found adhering to either the connecting rod cap (99) or crankshaft journal. Leave the gaging plastic in place to measure it.

E. Measure gaging plastic at its widest, using scale provided with gaging plastic. Compare measurements to "Engine Specifications" in this section.

- If clearance is greater than specified, select an undersize bearing (101) and re-measure clearance.
- If clearance cannot be brought to specifications, regrind crankpin. If crankpin is already at maximum undersize, replace crankshaft (98).

F. Remove gaging plastic.

**Install or Connect**

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Coat inside surface of bearings (101) with engine oil.
2. Connecting rod cap (99) and bearings (101).
3. Connecting rod nuts (100).

**Tighten**

- Connecting rod nuts (100), evenly, to 27 N.m + 55° (20 lb. ft. + 55°).

**Measure**

- Connecting rod side clearance.
 - A. When all connecting rod bearings (101) have been installed, tap each connecting rod (104) lightly parallel to crankpin to make sure they have clearance.
 - B. Measure side clearance between connecting rod caps (99) using a feeler gage, or dial indicator.
 - C. Rod side clearance should be 0.16 to 0.35 mm (0.006 to 0.014 inch).
- 4. Oil pump. Refer to "Oil Pump" in this section.
- 5. Oil pan. Refer to "Oil Pan" in this section.

Figure 34 - Piston and Connecting Rods

PISTONS AND CONNECTING RODS**Figure 34****Tools Required:**

J 8037 Piston Ring Compressor

J 5239 Connecting Rod Bolt Guide Set

**Remove or Disconnect**

1. Oil pan. Refer to "Oil Pan" in this section.
2. Oil pump. Refer to "Oil Pump" in this section.
3. Cylinder head. Refer to "Cylinder Head and Gasket" in this section.
4. Ring ridge.
 - A. Turn crankshaft (98) until piston (103) is at bottom of its stroke.
 - B. Place a cloth on top of piston (103).
 - C. Use a ridge reamer to remove ring ridge.
 - D. Turn crankshaft (98) so piston (103) is at top of its stroke.
 - E. Remove cloth and cutting debris.

**Important**

- Place match marks or numbers on connecting rods (104) and connecting rod caps (99). Connecting rod caps (99) must be assembled to their original connecting rods (104).
5. Connecting rod nuts (100) and connecting rod cap (99).
 6. Connecting rod (104) and piston (103) out of top of engine block using J 5239.

**Important**

- Refer to SECTION 6A4B for cleaning, inspection and repair of the piston and connecting rod.

**Clean**

1. Cylinder bores with hot water and detergent or with a light honing.
2. Swab bores with engine oil and a clean, dry cloth.

**Install or Connect**

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Coat piston (103), piston rings, cylinder bore, and bearing surfaces with engine oil.
2. Piston (103) into its original bore using J 5239 and J 8037 and lightly tapping top of piston (103) with a wooden hammer handle.
 - A. When installing piston (103) and connecting rod (104), stamped arrow on piston (103) must point to front of engine while flange on connecting rod (104) must face toward front of piston on left-hand side and face toward rear of piston on right-hand side. Refer to Figure 34.

B. Hold J 8037 firmly against engine block until all piston rings have entered cylinder bore.

3. Connecting rod caps (99) onto their original connecting rods (104).
 - Align match marks or numbers which were placed on connecting rod (104) and connecting rod cap (99) during removal.
 - Connecting rods (104) and connecting rod caps (99) have bearing locating notches to prevent bearings (101) from moving. These notches must face each other.
4. Connecting rod nuts (100).

**Tighten**

- Connecting rod nuts (100), evenly, to 27 N.m + 55° (20 lb. ft. + 55°).
5. Cylinder head. Refer to "Cylinder Head and Gasket" in this section.
 6. Oil pump. Refer to "Oil Pump" in this section.
 7. Oil pan. Refer to "Oil Pan" in this section.

CRANKSHAFT BEARINGS**Figures 31 and 32****Tool Required:**

J 8080 Main Bearing Shell Remover and Installer

Crankshaft bearings are of the precision insert type. If clearances are found to be excessive, a new bearing, both upper and lower halves, will be required. Service bearings are available in both standard size and undersize. Selective fitting of both connecting rod and crankshaft bearing inserts is necessary in production in order to obtain close tolerances. For example, on a rear crankshaft bearing you may find one half of a standard insert with one half of a 0.001 inch undersize insert which will decrease the clearance 0.0005 inch from using a full standard bearing.

**Important**

- If replacing the rear crankshaft bearing, check for the correct part number. Some rear crankshaft bearings are 0.20 mm (0.008 inch) wider than standard. The crankshaft will be identified by "0.008" stamped on the rear counterweight.

**Remove or Disconnect**

1. Oil pan. Refer to "Oil Pan" in this section.
2. Oil pump. Refer to "Oil Pump" in this section.
3. Spark plugs.
4. Cap (107 or 109) and lower bearing of crankshaft bearing (110 or 111) requiring replacement.
5. Insert J 8080 into oil hole in crankshaft journal.
6. Rotate crankshaft (98) allowing J 8080 to push against crankshaft bearing's straight (unnotched) side. This will roll upper bearing out of block.

Figure 35 - Crankshaft

7. Remove J 8080 from crankshaft (98).

Inspect

- In general, the lower half of the crankshaft bearing (except # 1 bearing) shows a greater wear and the most distress from fatigue. If upon inspection the lower half is suitable for use, it can be assumed that the upper half is also satisfactory. If the lower half shows evidence of wear or damage, both upper and lower halves should be replaced. Never replace one half without replacing the other half.

Important

- To obtain the most accurate results when checking crankshaft bearing clearances, use gaging plastic.
- If the engine is out of the vehicle and upside down, the crankshaft will rest on the upper bearings and the total clearance can be measured between the lower bearing and

Figure 36 - Removing Crankshaft Bearing

journal. If the engine is to remain in the vehicle, the crankshaft must be supported upward to remove any clearance from the upper bearing. The total clearance can then be measured between the lower bearing and journal. To assure the proper seating of the crankshaft, all bearing cap bolts/screws should be at their specified torque. In addition, prior to checking fit of bearings, the surface of the crankshaft journal and bearing should be wiped clean of oil.

Measure

1. With oil pan and oil pumps removed, and starting with rear crankshaft bearing, remove bearing cap and wipe oil from journal and bearing cap. Note location of studs and bolts/screws.
2. Place a piece of gaging plastic the full width of bearing (parallel to the crankshaft) on journal.

Important

- Do not rotate the crankshaft while the gaging plastic is between the bearing and journal.

3. Install bearing cap and evenly tighten bearing cap bolts/screws to specifications. Bearing cap must be tightened to specification in order to assure proper reading. Variations in torque affect the compression of the gaging plastic.

Tighten

- Crankshaft bearing cap bolts/screws (108) and studs to 105 N.m (77 lb. ft.).
4. Remove bearing caps. The flattened gaging plastic will be found adhering to either the bearing shell or journal.
 5. Without removing gaging plastic, measure its compressed width (at the widest point) with graduations on gaging plastic envelope. Normally crankshaft bearing journals wear evenly and are not out-of-round. However, if a bearing is being fitted to an out-of-round journal (0.001 inch maximum), be sure to fit to maximum diameter of journal: If bearing is fitted to minimum diameter, and journal is out-of-round 0.001 inch, interference between bearing and journal will result in rapid bearing failure. If flattened gaging plastic tapers toward middle or ends, there is a difference in clearance indicating taper, low spot or other irregularity of bearing or journal. Be sure to measure journal with a micrometer if flattened gaging plastic indicates more than 0.001 inch difference.
 6. If bearing clearance is within specifications, bearing insert is satisfactory. If clearance is not within specifications, replace insert. Always replace both upper and lower inserts as a unit. When bearing cap is installed and clearance is less than 0.001 inch, inspect for burrs or nicks.

7. A standard, 0.001 inch or 0.002 inch undersize bearing may produce proper clearance. If not, it will be necessary to regrind crankshaft journal for use with next undersize bearing. After selecting new bearing, recheck clearance.

8. Proceed to next bearing. When checking number 1 crankshaft bearing, loosen accessory drive belt so as to prevent tapered reading with gaging plastic. After all bearings have been checked, rotate crankshaft to see that there is no excessive drag.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Crankshaft bearings (110 and 111) into engine block (67) and crankshaft bearing caps (107) and rear crankshaft bearing cap (109).
 - A. Coat crankshaft bearings (110 and 111) with oil.
 - B. Insert straight (unnotched) end of crankshaft bearing between crankshaft (98) and notched side of block (67). Rotate bearing into place using J 8080 as previously described, and remove J 8080 from oil hole in crankshaft journal.
2. Crankshaft bearing caps (107) and rear crankshaft bearing cap (109) with assembled crankshaft bearings (110 and 111) with arrows pointing toward front of engine.
3. Crankshaft bearing cap bolts/screws (108) and studs (117).
 - With crankshaft (98), crankshaft bearings (110 and 111) and crankshaft bearing caps (107) and rear crankshaft bearing cap (109) installed and bolts/screws (108) and studs (117) started, thrust crankshaft (98) rearward to set and align bearing caps (107 and 109). Then thrust crankshaft (98) forward to align rear faces of rear crankshaft bearings (111).

Tighten

- Crankshaft bearing cap bolts/screws (108) and studs (117) to 105 N.m (77 lb. ft.).

Measure

- Crankshaft end play, using a dial indicator or feeler gage. Compare to "Engine Specifications" in this section.
- If using a feeler gage, measure between the front of the rear crankshaft bearing cap (109) and the crankshaft thrust surface.

Figure 37 - Flywheel

FLYWHEEL

Figure 37

Remove or Disconnect

1. Transmission. Refer to SECTION 7A.
2. Flywheel bolts/screws (138) and flywheel (137).

Figure 38 - Removing Crankshaft Rear Oil Seal

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

1. Flywheel (137) and flywheel bolts/screws (138).

Tighten

- Flywheel bolts/screws (138) to 100 N.m (74 lb. ft.).
2. Transmission. Refer to SECTION 7A.

CRANKSHAFT REAR OIL SEAL

Figures 35, 38 and 39

Remove or Disconnect

Tool Required:

J 35621 Rear Main Seal Installer

1. Flywheel. Refer to "Flywheel" in this section.

Important

- Care should be taken not to nick crankshaft sealing surface when removing seal.
2. Crankshaft rear oil seal.
 - Using notches provided in crankshaft rear oil seal housing (114), pry out seal with a screwdriver.

Install or Connect

1. Coat new seal entirely with engine oil.
2. Seal assembly onto J 35621.
3. J 35621 onto rear of crankshaft (98). Tighten screws snugly to ensure seal will be installed squarely over crankshaft (98).
4. Crankshaft rear oil seal to crankshaft (98) and crankshaft rear oil seal housing (114).
5. Tighten wing nut on J 35621 until it bottoms.

Figure 39 - Installing Crankshaft Rear Oil Seal

6. Remove J 35621 from crankshaft rear oil seal housing (114).
7. Flywheel. Refer to "Flywheel Replacement" under "Flywheel" in this section.

CRANKSHAFT REAR OIL SEAL HOUSING AND GASKET

Figures 35, 38 and 39

Remove or Disconnect

1. Flywheel. Refer to "Flywheel Replacement" in this section.
2. Oil pan. Refer to "Oil Pan" in this section.
3. Crankshaft rear oil seal housing nuts (115) and bolts/screws (116).
4. Crankshaft rear oil seal housing (114) with assembled seal, and gasket (113).
5. Crankshaft rear oil seal from crankshaft rear oil seal housing (114).

Clean

- Gasket surfaces.

Install or Connect

NOTICE: Refer to "Notice" on page 6A4A-1 of this section.

Important

- Always use a new crankshaft rear oil seal and a new oil seal housing gasket (113) during the installation of the crankshaft rear oil seal housing (114).
1. New oil seal housing gasket (113) and crankshaft rear oil seal housing (114) on studs (112).
 - It is not necessary to use any type of sealant to hold oil seal housing gasket (113) in place.
 2. Crankshaft rear oil seal housing nuts (115) and bolts/screws (116).

Tighten

- Crankshaft rear oil seal housing nuts (115) and bolts/screws (116) to 15 N.m (11 lb. ft.).

Inspect

- Oil pan gasket for damage. Replace gasket if necessary.
3. Oil pan. Refer to "Oil Pan" in this section.
 4. New crankshaft rear oil seal. Refer to "Crankshaft Rear Oil Seal" in this section.
 5. Flywheel. Refer to "Flywheel" in this section.

ENGINE

Important

- This vehicle uses a sequential multiport fuel injected engine. Fuel injector connectors must be positioned onto their appropriate fuel injector or engine performance and exhaust emissions may be seriously affected. Fuel injector connectors are numbered to match their correct fuel injector for that cylinder. If fuel injector connector numbers can not be identified, refer to SECTION 8A-20 for correct fuel injector connector wire color to fuel injector for each cylinder.

Remove or Disconnect

1. Battery negative cable.
2. Recover R134a refrigerant. Refer to SECTION 1B.
3. Drain coolant. Refer to SECTION 6B.
4. Air cleaner resonator bracket nuts.
5. Air cleaner resonator.
 - Loosen clamp at air intake duct and slide resonator off studs.
6. Air intake duct.
7. Fuel lines at fuel rail. Refer to SECTION 6C.
8. Radiator fan upper shroud, if equipped with mechanical fan. Refer to SECTION 6B.
9. Fan blade clutch nuts and fan blade with clutch attached, if equipped with mechanical fan.
10. Fan pulley, if equipped with mechanical fan.
11. Heater hose at water pump and bracket. Refer to "Water Pump" in this section.
12. Accelerator control cable at throttle body.
13. Radiator inlet and outlet hoses from water pump and engine.
14. Coolant hose at throttle body.
15. Raise and suitably support vehicle. Refer to SECTION 0A.
16. Engine oil filter adapter hoses, if equipped. Refer to "Engine Oil Filter Adapter and Hoses" in this section.
17. Drain engine oil.
18. Warm up three-way catalytic converters and gaskets from exhaust manifolds. Refer to SECTION 6F.
19. Converter cover bolts/screws and converter cover. Refer to SECTION 7A.
20. Converter bolts/screws. Refer to SECTION 7A.
21. Serpentine drive belt. Refer to "Serpentine Drive Belt and Tensioner" in this section.
22. Air conditioning compressor and condenser hose from compressor. Refer to SECTION 1B.
 - Plug open ends of lines and fittings.
23. Transmission fluid cooler lines from engine clips.
24. Radiator fan lower shroud, if equipped with mechanical fan. Refer to SECTION 6B.
25. Electric engine cooling fans. Refer to SECTION 6B.

26. Electrical connections from starter motor.
27. Electrical connectors from knock sensor and oxygen sensors.
28. Electrical connectors from engine oil level switch and fuel pump switch/engine oil pressure gage sensors.
29. Lower vehicle.
30. Power steering inlet and outlet hoses at pump.
 - Siphon fluid from reservoir to prevent excessive spillage.
31. Brake booster vacuum hose.
32. Generator wiring from generator.
33. Engine wiring harness connectors and ground straps. Reposition wiring harness.
34. Raise and suitably support vehicle. Refer to SECTION 0A.
35. Transmission-to-engine bolts/screws.
36. Transmission filler tube bolt/screw at rear of right side cylinder head.
37. Engine mount through-bolts/screws. Refer to "Engine Mounts and Brackets" in this section.
38. Lower vehicle.
39. Engine wiring harness support at left front corner of intake manifold.
40. Engine from vehicle.
 - Install engine lifting device to boss at left front corner of intake manifold using a 3/8-16 NC standard thread bolt. Use bolt long enough to thread into the intake manifold at least 25 mm (1 inch). Install other end of lifting device to fourth bolt position on right side of intake manifold. Use a 3/8-16 NC bolt long enough to thread into the cylinder head at least 25 mm (1 inch).

Important

- Refer to SECTION 6A4B for engine block cleaning, inspection, and repair.

Install or Connect

1. Engine to vehicle.
2. Engine wiring harness support at left front corner of intake manifold.
3. Raise and suitably support vehicle. Refer to SECTION 0A.
4. Engine mount through-bolts/screws. Refer to "Engine Mounts and Brackets" in this section.
5. Transmission filler tube bolt/screw at rear of right side cylinder head.

Tighten

- Transmission filler tube bolts/screws to 25 N.m (18 lb. ft.).
6. Transmission-to-engine bolts/screws.

Tighten

- Transmission-to-engine bolts/screws to 47 N.m (35 lb. ft.).

7. Lower vehicle.
8. Engine wiring harness, connectors and ground straps.
 - Fuel injector connectors must be connected to their appropriate fuel injector. Refer to SECTION 8A-20.
9. Generator. Refer to SECTION 6D3.
10. Generator wiring to generator.
11. Brake booster vacuum hose.
12. Power steering inlet and outlet hoses at pump.
13. Raise and suitably support vehicle. Refer to SECTION 0A.
14. Electrical connectors to engine oil level switch and fuel pump switch/engine oil pressure gage sensor.
15. Electrical connectors to knock sensor and oxygen sensor.
16. Electrical connections to starter motor.
17. Electric engine cooling fans. Refer to SECTION 6B.
18. Radiator fan lower shroud, if removed. Refer to SECTION 6B.
19. Transmission fluid cooler lines to engine clips.
20. Air conditioning compressor and condenser hose to compressor. Refer to SECTION 1B.
 - Unplug open ends of lines and fittings.
21. Serpentine drive belt. Refer to "Serpentine Drive Belt and Tensioner" in this section.
22. Converter bolts/screws. Refer to SECTION 7A.
23. Converter cover and converter cover bolts/screws. Refer to SECTION 7A.
24. Warm up three-way catalytic converters and gaskets to exhaust manifolds. Refer to SECTION 6F.
25. Engine oil filter adapter hoses, if equipped. Refer to "Engine Oil Filter Adapter and Hoses" in this section.
26. Lower vehicle.
27. Coolant hose at throttle body.
28. Radiator inlet and outlet hoses to water pump and engine. Refer to SECTION 6B.
29. Accelerator control cable to throttle body.
30. Heater hose to water pump and bracket. Refer to "Water Pump" in this section.
31. Fan pulley, if removed.
32. Fan blade with clutch attached and clutch nuts, if removed.

Tighten

- Fan blade clutch nuts to 26 N.m (19 lb. ft.).
33. Radiator fan upper shroud, if removed. Refer to SECTION 6B.
 34. Fuel lines at fuel rail. Refer to SECTION 6C.
 35. Air intake duct.
 36. Air cleaner resonator.
 - Slide resonator over studs and tighten clamp snugly.
 37. Air cleaner resonator bracket nuts.

**Tighten**

- Air cleaner resonator bracket nuts to 10 N.m (89 lb. in.).
- 38. Battery negative cable.
- 39. Refill with engine oil.
- 40. Refill and bleed cooling system. Refer to SECTION 6B.
- 41. Refill and bleed power steering system. Refer to SECTION 3B.
- 42. Charge air conditioning system with R134a and leak check air conditioning hose fitting at compressor. Refer to SECTION 1B.
- 43. Reset engine oil life monitor (unless oil was not changed). Refer to SECTION 0B.

THREAD REPAIR**Figure 40**

Damaged threads may be reconditioned by drilling out, re-threading and installing a suitable thread insert. General purpose thread repair kits are available commercially.

CAUTION: Wear safety glasses to avoid eye damage.

1. Determine size, pitch and depth of damaged thread. If necessary, adjust stop collars on cutting tool and tap to required depth.

**Important**

- Refer to kit manufacturer's instructions regarding size of drill and tap to be used.
2. Drill out damaged thread. Clean out chips.
 3. Tap hole.
 - A. Lubricate tap with light engine oil.
 - B. Clean thread.

**Important**

- Avoid build-up of chips. Back out tap every few turns and remove chips.
4. Thread the thread insert onto mandrel of installer. Engage tang of insert onto end of mandrel.
 5. Lubricate insert with light engine oil (except when installing in aluminum) and install.

**Important**

- When correctly installed, insert should be flush to one turn below surface.
6. If tang of insert does not break off when backing out installer, break tang off with drift pin.

4.3 AND 5.7 LITER V8 ENGINE UNIT REPAIR RPO L99 - VIN W RPO LT1 - VIN P

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require replacement after removal. General Motors also will call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplement coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and tightening specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

CONSTRUCTION

Figures 1 through 4

Engine Block

The engine block is made of cast iron and has eight cylinders arranged in a "V" shape with four cylinders in each bank. It is a one piece casting with the cylinders encircled by coolant jackets.

Cylinder Heads

The cylinder heads are cast iron. Valve guides and hardened valve seats are integral. Spark plugs are located between the intake and exhaust ports.

Crankshaft

The crankshaft is made of cast nodular iron. It is supported by five crankshaft bearings that are retained by bearing caps which are machined with the block for proper alignment and clearances. The bearing caps are retained by two bolts each. The number five bearing at the rear of the engine assembly is the end thrust bearing. Four connecting rod journals (two rods per journal) are spaced 90 degrees apart. Pushed onto the front of the crankshaft is the crankshaft position sensor reluctor ring. The reluctor ring has four lugs used for crankshaft timing and is constructed of powdered metal. The reluctor ring has a slight interference fit onto the crankshaft and an internal keyway for correct positioning.

Piston and Connecting Rod Assemblies

The pistons are cast aluminum that use two compression rings and one oil control ring assembly. The piston is a low-friction, lightweight design with a flat top and barrel-shaped skirt. The piston pins are chromium steel. They have a floating fit in the piston and are retained by a press fit in the connecting rod assembly. The connecting rod assemblies are made out of forged powdered metal. They are machined with the rod cap installed for proper clearances and alignment.

Camshaft

A steel camshaft is supported by five bearings pressed into the engine block. The timing sprocket mounted to the front of the camshaft is driven by the crankshaft sprocket through a camshaft timing chain.

The camshaft sprocket also has spur gear teeth which drive a geared shaft assembly to operate the water pump.

A spiral gear machined into the camshaft near the rear journal drives a shaft assembly which operates the oil pump.

A pin on the camshaft mates with the distributor driveshaft. This provides net build timing, meaning the ignition timing does not have to be adjusted.

Valve Train

The valve train is a ball pivot type. Motion is transmitted from the camshaft through hydraulic roller valve lifter and tubular valve pushrods to the valve rocker arms. The valve rocker arm pivots on a ball to open the valve. The hydraulic valve lifters keep all parts of the valve train in constant contact.

The valve rocker arm ball is retained on the valve rocker arm stud with a locking nut. The valve rocker arm stud is pressed into the cylinder head.

Intake Manifold

The intake manifold is a one-piece cast aluminum unit. The intake manifold has exhaust gas recirculation and crankcase vent passages cast into it. Coolant crossover passages have been eliminated.

Exhaust Manifolds

The two cast-iron exhaust manifolds direct exhaust gases from the combustion chambers to the exhaust system. The exhaust manifolds each have a port for air injection system pipe fittings.

LUBRICATION

Figures 5 through 7

Engine lubrication is supplied by a gear-type oil pump. The oil pump is driven by an intermediate

shaft. The intermediate shaft is connected to a driveshaft assembly which is driven by the camshaft. The oil pump gears rotate and draw oil from the oil pan sump through an oil pump screen and pipe. The oil is pressurized as it passes through the oil pump and sent through engine block oil galleries.

Contained within the oil pump is a pressure relief valve that maintains oil pressure within a specified range.

Pressurized oil is directed to the oil filter where harmful contaminants are removed. A bypass valve is also incorporated into the oil filter. The bypass allows oil to bypass the filter and flow to the engine assembly if the filter becomes clogged.

The oil is then pumped to the main oil gallery which is drilled through the length of the engine block just above the camshaft. At the rear of the engine block, oil also flows into the right and left valve lifter oil galleries. From the main oil gallery, oil is pumped downward to the camshaft bearings, then to the crankshaft bearings. The crankshaft bearing upper inserts are grooved to align with oil passages drilled from the crankshaft bearing journal to the connecting rod journal. After lubricating the connecting rod bearings, the cylinder walls, rings and piston pins are lubricated by oil which is "slung" from the connecting rod bearing journals due to the rotation of the crankshaft. This oil then returns to the oil pan sump. Oil that has entered the left and right valve lifter oil galleries pressurizes the hydraulic valve lifters and is then pumped up through the valve pushrods to lubricate the valve rocker arms and valve stems.

Oil returning to the oil pan from the cylinder heads and the front camshaft bearing, lubricates the camshaft timing chain and crankshaft and camshaft sprockets.

DISASSEMBLY

When beginning the engine assembly unit repair, the belt tensioner, power steering pump, air injection pump, generator, A/C compressor, and generator and A/C compressor brackets should already be removed. For removal procedures, refer to the specific section in the service manual for each component.

5. Exhaust gas recirculation (EGR) and distributor vacuum harness and crankcase vent hoses.
6. EGR vacuum control solenoid and bracket.
7. Move wiring harness out of area.
8. Disconnect distributor wiring harness, if necessary.
9. EGR valve nuts, EGR valve, and gasket.
10. EGR valve pipe bolt (229), nut (14), pipe (12), and gasket (22).
11. Accelerator cable bracket bolts and bracket.
12. Manifold absolute pressure (MAP) sensor bolts and MAP sensor.
13. Throttle body bolts, throttle body, and gasket.
14. Intake manifold bolts and studs.
15. Intake manifold and gaskets.

EXHAUST MANIFOLDS

Figures 10 and 11

Right Exhaust Manifold

Remove or Disconnect

1. Right cylinder bank spark plug wire harness from spark plugs and supports.
2. Oil level indicator tube bolt.
3. Oil level indicator and tube.
4. Right exhaust manifold air injection pipe (15) and check valve (11).
5. Right exhaust manifold studs (20), bolts (21), and spacers (245).
6. Right heat shields, exhaust manifold (19), and gasket (18).

Left Exhaust Manifold

Remove or Disconnect

1. Left exhaust manifold secondary air injection pipe (15) and check valve (11).
2. Left cylinder bank spark plug wire harness from spark plugs and supports.
3. Left exhaust manifold bolts (21) and spacers (245).
4. Left heat shields, exhaust manifold, and gasket (17).

Figure 2 - Upper Engine Assembly - Legend

VALVE ROCKER ARM COVERS**Figure 12****Right Valve Rocker Arm Cover****Remove or Disconnect**

1. Right valve rocker arm cover bolts.
2. Right valve rocker arm cover and gasket.

Left Valve Rocker Arm Cover**Remove or Disconnect**

1. Left valve rocker arm cover bolts.
2. Left valve rocker arm cover and gasket.

VALVE ROCKER ARMS AND VALVE PUSHRODS**Figure 13 and 14****Remove or Disconnect**

1. Valve rocker arm nuts (2) and balls (1).
 2. Valve rocker arms (3) and valve pushrods (4).
- Place valve rocker arms (3), valve rocker arm balls (1), and valve pushrods (4) in a rack so that they can be reinstalled in same locations from which they were removed.

VALVE LIFTERS**Figures 15, 16, and 17****Tool Required:**

- J 3049-A Valve Lifter Removal (Plier Type)
- J 9290-01 Valve Lifter Removal (Slide Hammer Type)

This diagram is an exploded view of a 1984-1985 Honda Civic 1.6L engine and transmission assembly. It shows the following components and their callout numbers:

- Engine Block and Cylinder Head:** 160, 162, 161, 74, 191, 170, 171, 144, 142, 143, 165, 168, 172, 167, 68, 100, 99, 101, 102, 103, 104, 105, 106.
- Intake Manifold and Air Filter:** 154, 156, 158, 157, 159, 160, 162, 161, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200.
- Timing Belt and Pulleys:** 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200.
- Valvetrain and Camshaft:** 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200.
- Transmission and Drivetrain:** 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200.
- Other Components:** 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200.

Figure 4 - Lower Engine Assembly - Legend

SS9056A48

Figure 5 - Engine Assembly Lubrication - Left Side View

SECTION A-A

FS9066A3B

Figure 6 - Engine Assembly Lubrication - Front View

Figure 7 - Engine Assembly Lubrication - Rear Views

Figure 8 - Engine Flywheel

Remove or Disconnect

1. Valve lifter guide retainer bolts and valve lifter guide retainer.
2. Valve lifter guides and valve lifters.
 - Some valve lifters may be stuck in their bores because of gum or varnish deposits. These valve lifters can be removed using J 3049 or J 9290-01.

WATER PUMP

Figures 18 and 19

Remove or Disconnect

1. Mechanical fan pulley bracket nuts and bracket, if equipped.
2. Air injection pump bracket bolts and bracket.
3. Water pump bolts.

Important

- A. Keep ignition wires connected to distributor until the water pump (37) is removed.
- B. Make sure coolant is drained.
4. Water pump (37), coupling (39), and gaskets (38).

CRANKSHAFT BALANCER AND HUB

Figures 20 and 21

Tool Required:
J 39046 Crankshaft Hub Removal and Installation

Remove or Disconnect

1. Crankshaft balancer bolts and balancer.
2. Crankshaft balancer hub bolt and washer.
3. Crankshaft balancer hub using J 39046.

Figure 9 - Intake Manifold, Fuel Rail, Throttle Body, and Air Cleaner Resonator Bracket

Figure 10 - Secondary AIR Injection and EGR Pipe

DISTRIBUTOR

Figure 22

Remove or Disconnect

1. Spark plug and ignition harnesses from ignition coil and spark plugs.
 - Do not remove wires from distributor unless necessary.
2. Distributor vacuum harness.

Important

- Do not allow foreign material to enter open vacuum lines.
 - Cap ends as necessary.
3. Distributor bolts (47) and distributor (49).

OIL PAN

Figures 23 and 24

Remove or Disconnect

1. Oil level sensor.
 - Oil level sensor must be removed to prevent it from being damaged as oil pan is removed.
2. Oil pan bolts, nuts, and studs.
3. Oil pan, reinforcements, and gasket.
4. Oil filter adapter bolts and washers.
5. Oil filter adapter and gasket.

CRANKSHAFT POSITION SENSOR

Figure 25

Remove or Disconnect

1. Bolt from engine front cover.
2. Sensor from engine front cover.

Figure 11 - Exhaust Manifolds

Figure 12 - Valve Rocker Arm Cover

Figure 13 - Valve Rocker Arm, Ball, and Nut

ENGINE FRONT COVER

Figure 26

Remove or Disconnect

1. Engine front cover bolts (5).
2. Engine front cover (4) and gasket (1).

CRANKSHAFT POSITION SENSOR RELUCTOR RING

Figure 27

Remove or Disconnect

1. Reluctor ring from crankshaft.
2. Key, if necessary.

CAMSHAFT TIMING CHAIN, CRANKSHAFT AND CAMSHAFT SPROCKETS, AND WATER PUMP DRIVESHAFT ASSEMBLY

Figures 28, 29, and 30

Tools Required:

- J 39243-1 Water Pump Driveshaft Assembly Removal
- J 39243-2 Water Pump Driveshaft Assembly Removal
- J 5825-A Crankshaft Sprocket Removal

Remove or Disconnect

1. Camshaft sprocket bolts (56).

Figure 14 - Valve Pushrods

Figure 16 - Removing Valve Lifters

Figure 15 - Valve Lifters, Valve Lifter Guide, and Valve Lifter Guide Retainer

NOTICE: To prevent damage to piston or valves, do not turn the crankshaft after the camshaft timing chain has been removed.

2. Camshaft sprocket (57) and camshaft timing chain (61).
3. Water pump driveshaft bolts (64) and driveshaft assembly (63) using J 39243-1 and J 39243-2.
4. Crankshaft sprocket (62) using J 5825-A.
5. Key, if necessary.

CAMSHAFT

Figures 31 and 32

1. Oil pump driveshaft assembly bolt and oil pump driveshaft assembly.
2. Camshaft retainer bolts and retainer.

Figure 17 - Removing Valve Lifters

NOTICE: All camshaft journals are the same diameter so care must be used in removing the camshaft to avoid damage to the bearings.

3. Camshaft.
 - A. Install three 5/16 - 18 x 4.0 in. bolts in camshaft front bolt holes.
 - B. Carefully rotate and pull camshaft out of bearings.

CYLINDER HEAD

Figures 33 and 34

Remove or Disconnect

1. Engine coolant air bleed pipe bolts and pipe.
 - Use a backup wrench on pipe fitting when removing bolts.
2. Generator bracket bolts and bracket from right cylinder head.

Figure 18 - Mechanical Fan Bracket

3. Cylinder head bolts.

NOTICE: After removal, place the cylinder head on two wood blocks to prevent damage.

4. Cylinder head and gasket.

5. Ignition coil studs, coil and bracket from cylinder head.

OIL PUMP

Figure 35

Remove or Disconnect

1. Crankshaft oil deflector nuts.
2. Bolt attaching oil pump to rear crankshaft bearing cap.
3. Crankshaft oil deflector, oil pump, retainer, and driveshaft.

PISTON AND CONNECTING ROD ASSEMBLY

Figures 36 and 37

Tool Required:

J 5239 Connecting Rod Bolt Guide Set

Remove or Disconnect

1. Ring ridge.
 - A. Turn crankshaft until piston is at bottom of its stroke.
 - B. Place a cloth on top of piston.
 - C. Use a ridge reamer to remove cylinder ring ridge.
 - D. Turn crankshaft so piston is at top of its stroke.
 - E. Remove cloth and cutting debris.

Figure 19 - Water Pump

Figure 20 - Crankshaft Balancer and Hub

Figure 21 - Crankshaft Balancer Hub, Bolt, and Washer

! Important

- Place matchmarks or numbers on connecting rods and connecting rod caps. Connecting rod caps must be assembled to their original connecting rods.
2. Connecting rod nuts.

Figure 22 - Distributor

3. Connecting rod cap and bearings.
 - If re-using, keep bearings with their original connecting rod and connecting rod cap.
 - Wipe oil from bearings and crankpins.
4. Connecting rod and piston out of top of engine block using J H5239.

CRANKSHAFT REAR OIL SEAL HOUSING AND CRANKSHAFT

Figures 38, 39, and 40

↔ Remove or Disconnect

1. Crankshaft rear oil seal housing nuts and bolts.
2. Crankshaft rear oil seal housing, rear oil seal, and rear oil seal housing gasket.
3. Crankshaft rear oil seal from crankshaft rear oil seal housing.
4. Crankshaft bearing cap bolts and studs.
5. Crankshaft bearing caps.
6. Crankshaft.
7. Crankshaft bearings from engine block.
8. Crankshaft bearings from crankshaft bearing caps.

Figure 23 - Oil Pan, Reinforcements, and Gasket

Figure 25 - Crankshaft Position Sensor

Figure 24 - Oil Cooler Adapter, Seals, and Oil Filter

CAMSHAFT BEARINGS

Figures 41 and 42

Tool Required:

J 6098-01 Camshaft Bearing Removal and Installation

Remove or Disconnect

1. Camshaft rear bearing hole plug.
2. Inner camshaft bearings using J 6098-01.
 - A. With nut and thrust washer installed to end of puller screw threads, index pilot in camshaft front bearing and install puller screw through pilot and bearing to be removed.
 - B. Install bearing tool with shoulder toward bearing. Make sure that enough threads are engaged.
 - C. Using two wrenches, hold puller screw while turning nut to draw bearing out of bore.
 - When bearing has been pulled from bore, remove bearing tool and bearing from puller screw.
 - D. Repeat above steps for remaining inner camshaft bearings.
 - Index pilot in rear camshaft bearing to remove rear inner bearing.
3. Front and rear camshaft bearings using J 6098-01.
 - A. Assemble bearing tool to driver handle.
 - B. Drive front and rear bearings out, toward center of engine block.

Figure 26 - Engine Front Cover

Figure 27 - Crankshaft Position Sensor Reluctor Ring

CLEANING, INSPECTION AND REPAIR

ENGINE BLOCK

Figures 43 and 44

Remove or Disconnect

1. Engine block core plugs.
2. Front and rear oil gallery plugs.
3. Fuel pump/oil pressure switch.

Clean

- Engine block in solvent.
- Gasket surfaces.
- Coolant passages.
- Oil passages.

Inspect

- For cracks in cylinder walls, coolant jacket, valve lifter bores and crankshaft bearing webs.

Figure 28 - Camshaft, Sprockets, and Water Pump Driveshaft Assembly

Measure

- Cylinder bores for taper, out-of-round, or excessive ring ridge at top of ring travel. Use a dial indicator. Compare measurements to "Specifications" in this section.
- Cylinders with less than 0.025 mm (0.0010 in.) of wear or taper may be reconditioned with a hone.
- Cylinders with more than 0.025 mm (0.0010 in.) of wear or taper must be bored and honed to smallest oversize piston that will permit complete resurfacing of all cylinders.

Boring

1. Draw a flat file across top of engine block several times to remove any burrs or gasket material. If engine block surface is not completely smooth and flat, boring bar may be tilted which would result in cylinder having an incorrect angle to crankshaft.

2. Measure piston to be installed 11.5 mm (0.45 in.) from bottom of piston skirt and at right angles to piston pin.
3. Bore cylinder to same diameter as piston.
4. Hone cylinder as outlined below to provide specified clearance.

- Follow instructions provided by manufacturer of boring equipment being used.

NOTICE: Handle pistons with care. Do not attempt to force them into the cylinder. The pistons may be easily distorted.

Honing

1. Follow instructions provided by manufacturer of honing equipment being used.
2. Occasionally during honing operation:
 - A. Clean cylinder bore.
 - B. Measure cylinder bore for proper piston fit.

Figure 29 - Water Pump Driveshaft Assembly Removal

Figure 30 - Crankshaft Sprocket Removal

3. Finish operation with a 45 to 65 degree cross-hatch pattern on cylinder walls.

- Finish marks should be clean but not sharp, free from imbedded particles and torn or faded metal.

4. Place a permanent mark on each piston to match it to its proper cylinder.

Figure 31 - Oil Pump Driveshaft Assembly

Figure 32 - Removing the Camshaft

Clean

- Cylinder bores and block with hot water and detergent using a stiff bristle brush. Rinse thoroughly and dry with a clean cloth.
- Any abrasive material left in cylinder bores will cause rapid wear of piston rings, bearings, and other engine assembly parts.

Figure 33 - Engine Coolant Air Bleed Pipe

Figure 34 - Cylinder Head and Gasket

Figure 35 - Oil Pump, Crankshaft Oil Deflector, Driveshaft, and Retainer

Figure 36 - Piston and Connecting Rod Assembly

Figure 37 - Connecting Rod Guide Tool

Figure 38 - Crankshaft Rear Oil Seal Housing, Housing Gasket, and Rear Oil Seal

Figure 39 - Crankshaft Rear Oil Seal Removal

Figure 40 - Crankshaft, Crankshaft Bearings, and Crankshaft Bearing Caps

Figure 41 - Camshaft Inner Bearing Removal

Figure 42 - Camshaft Outer Bearing Removal

- Do not use kerosene or gasoline for cleaning.
- After cleaning, swab cylinder bores with light engine oil and a clean cloth. Then wipe them out with a clean dry cloth.

CRANKSHAFT BEARING FIT

Figure 45

If replacing rear crankshaft bearing, check for correct part number. Some rear crankshaft bearings are 0.20 mm (0.008 in.) wider than standard. Crankshaft will be identified by "0.008" stamped on rear counterweight.

It is necessary to measure clearance of each crankshaft bearing to determine proper sizes. Factory installed crankshaft bearings may not be same size for each journal.

Figure 43 - Checking Block Surface For Flatness

Figure 44 - Measuring the Piston

Inspect

- Lower half of crankshaft bearing.
 - If lower half is worn or damaged, both upper and lower half should be replaced.
 - If lower half is suitable for use, upper half will also be suitable for use.

Measure

- Crankshaft bearing clearance using gaging plastic.
 - Place a piece of gaging plastic full width of crankshaft bearing onto journal.
 - Measure all five bearing clearances at same time.

Important

- Do not rotate crankshaft while gaging plastic is between journal and crankshaft bearing.

Figure 45 - Plastic-gage

- C. Install crankshaft bearing caps with arrows pointing toward front of engine block.
- D. Install bearing cap bolts and studs.

Tighten

- Crankshaft bearing cap bolts and studs to 105 N.m (77 lb. ft.).
- E. Remove crankshaft bearing cap bolts, studs, crankshaft bearing caps.
- F. Measure gaging plastic at its widest using scale provided with gaging plastic. Refer measurements to "Specifications" in this section.
 - If gaging plastic shows an irregularity in journal exceeding 0.025 mm (0.0010 in.), measure journal with a micrometer.
 - If clearance is greater than specified, select an undersize bearing and re-measure clearance. Always replace both upper and lower crankshaft bearings as a unit.

- If clearance cannot be brought to specifications using a standard undersize bearing, regrind crankshaft for use with next undersize bearing.

CRANKSHAFT

Figures 46 and 47

Clean

- Crankshaft in solvent and dry it with compressed air.

Measure

- Crankpins for out-of-round, taper, or undersize with a micrometer. Refer to "Specifications" in this section.
- Crankshaft run-out at front and rear intermediate journals with a dial indicator. Support crankshaft front and rear journals on V-blocks. Refer to "Specifications" in this section.
- Replace or recondition crankshaft if measurements are not within specifications.

PISTON AND CONNECTING ROD ASSEMBLY

Figures 48 through 54

Tool Required:

J 24086-C Piston Pin Removal and Installation Set

Disassemble

1. Piston rings from piston.
2. Piston pin from piston and connecting rod using J 24086-C.

Figure 46 - Measuring Crankshaft Runout

Figure 47 - Measuring Crankshaft Journals

Figure 49 - Removing the Piston Pin

Figure 48 - Piston and Connecting Rod Components

Clean

1. Connecting rod in cleaning solvent.
2. Dry connecting rod with compressed air. Do not wire brush any part of piston.
3. Varnish from piston skirts and pins with cleaning solvent.
4. Piston ring grooves with groove cleaner.
5. Piston oil ring holes and slots.

Inspect

- Connecting rod for twisting, nicks and cracks. Replace any damaged connecting rods.
- Piston for:
 - Cracked ring lands, skirts, or pin bosses.
 - Grooves for nicks or burrs that may cause binding.
 - Warped or worn ring lands.
 - Scuffed or damaged skirts.
 - Eroded areas at top of piston.
 - Worn piston bores and piston pins.
 - Replace pistons that are damaged or show signs of excessive wear.

Measure

1. Piston pin bore-to-piston pin clearance.
 - A. Piston pin bores and piston pins must be free of varnish or scuffing when being measured.
 - B. Use a micrometer to measure piston pin and an inside micrometer to measure piston pin bore.
 - C. If clearance is in excess of 0.025 mm (0.0010 in.), piston and piston pin should be replaced. Piston and piston pin are matched and are not serviced separately.
2. Piston compression ring end gap.

Figure 50 - Measuring Piston Ring Side Clearance

Figure 51 - Measuring Piston Ring End Gap

Figure 52 - Measuring Piston Diameter

Figure 53 - Installing Piston Pin

Figure 54 - Piston Ring Gap Locations

! Important

- Fit each compression ring to cylinder in which it will be used.
 - A. Place compression ring into cylinder bore.
 - B. Push compression ring into cylinder bore to approximately 6.5 mm (0.25 in.) above ring travel. Ring must be square to cylinder wall.
 - C. Measure end gap with a feeler gage. Refer to "Specifications" in this section for acceptable end gaps.
 - D. If end gap exceeds specifications, select another size ring set.
- 3. Piston ring side clearance.
 - A. Roll piston ring entirely around its ring groove on piston.
 - B. If any binding is caused by ring groove, dress groove with a fine cut file.
 - C. If any binding is caused by a distorted piston ring, replace piston ring.

- D. Measure side clearance of piston ring and groove with a feeler gage. For acceptable side clearances, refer to "Specifications" in this section.
- E. If side clearance is too small, try another piston ring.
- 4. Piston-to-cylinder bore clearance to determine suitability of a used piston. Measure piston-to-cylinder bore clearance as follows:
 - A. Measure cylinder bore diameter at a point 64 mm (2.5 in.) from top of cylinder bore using a bore gage.
 - B. Measure piston 11.5 mm (0.45 in.) from bottom of skirt at right angles to piston pin using a caliper or micrometer.
 - C. Subtract piston diameter from cylinder bore diameter. This will indicate piston-to-bore clearance.
 - D. Compare measurements to "Specifications" in this section.
 - E. If clearance exceeds specifications, subtract size of new piston from cylinder bore diameter previously measured.
 - F. If clearance with new piston is within specifications, mark that piston to cylinder to which it is to be installed.
 - G. If clearance is within specifications, used piston may be reinstalled.

Assemble

Important

- When assembling piston and connecting rod, stamped arrow on piston must point to front of engine block. The flange on connecting rod must face toward front of piston on left hand assembly and face toward rear of piston on right hand assembly.

NOTICE: After J 24086-C installer bottoms on support assembly, do not exceed 34 475 kPa (5000 psi) or the tool may be damaged.

1. Piston and connecting rod.
 - A. Lubricate piston pin holes in both piston and connecting rod assembly.
 - B. Press piston pin into piston and connecting rod using J 24086-C.

Inspect

- For freedom of movement of piston on piston pin.
- 2. Piston rings onto piston.
 - Marked side of piston rings must face toward top of piston. Locate piston ring gaps as shown (Figure 54).
 - A. Install oil ring spacer in groove.
 - B. Hold spacer ends together and install lower oil ring rail with gap properly located.

- C. Install upper oil ring rail with gap properly located.
- D. Flex oil ring assembly to make sure rings are free.
- E. Install lower compression ring with gap properly located.
- F. Install upper compression ring with gap properly located.

CONNECTING ROD BEARINGS

Connecting rod bearings are the precision insert type and do not use shims for adjustment. Do not file connecting rods or rod caps. If clearances are found to be excessive, a new bearing will be required. Service bearings are available in standard size and 0.025 mm (0.001 in.) and 0.05 mm (0.002 in.) undersize for use with new and used standard size crankshaft, and in 0.25 mm (0.010 in.) and 0.5 mm (0.020 in.) undersize for use with reconditioned crankshaft.

When removing a connecting rod cap, you may find a 0.25 mm (0.010 in.) undersize bearing. These are used in manufacturing for selective fitting.

Inspect

- Bearings for excessive wear or damage.

Measure

1. Crankpin for out-of-round and taper with a micrometer. Refer measurements to "Specifications" in this section.
 - If not within specifications, replace or recondition crankshaft.
 - If installing new bearings, determine new bearing size from maximum crankpin diameter.
2. Bearing clearances using gaging plastic.
 - A. Place a piece of gaging plastic full width of bearing, (parallel to crankshaft) onto crankpin.
 - Plastic gage should be positioned in middle of bearing. Bearing is thickest in center and bearing clearance must be measured at this location.
 - B. Install connecting rod cap with bearing onto connecting rod.
 - C. Install connecting rod nuts.

Tighten

- Connecting rod nuts, evenly, to 27 N·m (20 lb. ft.) plus an additional 55 degrees.

Important

- Do not turn crankshaft with gaging plastic installed or accuracy of measurement will be affected.
- D. Remove connecting rod nuts and cap.
- E. Measure gaging plastic at its widest using scale provided with gaging plastic. Refer measurements to "Specifications" in this section.

- F. If clearance is greater than specified, select an undersize bearing and re-measure clearance.
- G. If clearance cannot be brought to specifications, regrind crankpin. If crankpin is already at maximum undersize, replace crankshaft.

OIL PUMP

Figures 55 and 56

Tool Required:

J 21882 Oil Pump Screen Installation

Disassemble

- Oil pump cover bolts (5) and oil pump cover (4).
 - Matchmark gear teeth for assembly.
- Driven gear (7), drive gear (7), driveshaft (9), and retainer (8), from oil pump housing (10).
- Oil pressure relief valve pin (1), relief valve (3), and spring (2).
- Oil pump screen (6) from oil pump housing (10), if replacement is necessary.
 - Mount oil pump housing (10) in a soft-jaw vise and extract oil pump screen (6).
 - Oil pump screen (6) is serviced as a unit. Do not disturb pipe on screen.

Figure 55 - Oil Pump Components

Clean

- All parts in cleaning solvent.
- Dry parts with compressed air.

Inspect

- Oil pump housing (10) and cover (4) for cracks, scoring, casting imperfections, and damaged threads.
- Drive gear shaft. If loose in oil pump housing (10), replace oil pump.
- Pressure relief valve (3) for scoring and sticking. — Burrs may be removed with a fine oil stone.
- Relief valve spring (2) for loss of tension.
- Oil pump screen (6) for broken wire mesh or looseness.
 - If pipe is loose or has been removed from screen, oil pump screen (6) must be replaced.
- Gears for chipping, galling, and wear.
- Drive gear (7) and driveshaft (9) for looseness and wear.

Important

— If wear is noted, replace entire oil pump.

Assemble

Important

- Be careful not to twist, shear, or collapse oil pump screen (6) while installing it to oil pump housing.
- A new oil pump screen (6), if previously disassembled, to oil pump housing (10).
 - Mount oil pump housing (10) in a soft-jaw vise.
 - Apply sealer to end of pipe.
 - Tap oil pump screen into place using J 21882 and a plastic-faced hammer.

Figure 56 - Installing the Oil Pump Screen

**Important**

- Replace the pressure relief valve spring when reusing the oil pump.
- 2. Relief valve (3), spring (2), and pin (1).
- 3. Drive gear (7), driveshaft (9), and retainer (8) to oil pump housing (10).
- 4. Driven gear (7) to oil pump housing (10) with smooth side of gear toward oil pump cover (4).
- 5. Oil pump cover (4).
- 6. Oil pump cover bolts (5).

**Tighten**

- Oil pump cover bolts to 9 N-m (80 lb. in.).

**Inspect**

- For smoothness of operation by turning oil pump driveshaft (9) by hand.

CYLINDER HEAD**Figures 57 through 66****Tools Required:**

- J 8001 Dial Indicator Set
- J 9666 Valve Spring Tester
- J 8062 Valve Spring Compressor
- J 8358 Carbon Removing Brush

**Disassemble**

1. Spark plugs from cylinder head.
2. Compress valve springs (69) using J 8062.
3. Valve stem keys (72).
4. Cap (70) from valve.
5. Valve spring (69).
6. Valve seal (73).
7. Valve (71).

- Place valves in rack in proper sequence so they can be assembled in their original order.

**Clean**

1. Carbon from combustion chambers and valve parts using J 8358.
 - Be careful not to scuff chamber
2. Valve guides.
3. Carbon and sludge from valve pushrods and valve rocker arms.
4. Valve stems and heads on buffing wheel.
5. Cylinder head and engine block gasket surfaces.
6. Bolt hole threads in cylinder head and engine block.

**Inspect**

1. Cylinder head for cracks in exhaust ports, combustion chambers, or external cracks to water chamber.
2. Valves for burned heads, cracked faces, or damaged stems.
3. Valve springs for squareness.

**Figure 57 - Compressing Valve Spring****Figure 58 - Valve and Components**

Figure 59 - Valve and Components

Figure 60 - Cleaning Combustion Chamber

Measure

1. Valve spring tension using J 9666.
 - If spring tension is less than 340 N (76 lb.) at 43.2 mm (1.70 in.), replace spring (69).
2. Valve stem-to-bore clearance.
 - A. Excessive valve stem-to-bore clearance will cause excessive oil consumption and may cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of valve and disturb engine assembly smoothness.

Figure 61 - Checking Valve Spring Tension

Figure 62 - Measuring Valve Stem Clearance

- B. Clamp J 8001 on exhaust port side of cylinder head.
- C. Locate indicator so movement of valve stem from side to side (crosswise to cylinder head) will cause a direct movement of indicator stem. Indicator stem must contact side of valve stem just above valve guide.
- D. Drop valve head about 1.6 mm (0.0064 in.) off valve seat.
- E. Move stem of valve from side to side using light pressure to obtain a clearance reading. If clearance exceeds specifications, it will be necessary to ream valve guides for oversize valves. Refer to "Specifications" in this section.
- F. Service valves are available in standard 0.076 mm (0.003 in.) and 0.038 mm (0.015 in.), 0.76 mm (0.030 in.) oversize.

Figure 63 - Measuring Valve Spring Installation Height

Figure 64 - Removing the Valve Rocker Arm Stud

Figure 65 - Reaming the Stud Bore

Figure 66 - Installing the Valve Rocker Arm Stud

Recondition

1. Valves with oversize stems are available as outlined above. Ream valve guide bores for oversize valves as necessary.
2. Reconditioning valve seats is very important. Valve seat reconditioning must be done after reaming valve guide bores or installing new valve guides.
 - Seating of valves must be perfect for engine assembly to deliver optimum power and performance.
 - Another important factor is cooling of valve heads. Good contact between each valve and its seat in cylinder head is necessary to insure that heat in valve head will be properly carried away.
 - Several different types of equipment are available for reconditioning valve seats. Recommendations of manufacturer of equipment being used should be carefully followed to attain proper results.
 - Regardless of what type of equipment is used, it is essential that valve guide bores be free from carbon or dirt to ensure proper centering of pilot in guide. Valve seats should be concentric to within 0.05 mm (0.002 in.) total indicator reading.

3. Valves that are pitted can be refaced to proper angle, insuring correct relation between head and stem, on a valve refacing mechanism. Valve stems which show excessive wear, or valves that are warped excessively should be replaced. If edge of valve head is less than 0.79 mm (0.031 in.) thick after grinding, replace valve.

- Several different types of equipment are available for refacing valves. Recommendation of manufacturer of equipment being used should be carefully followed to attain proper results.

Assemble

1. Valve (71) into proper port.
2. Valve seal (73) lightly against cylinder head.
3. Valve spring (69).
4. Cap (70) on valve stem.
5. Compress valve spring (69) using J 8062.
6. Valve stem keys (72).
 - A. Use grease to hold keys (72) in place while disconnecting J 8062.
 - B. Make sure keys (72) seat properly in upper groove of valve stem.
 - C. Tap end of stem with a plastic-faced hammer to seat keys (72), if necessary.
7. Remaining valves.

Measure

- Valve spring installed height from valve spring seat to locating surface on cap.
 - If installed height exceeds 44.2 mm (1.74 in.), install valve seat spring shim approximately 1.6 mm (0.0625 in.) thick.
 - Do not shim valve spring to obtain a less than specified installed height.

ROCKER ARM STUD REPLACEMENT

Figures 64, 65, and 66

Tools Required:

- J 5802-01 Valve Rocker Arm Stud Removal
- J 5715 Reamer (0.0762 mm (0.003 in.) oversize) or
- J 6036 Reamer (0.3302 mm (0.013 in.) oversize)
- J 6880 Valve Rocker Arm Stud Installation

Valve rocker arm studs that have damaged threads or are loose in cylinder heads should be replaced. New studs are available in 0.0762 mm (0.003 in.) and 0.3302 mm (0.013 in.) oversize.

1. Place J 5802-01 over the stud to be removed. Install a nut and flat washer. Remove the stud by turning the nut.
2. Ream the hole to the proper size for the replacement oversize stud. Use J 5715 for 0.0762 mm (0.003 in.) oversize studs, J 6036 for 0.3302 mm (0.013 in.) oversize studs.

3. Coat lower end (press-fit area) of stud with hypoid axle lubricant. Drive the stud into place with a hammer and J 6880. Stud is installed to proper depth when the tool bottoms on the cylinder head.

CAMSHAFT

Figures 67 and 68

Tool Required:

J 7872 Magnetic Base Indicator Set

Measure

1. Camshaft journals with micrometer.
 - If journals are more than 0.025 mm (0.0010 in.) out-of-round, replace camshaft.
2. Camshaft runout using J 7872.
 - Mount camshaft in V-blocks or between centers. Using J 7872, check intermediate camshaft journal. If runout exceeds 0.065 mm (0.0026 in.), camshaft is excessively bent and should be replaced.

CRANKSHAFT POSITION SENSOR RELUCTOR RING

Inspect

- Crankshaft position sensor reluctor ring for knicks, scratches, or damage to the lugs.
- Crankshaft position sensor reluctor ring for worn keyway.

CAMSHAFT TIMING CHAIN, CRANKSHAFT AND CAMSHAFT SPROCKETS, AND WATER PUMP DRIVESHAFT ASSEMBLY

Inspect

- Camshaft and crankshaft sprockets and water pump driveshaft assembly for wear.

Figure 67 - Measuring Camshaft Journals

Figure 68 - Measuring Camshaft Runout

- One edge of teeth worn or teeth no longer concentric.
- Valley between teeth worn.
- Key and crankshaft keyway for wear.
- Camshaft timing chain for binding.

ENGINE FRONT COVER

Clean

- Engine front cover for damage to seals, gasket surfaces, and crankshaft position sensor bore.

Inspect

- Engine front cover for damage to seals or gasket surface.

ENGINE FRONT COVER OIL SEALS

Tools Required:

- J 35468 Engine Front Cover Alignment and Oil Seal Installation
- J 39937 Engine Front Cover Distributor Shaft Oil Seal Installation
- J 39088 Engine Front Cover Water Pump Driveshaft Assembly Oil Seal Installation

Remove or Disconnect

- Engine front cover oil seals for crankshaft, distributor shaft, and water pump driveshaft assembly.

Install or Connect

1. Crankshaft hub oil seal using J 35468.
2. Distributor driveshaft oil seal using J 39937.
3. Water pump driveshaft oil seal using J 39088.

OIL PAN

Clean

- Oil pan in solvent. Remove all sludge and varnish.
- Gasket surfaces.

Inspect

- Gasket flanges for bending or damage.
- Oil pan for rock damage or cracks.
- Crankshaft oil deflector for lack of fit.
- Oil pan drain plug opening for stripped threads.

WATER PUMP

Tool Required:

- J 39089 Water Pump Driveshaft Assembly O-Ring Seal Installation

Clean

- Water pump and engine block gasket surfaces.

Inspect

- O-ring seals on water pump driveshaft assembly and water pump shaft. Replace seals, if necessary using J 39089.

VALVE LIFTERS

Inspect

- Valve lifter body for wear and scuffing. Also inspect bore in engine block for scuffing.
- Valve lifter roller for:
 - Binding or roughness.
 - Excessive looseness in roller bearings.
 - Flat spots.
 - Pitting.
- Valve lifter pushrod seat and valve pushrod end for wear or scoring.

VALVE ROCKER ARMS AND VALVE PUSHRODS

Inspect

- Valve rocker arms and balls at their mating surfaces. These surfaces should be smooth and free of scoring or other damage.
- Valve rocker arm valve pushrod sockets and valve stem mating surfaces. These surfaces should be smooth with no scoring or exceptional wear.
- Valve pushrods for scored ends or bends.

VALVE ROCKER ARM COVERS

Clean

- Valve rocker arm cover and cylinder head gasket surfaces.

Inspect

- Gasket flanges for damage.
- Rubber grommets for deterioration.

INTAKE MANIFOLD

Clean

- Intake manifold bolts and studs.
- All intake manifold sealing surfaces.
- Remove old RTV from intake.

ASSEMBLY

ENGINE BLOCK

Install or Connect

1. Engine block core plugs.
2. Front and rear oil gallery plugs.
3. Oil filter adapter, with new adapter seal.
4. Oil filter adapter bolts and washers.
5. Fuel pump/oil pressure switch.
6. Knock sensor and drain plug.

Tighten

- Rear engine block oil gallery plugs to 20 N·m (15 lb. ft.).
- Knock sensors to 20 N·m (15 lb. ft.).
- Engine block coolant drain plug to 20 N·m (15 lb. ft.).
- Oil filter adapter bolts to 25 N·m (18 lb. ft.).
- Oil filter to 21 N·m (15 lb. ft.).
- Fuel pump/oil pressure switch to 12 N·m (106 lb. in.).

CAMSHAFT BEARINGS

Figures 69, 70, and 71

Tool Required:

J 6098-01 Camshaft Bearing Removal and Installation

Outer front and rear camshaft bearings must be installed first. These bearings serve as guides for tool pilot, and help center inner bearings during installation process.

Important

- Align camshaft bearing oil holes properly during installation.
- Number one (front) camshaft bearing oil holes must be positioned so that they are at 1 o'clock and 5 o'clock positions.

Figure 69 - Installing Camshaft Outer Bearings

Figure 70 - Installing Camshaft Inner Bearings

- Number two through number four inner camshaft bearing oil holes must be positioned at 5 o'clock toward left side of engine block and even with bottom of cylinder bore.
- Number five (rear) camshaft bearing oil hole must be positioned at 12 o'clock.

Install or Connect

1. Front and rear camshaft bearings using J 6098-01.
 - A. Assemble bearing tool to driver handle.
 - B. Align oil holes as outlined above.
 - C. Drive front and rear bearings in, toward center of engine block.
2. Inner camshaft bearings using J 6098-01.
 - A. With nut and thrust washer assembled to end of puller screw threads, index pilot in camshaft front bearing and install puller screw through pilot.

Figure 71 - Camshaft Rear Bearing Hole Plug

- B. Index camshaft bearing in bore, aligning oil hole as outlined above.
- C. Install puller screw through bearing bore and bearing to be installed and assemble bearing tool to puller screw with shoulder toward bearing. Make sure that enough threads are engaged.
- D. Using two wrenches, hold puller screw while turning nut to draw bearing into bore.
 - When bearing has been pulled into bore, remove bearing tool and puller screw and check alignment of bearing oil hole to bore oil hole.
- E. Repeat above steps for remaining inner camshaft bearings.
 - Index pilot in rear camshaft bearing to install rear inner bearing.
3. New camshaft rear bearing hole plug (68).
 - A. Coat plug outside diameter with GM P/N 1052080 sealant, or equivalent.
 - B. Install camshaft rear bearing hole plug (68) as shown (Figure 71).

CRANKSHAFT

Figures 72 and 73

Install or Connect

1. Crankshaft bearings into engine block and crankshaft bearing caps.
 - Coat crankshaft bearings with oil.

Figure 72 - Crankshaft, Crankshaft Bearings, and Crankshaft Bearing Caps

2. Crankshaft.
3. Crankshaft bearing caps with assembled crankshaft bearings. Cap directional arrows must point toward front of engine block.
4. Crankshaft bearing cap bolts and studs.
 - With crankshaft, crankshaft bearings, crankshaft bearing caps installed, and bolts and studs started, thrust crankshaft rearward to set and align bearing caps. Then thrust crankshaft forward to align rear faces of rear crankshaft bearings.

Tighten

- Crankshaft bearing cap bolts and studs to 105 N·m (77 lb. ft.).

Measure

- Crankshaft end play using a dial indicator or feeler gage. Refer to "Specifications" in this section.
 - If using a feeler gage, measure between front of rear crankshaft bearing cap and crankshaft thrust surface.

Figure 73 - Checking Crankshaft End Play

CRANKSHAFT REAR OIL SEAL HOUSING

Figure 74

Clean

- Gasket surfaces.

Install or Connect

1. New gasket and crankshaft rear oil seal housing on studs.

Important

- Always use new crankshaft rear oil seal and new crankshaft rear oil seal housing gasket during installation of crankshaft rear oil seal housing.
 - It is not necessary to use any type of sealant to hold gasket in place.
2. Crankshaft rear oil seal housing nuts and bolts.

Tighten

- Crankshaft rear oil seal housing nuts and bolts to 15 N·m (11 lb. ft.).

Figure 74 - Crankshaft Rear Oil Seal Housing

CRANKSHAFT REAR OIL SEAL

Figure 75

Tool Required:
J 35621 Crankshaft Rear Oil Seal
Installation

Install or Connect

1. Coat new oil seal entirely with clean engine oil.
2. Oil seal onto J 35621.

NOTICE: Crankshaft sealing surface and chamfer must be free of nicks and burrs to prevent damage to the lip of the seal.

3. J 35621 onto rear of crankshaft. Tighten screws snugly to ensure seal will be installed squarely over crankshaft.
4. Crankshaft rear oil seal to crankshaft and crankshaft rear oil seal housing.
- Tighten wing nut on J 35621 until it bottoms.
5. Remove J 35621 from crankshaft rear oil seal housing.

PISTON AND CONNECTING ROD ASSEMBLY

Figures 76, 77, and 78

Tools Required:
J 8037 Piston Ring Compressor
J 5239 Connecting Rod Bolt Guide Set

Install or Connect

1. Coat piston, piston rings, cylinder bore, and bearing surfaces with engine oil.

Figure 75 - Crankshaft Rear Oil Seal Installation Tool

2. Piston with stamped arrow facing forward and connecting rod assembly into its matched bore. Use J 8037 and J 5239 and lightly tap top of piston with wooden hammer handle.
 - Hold J 8037 firmly against engine block until all piston rings have entered cylinder bore.
 - Guide connecting rod assembly using J 5239.
3. Remove J 5239.

CONNECTING ROD BEARINGS

Figure 79

Install or Connect

1. Coat inside surface of bearings with engine oil.

Important

- When assembled, flanges on connecting rod and cap should face to front in left bank and to rear in right bank.
2. Connecting rod cap and bearings.
 3. Connecting rod nuts.

Tighten

- Connecting rod nuts, evenly, to 27 N·m (20 lb. ft.) plus an additional 55 degrees.

Measure

1. When all connecting rod bearings have been installed, tap each connecting rod lightly parallel to crankpin to make sure they have clearance.
2. Side clearance between connecting rod caps using a feeler gage or dial indicator.
 - Rod side clearance should be 0.16 to 0.35 mm (0.006 to 0.014 in.).

Figure 76 - Installing the Piston

Figure 77 - Connecting Rod Guide Tool

OIL PUMP

Figure 80

Install or Connect

1. Oil pump, driveshaft, and retainer.
 - Align slot on end of driveshaft with drive tang on oil pump shaft.

Figure 78 - Installing the Piston and Connecting Rod Assembly

Figure 79 - Measuring Connecting Rod Side Clearance

2. Crankshaft oil deflector.
3. Bolt attaching oil pump to rear crankshaft bearing cap.
4. Crankshaft oil deflector nuts.

Tighten

- Oil pump bolt to 90 N.m (66 lb. ft.).
- Crankshaft oil deflector nuts to 40 N.m (30 lb. ft.).

Figure 80 - Oil Pump, Crankshaft Oil Deflector, Driveshaft, and Retainer

CYLINDER HEAD

Figures 81 and 82

Tools Required:
J 36660 Torque Angle Meter

Install or Connect

1. New cylinder head gasket.
2. Gasket over locating pins, with yellow side of tab on outboard side facing up.
3. Cylinder head over locating pins and gasket.
 - Coat threads of cylinder head bolts with sealing compound GM P/N 1052080 or equivalent.
4. Cylinder head bolts finger tight.

Tighten

- Cylinder head bolts in sequence first pass to 30 N.m (22 lb. ft.) (Figure 82).
- Cylinder head bolts in sequence second pass using J 36660 to:
 - Short bolts (3,4,7,8,11,12,15,16) 55 degrees.
 - Medium bolts (14,17) 65 degrees.
 - Long bolts (1, 2, 5, 6, 9, 10, 13) 75 degrees.

Figure 81 - Cylinder Head and Gasket

Figure 82 - Cylinder Head Tightening Sequence

5. Spark plugs.

6. Engine coolant air bleed pipe and bolts.

Tighten

- Spark plugs to:
 - Spark plugs (cylinder head - new) 30 N.m (22 lb. ft.)
 - Spark plugs (cylinder head - all subsequent installations) 20 N.m (15 lb. ft.)
- Engine coolant air bleed pipe bolts to 40 N.m (30 lb. ft.).
 - Use backup wrench on pipe fittings when installing bolts.

CAMSHAFT

Figures 83 and 84

When installing new camshaft, coat camshaft lobes and journals with engine oil.

When installing a new camshaft, inspect all valve lifters and replace as necessary to ensure durability of camshaft lobes and valve lifter rollers.

Figure 83 - Installing the Camshaft

Figure 84 - Oil Pump Driveshaft Assembly

Install or Connect

1. Install three 5/16 - 18 x 4.0 in. bolts in camshaft front bolt holes.
2. Camshaft.
3. Remove the three bolts from front of camshaft.
4. Camshaft retainer and camshaft retainer bolts.

Tighten

- Camshaft retainer bolts to 12 N.m (106 lb. in.).
5. Oil pump driveshaft assembly and bolt.
 - Bolt hole "ear" must be seated on boss before tightening bolt.

Tighten

- Oil pump driveshaft bolt to 18 N.m (13 lb. ft.).

CAMSHAFT TIMING CHAIN, CRANKSHAFT AND CAMSHAFT SPROCKETS, AND WATER PUMP DRIVESHAFT ASSEMBLY

Figures 85, 86, and 87

Tools Required:

- J 5590 Crankshaft Sprocket Installation
- J 39089 Water Pump Driveshaft Assembly /Water Pump Shaft Seal Installation
- J 415465 Water Pump Driveshaft Assembly Installation

Install or Connect

1. Align key with keyway, if previously removed.
2. Crankshaft sprocket (62) using J 5590.
3. Water pump driveshaft assembly (63) using J 41546.
4. Water pump driveshaft bearing retainer bolts (64).

Tighten

- Water pump driveshaft bearing retainer bolts to 12 N.m (106 lb. in.).
5. Camshaft sprocket (57) and camshaft timing chain (61).
 - Gears must mesh, or damage to camshaft retainer could occur.
 6. Camshaft sprocket bolts (56).
 - Make sure that camshaft and crankshaft sprocket alignment marks align (Figure 87).

Tighten

- Camshaft sprocket bolts to 25 N.m (18 lb. ft.).
7. New O-ring seal to water pump driveshaft assembly (63) using J 39089.

Figure 85 - Installing the Water Pump Driveshaft Assembly

Figure 86 - Installing the Crankshaft Sprocket

CRANKSHAFT POSITION SENSOR RELUCTOR RING

Figure 88

Install or Connect

- Reluctor ring onto crankshaft.

Important

- Align the keyway on the reluctor ring with the key in the crankshaft and install the reluctor ring onto the crankshaft until the ring is completely seated against the crankshaft sprocket.

Figure 87 - Camshaft Timing Chain, Sprockets, and Water Pump Driveshaft Assembly

ENGINE FRONT COVER

Figure 89

Tool Required:
 J 39087 Water Pump Driveshaft Assembly
 Engine Front Cover Oil Seal Protector

Install or Connect

NOTICE: Be careful not to damage oil seal when installing engine front cover over water pump driveshaft assembly.

1. Gasket (1) and engine front cover (4) using J 39087 on water pump driveshaft assembly.
2. Engine front cover bolts (5).

Tighten

- Engine front cover bolts to 12 N.m (106 lb. in.).

Figure 88 - Crankshaft Position Sensor Reluctor Ring

Figure 89 - Engine Front Cover

CRANKSHAFT POSITION SENSOR

Figure 90

! Important

- Do not re-use the O-ring seal on the crankshaft position sensor. Install a new O-ring seal onto the sensor.

↔ Install or Connect

1. Lubricate the O-ring seal of the sensor with clean engine oil.
2. Crankshaft position sensor into engine front cover.

! Important

- When installing the crankshaft position sensor be sure the sensor is fully seated and held stationary in the engine front cover bore. Torque the hold down bolt to the specification shown below. A sensor that is not fully seated will cock in the engine front cover and may result in erratic engine operation.

3. Bolt into cover.

⌚ Tighten

- Bolt to 12 N·m (106 lb. in.).

DISTRIBUTOR

Figure 91

! Important

- Distributor (49) is driven by a camshaft pin that mates to one slot in distributor driveshaft.
- Align distributor driveshaft slot with distributor base timing mark.
- Rotate engine crankshaft until number one piston is at top dead center (intake and exhaust valves closed). Camshaft pin will be at 9 o'clock position.

↔ Install or Connect

1. Distributor (49).

- Before inserting distributor bolts (47), make sure distributor (49) is fully seated to engine front cover. If it is difficult to seat, check alignment of distributor driveshaft slot, timing mark and camshaft pin.

2. Distributor bolts (47).

⌚ Tighten

- Distributor bolts to 12 N·m (106 lb. in.).
3. Ignition coil and bracket and studs.

Figure 90 - Crankshaft Position Sensor

Figure 92 - Oil Pan, Reinforcements, and Gasket

Figure 91 - Distributor

Tighten

- Ignition coil studs to 40 N·m (30 lb. ft.).
- 4. Spark plug and ignition harnesses to distributor (49), if removed, and ignition coil.
- 5. Distributor vacuum harness.

OIL PAN

Figures 92 through 95

Install or Connect

1. Apply a small amount of sealer, GM P/N 12346141 or equivalent, to engine front cover and engine block junction and to crankshaft rear oil seal housing and engine block junction. Apply sealer 25 mm (1.0 in.) in either direction of radius cavity of junctions.
2. Oil pan gasket, oil pan, and reinforcements.
3. Oil pan nuts, bolts, and studs.

Tighten

- Corner bolts or stud, and nuts to 20 N·m (15 lb. ft.).
- Remainder of bolts and studs to 12 N·m (106 lb. in.).
- 4. Oil level sensor.

Figure 93 - Applying Sealant to Front of Engine Oil Pan Surface

Figure 94 - Applying Sealant to Rear of Engine Oil Pan Surface

Tighten

- Oil level sensor to 35 N.m (26 lb. ft.).
- 5. Starter motor and bolts.
- 6. Oil pan drain plug and gasket.

Tighten

- Starter motor bolts to 47 N.m (35 lb. ft.).
- Oil pan drain plug to 20 N.m (15 lb. ft.).

CRANKSHAFT BALANCER AND HUB

Figure 96 and 97

Tool Required:

J 39046 Crankshaft Hub Removal and Installation

Figure 95 - Oil Cooler Adapter and Oil Filter

Install or Connect

1. Crankshaft balancer hub must be installed by following procedure:
 - A. Set number 1 piston to top dead center.
 - B. Install crankshaft balancer hub with cast arrow on hub in 12 o'clock position.
2. Crankshaft balancer hub, until completely seated against the crankshaft position sensor reluctor ring using J 39046.
3. Crankshaft balancer hub washer and bolt.
4. Crankshaft balancer and bolts.

Important

- If crankshaft balancer is replaced, new balancer weights of same size must be installed on the new balancer in same location as old balancer.
 - A. Measure depth of empty balancer weight hole. Record measurement.
 - B. Drive weights in old balancer to bottom of hole then measure depth of hole. Record measurement.
 - C. Subtract measurement of hole with weight from measurement of empty hole. Difference will be the length of balancer weight that must be installed in new balancer in the same location.

Figure 96 - Crankshaft Balancer Hub, Bolt, and Washer

Tighten

- Crankshaft balancer hub bolt to 100 N.m (75 lb. ft.).
- Crankshaft balancer bolts to 85 N.m (63 lb. ft.).

WATER PUMP

Figures 98 and 99

Install or Connect

1. Coupling (39) to water pump shaft with groove on coupling toward engine block.
 - Apply a light coat of grease to O-ring seals (156) and grease to coupling (39).
2. Position water pump (37) and gaskets (38), with tabs straight up, to engine block. Rotate coupling (39), if necessary, to align it to water pump driveshaft splines and then seat water pump.
3. Water pump bolts (40 and 41).

Tighten

- Water pump bolts to 45 N.m (35 lb. ft.).
4. Fan pulley bracket bolts and bracket, if equipped.
 5. Air injection pump bracket and bolts.

Tighten

- Fan pulley bracket bolts to 45 N.m (33 lb. ft.).
- Air injection pump bracket bolts to 40 N.m (30 lb. ft.).

VALVE LIFTERS

Figure 100

Install or Connect

1. Coat valve lifter rollers with prelube, GM P/N 1052365 or equivalent.

Figure 97 - Crankshaft Balancer and Hub

2. Valve lifters in same location from which they were removed.
3. Valve lifter guides, valve lifter guide retainer, and valve lifter guide retainer bolts.

Tighten

- Valve lifter guide retainer bolts to 25 N.m (18 lb. ft.).

VALVE ROCKER ARMS AND VALVE PUSHRODS

Figures 101 through 104

Tool Required:
J 8520 Cam Lobe Lift Indicator

Install or Connect

1. Coat valve rocker arm and valve rocker arm ball bearing surfaces with prelube, GM P/N 1052365 or equivalent, when installing. Keep these components and valve pushrods in same sequence to ensure their return to the original position from which they were removed.
2. Valve pushrods. Make sure valve pushrods seat in valve lifter sockets.

Figure 98 - Water Pump

Figure 99 - Mechanical Fan Bracket

Measure

- Camshaft lobe lift.
 - A. Position J 8520 with ball socket adapter on valve pushrod. Make sure valve pushrod is in valve lifter socket.
 - B. Rotate crankshaft slowly in direction of rotation until valve lifter roller is on heel of cam lobe. At this point, valve pushrod will be in its lowest position.

Figure 100 - Valve Lifters, Valve Lifter Guides, and Valve Lifter Retainer

- C. Set J 8520 on zero.
 - D. Rotate crankshaft slowly until valve pushrod is in fully raised position.
 - E. Compare total lift shown on J 8520 with specifications. Refer to "Specifications" in this section.
 - F. Remove J 8520.
3. Valve rocker arms (3).
 4. Valve rocker arm balls (1) and nuts (2).

Figure 101 - Valve Pushrods

Figure 104 - Adjusting Valve Lash

Adjust

- Valve rocker arm nuts until all lash is eliminated.
 1. Turn crankshaft until cast arrow on crankshaft balancer hub is in 12 o'clock position and number 1 cylinder is in firing position (top dead center).
 - Watch number 1 cylinder valves as crankshaft balancer hub arrow approaches 12 o'clock position. If a valve moves as arrow moves to position, engine assembly is in number 6 cylinder firing position. Crankshaft must then be turned one more time to reach number 1 cylinder firing position.
 2. With engine assembly in number 1 cylinder firing position, following valves can be adjusted:
 - Exhaust 1, 3, 4, 8
 - Intake 1, 2, 5, 7
 3. Back off valve rocker arm nut (2) until lash is felt in valve pushrod (4). Then tighten valve rocker arm nut until all lash is removed. Zero lash can be felt by moving valve pushrod up and down between thumb and forefinger until there is no more movement.
 4. When all free play has been removed, tighten valve rocker arm nut (2) one additional turn (360 degrees).
 5. Turn crankshaft one revolution until hub arrow is again at 12 o'clock position. This is number 6 cylinder firing position. Following valves can now be adjusted:
 - Exhaust 2, 5, 6, 7
 - Intake 3, 4, 6, 8

Figure 102 - Measuring Camshaft Lobe Lift

- 1 BALL, VALVE ROCKER ARM
- 2 NUT, VALVE ROCKER ARM
- 3 ROCKER ARM
- 4 PUSHROD
- 5 STUD, VALVE ROCKER ARM

Figure 103 - Valve Rocker Arm, Ball, and Nut

Figure 105 - Valve Rocker Arm Cover

VALVE ROCKER ARM COVERS

Figure 105

Right Valve Rocker Arm Cover

Install or Connect

1. Gasket and valve rocker arm cover.
2. Valve rocker arm cover bolts.

Tighten

- Valve rocker arm cover bolts to 12 N.m (106 lb. in.).
3. Crankcase vent hose.

Left Valve Rocker Arm Cover

Install or Connect

1. Gasket and valve rocker arm cover.
2. Valve rocker arm cover bolts.

Tighten

- Valve rocker arm cover bolts to 12 N.m (106 lb. in.).

INTAKE MANIFOLD

Figures 106 through 110

Install or Connect

1. Apply a 5 mm (0.197 in.) bead of RTV sealer, GM P/N 12346141 or equivalent, to front and rear of engine block. Extend bead 13 mm (0.5 in.) up each cylinder head to seal and retain gaskets.
2. Intake manifold with new gaskets.
3. Intake manifold bolts and studs.

Figure 106 - Intake Manifold, Fuel Rail, Throttle Body, and Air Cleaner Resonator

Figure 107 - Applying Sealant to the Rear of Block

Figure 108 - Applying Sealant to the Front of Block

Figure 109 - Intake Manifold Tightening Sequence

Figure 110 - Engine Coolant Air Bleed Pipe

Tighten

- Intake manifold bolts and studs in a first pass to 8 N.m (71 lb. in.) in sequence. Tighten in sequence in a second pass to final specifications of 48 N.m (35 lb. ft.) (Figure 109).

4. Throttle body, gasket and bolts.

Tighten

- Throttle body bolts to 25 N.m (18 lb. ft.).

5. Accelerator cable bracket and bolts.

6. Engine coolant air bleed pipe and bolts.

Tighten

- Accelerator control cable bracket bolts to 12 N.m (106 lb. in.).

- Engine coolant air bleed pipe bolts to 40 N.m (30 lb. ft.).

— Use a backup wrench when tightening engine coolant air bleed pipe bolts.

7. EGR valve and nuts.

8. EGR vacuum control solenoid, bracket and nut.

Tighten

- EGR valve nuts to 25 N.m (18 lb. ft.).

- EGR control valve relay nut to 25 N.m (18 lb. ft.).

9. Evaporative emission canister purge valve vacuum hose.

10. EGR and distributor vacuum harness and crankcase vent hoses.

11. Generator bracket and bolts.

Tighten

- Generator bracket bolts, in numerical sequence, to 40 N.m (30 lb. ft.).

Figure 111 - Checking the Exhaust Manifold for Flatness
12. Fuel injectors with fuel rail onto intake manifold.
13. Fuel pressure regulator vacuum tube.
14. Air cleaner resonator bracket and fuel rail bolts.

Tighten

- Fuel rail bolts to 10 N.m (89 lb. in.).
- 15. Wiring harnesses if moved or disconnected.
- 16. MAP sensor and bolts.

Tighten

- MAP sensor bolts to 6 N.m (53 lb. in.).

EXHAUST MANIFOLDS

Figures 111, 112, and 113

Right Exhaust Manifold

Install or Connect

1. Exhaust manifold gasket (18), exhaust manifold (19), and heat shields.
2. Exhaust manifold studs (20), bolts (21), and spacers (245).

Tighten

- Exhaust manifold studs and bolts to 40 N.m (30 lb. ft.).
- 3. EGR valve pipe bolt (229).

Tighten

- EGR valve pipe bolt (229) to 25 N.m (18 lb. ft.).
- 4. Air injection pipe (15) and check valve (11).

Tighten

- Secondary air injection pipe fitting-to-exhaust manifold to 55 N.m (41 lb. ft.).
- 5. Apply sealer, GM P/N 1052080 or equivalent, around oil level indicator tube 13 mm (0.5 in.) below bead.
- 6. Oil level indicator, tube, and bolt to engine block.

Figure 112 - Exhaust Manifolds

Figure 113 - Secondary AIR Injection and EGR Valve Pipes

**Tighten**

- Oil level indicator tube bolt to 12 N.m (106 lb. in.).

7. Spark plug wire harness.

Left Exhaust Manifold**Install or Connect**

1. Exhaust manifold gasket (17), exhaust manifold, and heat shields.
2. Exhaust manifold bolts (21), studs (20), and spacers (245).

**Tighten**

- Exhaust manifold bolts and studs to 40 N.m (30 lb. ft.).
3. Spark plug wire harness.
 4. Air injection pipe (15) and check valve (11).

**Tighten**

- Secondary air injection pipe fitting-to-exhaust manifold to 55 N.m (41 lb. ft.).

ENGINE FLYWHEEL*Figure 114***Install or Connect**

1. Engine flywheel to crankshaft.
 - Align locator hole to pin.
2. Engine flywheel bolts.

**Tighten**

- Engine flywheel bolts to 100 N.m (74 lb. ft.).

Figure 114 - Engine Flywheel

SECTION 6B

COOLING AND RADIATOR

NOTICE: When adding coolant, it is important that you use GM DEX-COOL™ (orange-colored, silicate free) coolant meeting GM Specification 6277M. If silicated coolant is added to the system, premature engine, heater core, or radiator corrosion may result. In addition, the engine coolant will require change sooner - at 50,000 km (30,000 miles) or 24 months.

NOTICE: Antifreeze can be added to raise the boiling point of the coolant, but too much will affect the freezing point. Do not use a solution stronger than 70 percent antifreeze, as the freeze level rises rapidly after this point. Pure antifreeze will freeze at -22°C (-8°F).

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The cooling system is available in three versions. The base version consists of an aluminum core with plastic end tanks, a pressurized coolant recovery reservoir, a gear-driven engine water pump, thermostat, and two electric motor-driven fans. The right-hand end tank of the radiator contains a transmission oil cooler. The extra-capacity cooling system version (RPO VO3) has the same components except that the left-hand electric motor-driven fan has a larger size motor and the left-hand end tank of the radiator is larger to allow for an engine oil cooler provided within that end tank. The heavy-duty cooling system version (RPO VO8) has the same components as the extra-capacity cooling system except that the right-hand electric motor-driven cooling fan is replaced by a belt-driven fluid clutch controlled fan. The coolant hoses connecting the engine to the radiator on the heavy duty cooling system have metal sections for protection from the belt-driven fan blades.

Engine coolant is drawn from the suction side of the radiator through the thermostat (when open) by the water pump and circulated through internal passages in the cylinder heads and engine block. The heated coolant is then directed back to the radiator. A separate coolant flow loop is available from the water pump through hoses to the heater core and back to the water pump to provide passenger compartment heat and defrost.

The cooling system uses a pressurized coolant recovery reservoir to ensure the radiator hoses and engine coolant passages are kept completely full at all normal operating temperatures. Coolant is added to the system only at the coolant recovery reservoir, when the system is cool.

ENGINE COOLANT

This vehicle has a newly developed engine coolant. GM Goodwrench DEX-COOL™ was developed to last for 166,000 km (100,000 miles) or 5 years whichever occurs first. Follow the instructions in "Draining and Refilling Cooling System" in this section. Make sure only GM Goodwrench DEX-COOL™ (orange-colored, silicate free) is used when coolant is added or changed.

A 50/50 mixture of ethylene glycol (DEX-COOL™) and water is recommended and will provide this protection:

- Give freezing protection down to -37°C (-34°F).
- Give boiling protection up to 129°C (265°F).
- Protect against rust and corrosion.
- Help maintain the proper engine temperature.
- Allow the warning lights and gauges work to work properly.

RADIATOR

Cross-Flow Radiator Core and End Tanks

A cross-flow aluminum radiator core is used. Plastic end tanks with gaskets are secured to the core with metal clinch tabs along both core headers on the front and rear sides of the radiator. The coolant flow through the radiator is from left to right with the radiator inlet near the top of the left end tank and the radiator outlet near the bottom of the right end tank.

Transmission Oil Cooler

An oil-to-coolant transmission oil cooler is located in the right radiator end tank on all vehicles. This is an integral part of the radiator and should not be serviced separately. An additional oil-to-air transmission oil cooler is also used on all vehicles. The air-to-oil cooler is located in front and to the right of the radiator. This oil cooler is replaceable. For information on servicing the air-to-oil transmission oil cooler refer to SECTION 7A.

Engine Oil Cooler

An optional engine oil cooler is located in the left (inlet) end tank of the radiator. Engine oil cooler pipes connect the radiator to the engine block through an adapter, located between the oil filter and engine block. This system circulates the engine oil through the radiator at all times.

Coolant Drain Valve

The coolant drain valve is located at the bottom of the left end tank, facing rearward. The valve is accessible from under the vehicle.

COOLANT RECOVERY RESERVOIR FILLER CAP

A plastic pressure-vent cap is used with the coolant recovery reservoir to allow a build up of 103 kPa (15 psi) in the cooling system. This pressure raises the boiling point of engine coolant to approximately 125° C (257° F) at sea level.

CAUTION: Add coolant to the coolant recovery reservoir only when the system cools.

CAUTION: As long as there is pressure in the cooling system, the temperature can be considerably higher than the boiling temperature of the solution. Removal of the cap while engine is hot and pressure is high will cause the solution to boil instantaneously and possibly with explosive force, spewing the solution over engine, fenders and person removing cap. Under some conditions such as contact with hot engine parts, ethylene glycol coolant can be flammable.

The pressure-type cap contains a blow-off (pressure) valve and a vacuum (atmospheric) valve. The pressure valve is held against its seat by a heavy spring. This spring protects the cooling system by relieving pressure exceeding 103 kPa (15 psi).

To prevent the radiator, coolant recovery reservoir or hoses from collapsing caused by vacuum as the engine cools, the vacuum valve opens as the cooling system pressure drops below atmospheric pressure. As the valve opens, air is drawn into the coolant recovery reservoir equalizing the system pressure with the atmosphere.

To safely remove the cap from a cool system, rotate the cap slowly counterclockwise 1/4 turn and then stop. Allow any pressure to relieve. After all hissing stops, continue to rotate counterclockwise until the cap is removed. There is no specific orientation of the lettering on the cap versus the cap being tight. To re-tighten cap, use approximately 5 N·m (44 lb. in.) of force (hand-tighten).

COOLANT RECOVERY RESERVOIR

A "see through" plastic reservoir is connected to the cooling system at two points: 1) tee connection on inlet heater hose; and 2) throttle body heater outlet. Pressurized coolant will circulate through the reservoir from the throttle body heater outlet to the heater inlet tee connection. The reservoir is at the highest point of the cooling system. This will allow any air or vapor exceeding the pressure cap rating to exit the reservoir. When the coolant is "cold" the level should be at the "FULL COLD" line on the reservoir. An integral coolant level switch is located in the bottom of the reservoir. This switch is bonded into the reservoir and can not be removed.

ENGINE COOLANT FANS

An electric engine coolant fan aids air flow through the radiator and A/C condenser. The cooling system base version has two electric motor-driven fans mounted on the rear face of the radiator. The right fan is driven by a 150 watt motor and the left fan by a 100 watt motor. The extra-capacity cooling system version (RPO VO3) replaces the left fan motor with a 240 watt motor. The heavy-duty cooling system version (RPO VO8) replaces the right fan with an engine belt-driven fan controlled by a thermostatic fluid clutch and left fan motor with a 240 watt motor.

All electric fan motors are controlled by the powertrain control module (PCM) through relays. The PCM senses the coolant system temperature, vehicle speed and A/C high side pressure status to determine electric cooling fan operation.

FAN BLADE CLUTCH (WITH RPO VO8 HEAVY-DUTY COOLING SYSTEM)

The fan blade is driven by the engine through a silicone fluid drive fan blade clutch. The silicone driving fluid allows enough slippage to limit maximum fan blade rpm. Also, the clutch eliminates overcooling, excessive noise, and power loss at high speeds.

The clutch contains a thermostatic coil which senses the temperature of the air that has been drawn through the radiator by the fan blade. When the temperature of this air is below approximately 66° C (151° F), the clutch limits fan speed to 800 to 1,400 rpm. When the temperature of this air rises above approximately 66° C (151° F), the clutch begins to allow fan speed to increase to a maximum speed of approximately 2,200 rpm. No attempt should be made to disturb the calibration of the clutch because each clutch is calibrated at the time of manufacture. Under certain temperature conditions, there is a lateral movement at the fan blade tip which should not be considered as hub or bearing failure. This condition is a design feature of the clutch which allows up to approximately 6 mm (1/4 inch) lateral movement measured at the fan blade tip.

Testing a clutch by holding the small hub with one hand and rotating the aluminum housing in a clockwise or counterclockwise motion will cause the clutch to freewheel, which is a normal condition when operated in this manner. This should not be considered a test for clutch replacement.

COOLING FAN RELAYS

The engine coolant fans (electric motor-driven) are activated by relays controlled by the powertrain control module (PCM). The PCM uses engine coolant temperature, vehicle speed, and A/C high side pressure status to determine coolant fan operation. Refer to SECTION 8A for cooling fan relay location and diagnosis.

LOW COOLANT LEVEL SWITCH

The low coolant level switch is located in the bottom of the coolant recovery reservoir. When the coolant level becomes low, the switch contacts will close (using a magnetic float) and a warning/indicator lamp in the instrument cluster will be illuminated. Refer to SECTION 8A for low engine coolant warning/indicator lamp diagnosis.

ENGINE COOLANT TEMPERATURE SWITCH

The engine coolant temperature switch activates a warning/indicator lamp in the instrument cluster if the engine temperature exceeds 126° C (250° F). Refer to SECTION 8A for engine coolant temperature switch location and diagnosis.

6B-4 COOLING AND RADIATOR

ENGINE COOLANT TEMPERATURE SENSOR

The engine coolant temperature sensor is located on the lower front section of the water pump. The sensor provides a variable input according to engine coolant temperature to the powertrain control module (PCM). Refer to SECTION 6E3 for engine coolant temperature sensor diagnosis.

ENGINE COOLANT THERMOSTAT

The engine coolant thermostat is located in a housing which is mounted on top of the water pump. The thermostat regulates the coolant flow from the radiator to the water pump. A pellet-type thermostat is used in the engine coolant inlet passage to control the flow of engine coolant to provide fast engine warm-up and to regulate engine temperatures. A wax pellet element in the thermostat expands when heated and contracts when cooled. The pellet element is connected through a piston to a valve. The valve remains closed while the engine coolant is cold, allowing full circulation of engine coolant through engine, throttle body heater and heater core. As the engine warms, the pellet element expands and the thermostat valve opens, permitting full engine coolant flow throughout all components of the cooling system.

THROTTLE BODY HEATER

Engine coolant flow is provided to the throttle body to improve cold weather driveability. Engine coolant is routed from the rear of both cylinder heads to the throttle body and then to the coolant recovery reservoir.

RADIATOR AIR SIDE BAFFLES AND DEFLECTORS

Radiator air side baffles are located on both sides of the radiator to increase air flow through the radiator. Radiator air deflectors are located at the lower sides and at the bottom of the radiator.

FAN BELT (WITH RPO VO8 HEAVY-DUTY COOLING SYSTEM)

An additional belt (fan belt) is used to drive the optional mechanical cooling fan. The driving pulley which is bolted to the crankshaft balancer and the driven pulley is bolted to the fan clutch. A tensioner pulley maintains proper belt tension on the driving and driven pulleys.

CYLINDER BLOCK DRAINS

The engine cylinder block has two threaded drain holes located on either side of the engine block just above the oil pan. Knock sensors are installed in both drain holes. For more information on knock sensors, refer to SECTION 6E3-C5.

MAINTENANCE RECOMMENDATIONS

Regular maintenance of the cooling system will help keep it operating properly. Use the following procedures to check the cooling system at least once a year.

Every five years or 166 000 km (100,000 miles), whichever comes first, the cooling system should be drained and refilled. Refer to "Draining and Refilling Cooling System" in this section.

CHECKING ENGINE COOLANT

CAUTION: To avoid the danger of being burned, do not remove the coolant recovery reservoir cap while the engine and radiator are still hot. Scalding fluid and steam may be blown out under pressure. Check the engine coolant level visually in the "see-through" reservoir. The level should be at or above the "FULL COLD" mark on the tank when the engine is cold. At normal operating temperatures the engine coolant level should be above the "FULL COLD" mark on the tank.

Engine coolant should be added only to the reservoir to raise the level to the appropriate mark. Use a 50/50 mixture of high quality ethylene glycol and water for engine coolant additions.

ENGINE COOLANT CONCENTRATION

The percentage of ethylene glycol in the engine coolant should be checked periodically and when the engine coolant level is adjusted or the system is drained and refilled. This test is done by using a refractometer engine coolant tester. Refractometers test for the amount of glycol in a coolant mixture by measuring the speed of light as it passes through the fluid and are not affected by the specific gravity of the glycol. Refer to "Testing the Coolant Concentration" in this section.

HOSES AND CLAMPS INSPECTION

Inspect the condition of all hoses and clamps. Hoses should be flexible and show no signs of bulging, cracks, cuts, kinks or area of possible leaks. Inspect the brackets, supports, ties and clamps. Adjust and tighten as necessary.

PRESSURE TESTING

Test the reservoir filler cap for the proper pressure holding capacity. Refer to "Coolant Recovery Reservoir Filler Cap Pressure Test" in this section. For cooling system pressure testing, refer to "On-Vehicle Cooling System Pressure Testing" in this section.

EXTERIOR RADIATOR CLEANING

Clearing away bugs, leaves and other debris from the small air passageways of the radiator will improve the operation of the cooling system. Use compressed air to blow through the radiator from the rear towards the front of the vehicle. If compressed air is not available, water can be used by directing the water hose from the rear of the radiator.

CAUTION: Never spray water on hot radiator. The resulting steam could cause personal injury.

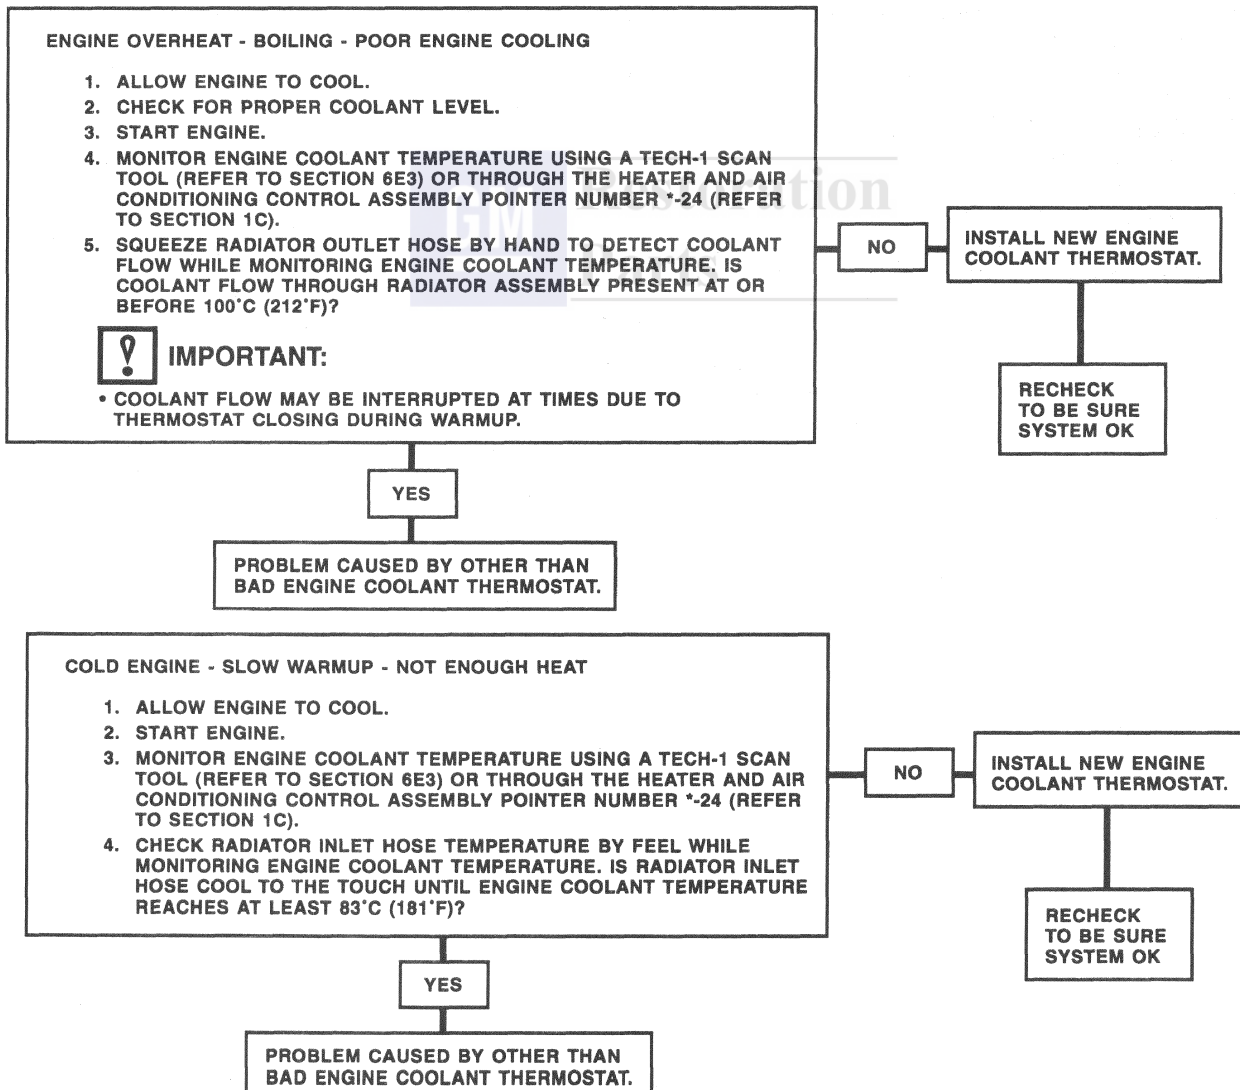

NOTICE: The radiator fins are necessary for good heat transfer and should not be brushed. Brushing may damage the fins, reducing heat transfer.

DIAGNOSIS

COOLING SYSTEM OVERHEATING

1. If overheating occurs due to prolonged idling in gear, instruct operator on driving techniques which would reduce the possibility of engine overheating:
 - Idle in "NEUTRAL" as much as possible and raise engine rpm using accelerator pedal.
2. If above does not apply, refer to diagnosis chart.

ENGINE COOLANT THERMOSTAT DIAGNOSIS

6B-6 COOLING AND RADIATOR

ENGINE COOLANT THERMOSTAT TEST

The thermostat controls coolant flow into the engine (inlet side). As the thermostat opens, cold coolant from the radiator passes through the thermostat causing it to close until the thermostat again reaches normal operating temperature. This slow bleeding of cold coolant into a hot engine helps prevent thermal shock due to the sudden rush of cold coolant. The thermostat will remain open after the entire cooling system has reached normal operating temperature.

Inspect

- Engine coolant thermostat opening temperature. Refer to "Cooling System Overheating" in this section.

FAN BLADE CLUTCH (WITH RPO V08 HEAVY-DUTY COOLING SYSTEM)

1. Fan noise is usually normal if it occurs when clutch is engaged for maximum cooling or during first few minutes after start up.
2. If clutch is locked up due to an internal failure, fan noise or an excessive roar will occur continuously under all high engine speeds (2,500 rpm and up).
3. If fan blade cannot be rotated by hand or if there is a rough grating feel as fan blade is turned, clutch should be replaced.
4. An approximate 6 mm (1/4 inch) maximum lateral movement measured at fan blade tip is allowable. This is not cause for replacement.

5. Small fluid leaks which may occur in area around bearing are not cause for replacement. If leakage appears excessive, proceed to next step.
6. Clutch diagnostic procedure.
 - A. Start with a cool engine to ensure complete clutch disengagement.
 - B. If fan blade and clutch freewheel with no drag (revolve more than five times when spun by hand), clutch should be replaced.

COOLANT RECOVERY RESERVOIR FILLER CAP

Inspect

- Inner sealing surface of coolant recovery reservoir filler tube neck for damage or debris.
- Cap for damage or debris.

COOLANT RECOVERY RESERVOIR FILLER CAP PRESSURE TEST

Tools Required:

J 24460-01 Cooling System Tester

J 24460-92 Cooling System Adapter Set

1. Clean coolant recovery reservoir filler cap.
2. Install cap on male threaded adapter J 24460-194 (part of J 24460-92).
3. Attach adapter J 24460-194 to J 24460-01.
4. Pump pressure tester slowly to obtain minimum holding pressure.
 - A. If cap fails to hold 97 kPa (14 psi), replace cap.
 - B. If installing a new cap, coat cap gasket with engine coolant.

COOLING SYSTEM DIAGNOSIS

<u>CONDITION</u>	<u>POSSIBLE CAUSE</u>	<u>CORRECTION</u>
Engine overheats.	a. Loss of engine coolant. b. Loss of system pressure. c. Weak engine coolant solution. d. Loose fan belt (RPO V08 heavy duty cooling systems only). e. Obstructed radiator fins. f. Cooling system passages blocked by rust or scale. g. Water pump drive shaft broken or splines slipping. h. Kinked coolant recovery reservoir hose. i. Inoperative mechanical fan blade (RPO V08 heavy duty cooling systems only). j. Inoperative electric engine coolant fan. k. Electric engine coolant fan operating in reverse, forcing hot air from engine compartment through radiator. l. Loose, damaged, and/or missing radiator fan upper and lower shrouds, radiator air side and lower deflectors or radiator air side baffles. m. Engine coolant thermostat stuck in the closed position. n. Faulty water pump. o. Incorrect radiator. p. Incorrect or damaged fan blade/engine coolant fan. q. Exhaust system restriction (catalytic converter plugged). r. Engine oil overfill.	a. Pressure test engine cooling system. b. Perform coolant recovery reservoir filler cap pressure test. c. Test engine coolant for proper 50-50 mixture. d. Check fan belt tension. e. Remove or relocate added-on parts that block air to radiator. Clean away bugs, leaves, and other debris. f. Remove radiator. Clean or replace as necessary. Remove cylinder head and inspect, if required. g. Replace drive shaft and/or water pump. h. Re-route coolant recovery reservoir hose. i. Replace fan blade clutch. j. Refer to SECTION 6E3. k. Reverse polarity at electric engine coolant fan motor connector terminals. l. Repair or replace as required. m. Replace engine coolant thermostat. n. Replace water pump. o. Determine proper radiator for vehicle and replace radiator if necessary. p. Check for correct part number. Replace fan blade (with RPO V08 heavy duty cooling system) or engine coolant fan if required. q. Refer to SECTION 6F. r. Check engine oil level.
Loss of engine coolant.	Cooling system leaking (external or internal).	Pressure test cooling system. Refer to "On Vehicle Cooling System Pressure Testing" in this section.
Engine fails to reach normal operating temperature. Cool air from the heater.	a. Engine coolant thermostat stuck open or wrong type of engine coolant thermostat. b. Engine coolant is below the "FULL COLD" mark.	a. Install new engine coolant thermostat with correct part number. b. Add engine coolant.
Low coolant light "ON" (reservoir level correct).	Faulty low coolant sensor or circuit.	Refer to SECTION 8A.

6B-8 COOLING AND RADIATOR

SERPENTINE DRIVE BELT

Routine inspection of the serpentine drive belt may reveal cracks in the belt ribs. These cracks will not impair belt performance and are not a basis for belt replacement. For belt tensioning and replacement procedures, refer to SECTION 6A4A.

ON-VEHICLE SERVICE

DRAINING AND REFILLING COOLING SYSTEM

Figure 1

Every five years or 166 000 km (100,000 miles) whichever first occurs, the cooling system should be drained and filled using the following recommended procedures:

CAUTION: To avoid the danger of being burned, do not remove the coolant recovery reservoir filler cap while the engine and radiator are still hot. Scalding fluid and steam may be blown out under pressure.

1. Park vehicle on level surface.
2. Remove coolant recovery reservoir filler cap.
 - A. Slowly rotate cap counterclockwise about 1/4 turn and then stop.
 - B. Wait until any remaining pressure (indicated by a hissing sound) is relieved.
 - C. After all hissing ceases, continue to rotate cap counterclockwise until cap is removed.
3. Open coolant drain valve located in left-hand radiator end tank.

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

4. Disconnect battery negative cable.
5. Open heater air bleed valve (36) located just above water pump on the thermostat housing.
 - Place a shop towel under the bleed valve to prevent coolant from splashing onto distributor.
6. Remove both electronic spark control (ESC) knock sensors located on both sides of engine block.
7. Allow system to drain completely.

Important

- Store used coolant in a proper fashion, i.e., in a used coolant holding tank. NEVER POUR USED COOLANT DOWN THE DRAIN! Ethylene Glycol antifreeze is a very toxic chemical; disposing of it into the sewer system or ground water is both illegal and ecologically unsound!

8. Close coolant drain valve.

9. Install ESC knock sensors.

NOTICE: Use Ethylene Glycol antifreeze meeting GM specification 6277M (silicate free) to provide required freezing and corrosion protection at least 50-percent solution, -37° C (-34° F).

10. Fill cooling system through the coolant recovery reservoir to the "FULL COLD" mark.
11. Close heater air bleed valve (36) when bubbles disappear and only coolant is visible.
12. Connect battery negative cable.

Tighten

- Bolt/screw to 6 N·m (53 lb. in.).

Important

- Block wheels, place transmission in "PARK" or "NEUTRAL" and set parking brake.

Figure 1- Heater Air Bleed Valve

02-22-95
BS0026B

13. Run engine with the coolant recovery reservoir filler cap off until thermostat opens.
14. Open heater air bleed valve (36). When bubbles disappear and only coolant is visible, close heater air bleed valve (36).
 - Place a shop towel under the bleed valve to prevent coolant from splashing onto distributor.

CAUTION: Under some conditions, Ethylene Glycol in engine coolant is flammable. To avoid being burned when adding engine coolant, do not spill it on the exhaust system or on hot engine parts.

15. Fill cooling system through the coolant recovery reservoir until the coolant level is approximately 25 mm (1 inch) above the "FULL COLD" mark.

NOTICE: Use Ethylene Glycol antifreeze meeting GM specification 6277M (low silicate) to provide required freezing and corrosion protection - at least 50-percent solution, -37° C (-34° F).

! Important

- When refilling the engine cooling system, add two engine coolant supplement sealant pellets (GM P/N 3634621 or equivalent) and coolant antifreeze meeting GM specification 6277M.
16. Install the coolant recovery reservoir filler cap.

🔍 Inspect

- For leaks, after running engine until normal operating temperature is reached.

NOTICE: "LOW COOLANT" warning/indicator lamp may come on after this procedure. After operating vehicle so engine heats up and cools down three times, if "LOW COOLANT" warning/indicator lamp does not go out, or fails to come on at ignition check and coolant is above "FULL COLD" mark in reservoir, refer to SECTION 8A. If at any time the "HOT" warning/indicator lamp comes on, immediate action is required. Turn off engine and allow vehicle to cool. Do not remove coolant recovery reservoir cap at this time.

17. Test coolant concentration. Refer to "Testing the Coolant Concentration" in this section.

TESTING THE COOLANT CONCENTRATION

Figures 2 through 4

Tools Required:
J 23688-A or J 26568-A Coolant Tester

! Important

- Both J 23688-A and J 26568-A automatically compensate for temperature.

- Make sure eyepiece of J 23688-A or J 26568-A is totally free of solution before looking through it. Refer to Figure 2.
 - Before each use, swing plastic cover at slanted end of J 26568-A or J 23688-A exposing measuring window and bottom of plastic cover.
 - Wipe dry both prism and bottom of sample cover with tissue or clean soft cloth.
 - Close plastic cover.
1. Release tip of pump from J 23688-A or J 26568-A housing.
 - Do not remove clear plastic pump from J 23688-A or J 26568-A.

CAUTION: To avoid being burned, DO NOT remove coolant recovery reservoir cap while engine is at normal operating temperature. The cooling system will release scalding fluid and steam under pressure if cap is removed while engine and radiator are still hot. This could result in a large coolant loss and possible personal injury.

2. Remove coolant recovery reservoir cap.
3. Insert tube into coolant recovery reservoir.
 - Make sure tube is below level of coolant.
4. Press and release bulb to get sample of coolant.
5. Bend tube around J 23688-A or J 26568-A so that tip can be inserted in cover plate opening.
6. Press bulb and allow a few drops to fall onto measuring surface.

Figure 2 - Cleaning the Coolant Tester

Figure 3 - Collecting the Coolant

6B-10 COOLING AND RADIATOR

- Do not open plastic cover when taking readings because water evaporation can change readings.
7. Point J 23688-A or J 26568-A toward any light source and look into eyepiece.
 - Coolant protection reading is at point where dividing line between light and dark crosses scale on right.
 - Temperature scale is reversed from a standard thermometer scale. Below zero readings are on upper half of scale.
 - If readings are not clear, the measuring prism was not cleaned and dried or there was not enough fluid on measuring prism.

CALIBRATING TESTERS

J 23688-A and J 26568-A are factory calibrated and sealed and should not require adjustment. If adjustment is required, follow instructions below.

1. Make sure J 23688-A and J 26568-A is between 21° C and 29° C (70° F and 85° F).
2. Using distilled water, take a reading. If reading departs from a 0° C (32° F) reading on scale, a correction can be made by adjusting screw on bottom of J 23688-A and J 26568-A.
3. Remove sealant covering screw.

Important

- Do not remove screw from J 23688-A and J 26568-A.
4. Turn screw in direction necessary to adjust reading to 0° C (32° F) line.
 5. Reseal the screw using a silicone sealant.

ENGINE COOLANT FLUSHING AND RECYCLING

Engine Coolant Flushing

Tool Required:

Non-Aqueous Coolant Exchanger such as ProFill J 75010-KM (Available in the GM Dealer Equipment program)

Figure 4 - Reading the Coolant Tester

If your state/local environmental enforcement group does not allow the discharge of coolant or if you do not desire to put used coolant into the environment there are various methods and equipment that can be used to flush the coolant system. If using special equipment such as a back flusher, follow the manufacturer's instructions. However, the thermostat should be removed before flushing the system.

Engine Coolant Recycling

Tool Required:

GM approved Recycling System such as Pro Clean (Available in the GM Dealer Equipment program)

As the need arises to conduct cooling system maintenance or repairs, all of the used coolant must be removed and replaced with qualified new or recycled coolant. If only the radiator is drained, up to 50 percent of the used, contaminated coolant can remain in the cooling system. Removing used coolant (from the vehicle) can be accomplished by several methods:

- Utilize waterless coolant evacuation system available in the GM Dealer Equipment program (or equivalent) which removes the used coolant and replaces it with approved new or recycled coolant.
- Utilize a GM approved coolant recycling system available in the GM Dealer Equipment program (or equivalent) which recycles the coolant on the vehicle thereby eliminating the need for evacuation.
- Recover used coolant and store in a used coolant holding tank and submit the used coolant for recycling on a regular basis.

RADIATOR LEAK TESTING

Clean the core so the damaged area is easier to find. Some radiator leaks can sometimes be detected without pressurizing the system. After filling the cooling system, inspect the radiator for leaks before proceeding with what may be an unnecessary step of pressurizing the cooling system.

ON-VEHICLE COOLING SYSTEM PRESSURE TESTING

Figure 5

Tools Required:

J 24460-01 Cooling system Tester

J 24460-92 Cooling System Adapter Set

Important

- A very slight amount of weepage may occur at the water pump vent hole during vehicle operation. Tracks of residue may occur from the lower vent hole. The water pump should be replaced only if coolant is dripping from the vent hole while the engine is in operation or while the cooling system is pressurized.

Figure 5 - Pressure Testing the Cooling System

- Minor water pump weepage and minor engine cooling system leaks may be corrected by adding two sealant pellets GM P/N 3634621 to the cooling system. Pellets should be crushed then placed inside coolant recovery reservoir.

1. Ensure that radiator hose clamps and heater hose clamps are properly positioned and secured.
2. Inspect connections for leaks. Repair as required.

CAUTION: To avoid being burned, do not remove coolant recovery reservoir cap while engine is at normal operating temperature. The cooling system will release scalding fluid and steam under pressure if radiator filler cap is removed while engine and radiator are still hot.

3. Remove coolant recovery reservoir cap.
4. Fill cooling system to the "FULL COLD" mark.
5. Attach female threaded adapter J 24460-193 (part of J 24460-92) to coolant recovery reservoir filler neck.
6. Connect system tester, such as J 24460-01 to adapter J 24460-193 already attached to the coolant recovery filler neck.
7. Pump up pressure to no more than 138 kPa (20 psi).
8. System should hold pressure for at least two minutes.
 - A. If a measurable amount of pressure drops in less than two minutes, check for leak.
 - B. Leak may be internal or external. If no visible leak is found, including heater core, engine disassembly may be required. Refer to SECTION 6A4A.

ENGINE COOLANT THERMOSTAT AND HOUSING

Figure 6

↔ Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Air resonator and intake air duct.
3. Open coolant drain valve, located in the left-hand radiator end tank, and drain engine coolant.
4. Close coolant drain valve.
5. Radiator outlet hose and clamp from thermostat housing (14).

Figure 6 - Engine Coolant Thermostat and Housing

6B-12 COOLING AND RADIATOR

6. Bolts/screws (15).
7. Thermostat housing (14).
8. Thermostat (17) and gasket (16).

Clean

- Gasket surfaces of thermostat housing (14) and water pump (55).

Install or Connect

NOTICE: Refer to “Notice” on page 6B-1 of this section.

1. Thermostat (17) and new gasket (16).
2. Thermostat housing (14).
3. Bolts/screws (15).

Tighten

- Bolts/screws (15) to 28 N.m (21 lb. ft.).
4. Radiator outlet hose and clamp to thermostat housing (14).
 5. Air intake duct and air resonator.
 6. Add engine coolant. Refer to “Draining and Refilling Cooling System” in this section.
 7. Battery negative cable.

Tighten

- Bolt/screw to 6 N.m (53 lb. in.).

Inspect

- For leaks before and after running engine.

COOLANT RECOVERY RESERVOIR

Figure 7

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Electrical connector to low coolant switch (located underneath reservoir).
3. Open coolant drain valve (located in left hand radiator end tank).
4. Drain enough coolant to empty reservoir (10) and its hoses.
5. Close coolant drain valve.
6. Coolant recovery reservoir hoses.
 - Throttle body heater to reservoir hose at the reservoir (10).
 - Heater inlet tee to reservoir hose at tee.
7. Nuts (11).
8. Reservoir (10).

Clean

- Reservoir (10) with soap and water. Rinse thoroughly.

Install or Connect

NOTICE: Refer to “Notice” on page 6B-1 of this section.

1. Reservoir (10).
2. Nuts (11).

Figure 7 - Coolant Recovery Reservoir

Tighten

- Nuts (11) to 6 N.m (53 lb. in.).
- 3. Coolant recovery reservoir hoses.
- 4. Electrical connector to low coolant sensor.
- 5. Battery negative cable.
- 6. Refill cooling system. Refer to "Draining and Refilling Cooling System" in this section.

FAN BLADE (WITH RPO VO8 HEAVY-DUTY COOLING SYSTEM)

Figure 8

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Radiator fan upper shroud bolts/screws.
3. Radiator fan upper shroud.
4. Nuts (44).
5. Fan blade (45) with clutch (51).
6. Bolts/screws (52).

NOTICE: Place the clutch in an upright position after removing it. Laying it flat may result in fluid leaking from the clutch.

7. Fan blade (45).

Inspect

- For bent or cracked fan blades.
- Mating surfaces for smoothness. Remove burrs or other imperfections as necessary.

CAUTION: If a fan blade is bent or damaged in any way, no attempt should be made to repair and/or reuse the damaged part. A bent or damaged fan blade should always be replaced with a new fan blade.

CAUTION: It is essential that the fan blade remain in proper balance. Balance cannot be assured once a fan blade has been bent or damaged. A fan blade that is not in proper balance could fail and fly apart during subsequent use, creating an extremely dangerous condition.

Install or Connect

NOTICE: Refer to "Notice" on page 6B-1 of this section.

1. Fan blade (45) to clutch (51).
2. Bolts/screws (52).

6B-14 COOLING AND RADIATOR

Tighten

- Bolts/screws (52) to 24 N.m (18 lb. ft.).
3. Clutch (51) with fan blade (45) to bracket (48).
 4. Nuts (44).

Tighten

- Nuts (44) to 24 N.m (18 lb. ft.).
5. Radiator fan upper shroud.
 6. Radiator fan upper shroud bolts/screws.

Tighten

- Radiator fan upper shroud bolts/screws to 6 N.m (53 lb. in.).
7. Battery negative cable.

FAN BLADE CLUTCH (WITH RPO VO8 HEAVY-DUTY COOLING SYSTEM)

For clutch service procedures, refer to "Fan Blade (with RPO VO8 Heavy-Duty Cooling System)" in this section.

ENGINE COOLANT FAN (ELECTRIC, WITHOUT RPO VO8 HEAVY-DUTY COOLING SYSTEM)

Figure 9

Important

- The base cooling system (without VO3 and VO8) has dual electric fans with a 150-watt fan on the right side and a 100-watt fan on the left side. The VO3 cooling system also has dual electric fans with a 240-watt fan on the left side and a 150-watt fan on the right side. The fans must be installed in their correct location or inadequate cooling may result.

CAUTION: Keep hands, tools, and clothing away from engine coolant fan to help prevent personal injury. This engine coolant fan is electric and can come on whether or not the engine is running. The engine coolant fan can start automatically in response to a temperature sensor with the ignition in the "RUN" position.

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Electrical connectors.
3. Bolts/screws (18 and 19).
4. Fan (20, 21 or 22) from slots in radiator support.

- Note location of each fan.

Install or Connect

NOTICE: Refer to "Notice" on page 6B-1 of this section.

1. Fan (20, 21 or 22) into slots in radiator support.
 - Install at location noted during removal.
2. Bolts/screws (18 and 19).

Tighten

- Bolts/screws (18 and 19) to 6 N.m (53 lb. in.).
3. Electrical connectors.
 4. Battery negative cable.

ENGINE COOLANT FAN (ELECTRIC, WITH RPO VO8 HEAVY-DUTY COOLING SYSTEM)

Figures 9 and 10

CAUTION: Keep hands, tools, and clothing away from engine coolant fan to help prevent personal injury. This engine coolant fan is electric and can come on whether or not the engine is running. The engine coolant fan can start automatically in response to a temperature sensor with the ignition in the "RUN" position.

Figure 9 - Engine Coolant Fans (Electric)

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Air intake duct and resonator.
3. Bolts/screws (25 and 26).
4. Upper shroud (27).
5. Electrical connectors.
6. Bolts/screws (18 and 19).
7. Fan (20) from slot in lower retainer (24).

Install or Connect

NOTICE: Refer to "Notice" on page 6B-1 of this section.

1. Fan (20) into slot in lower retainer (24).
2. Bolts/screws (18 and 19).

Tighten

- Bolts/screws (18 and 19) to 6 N.m (53 lb. in.).
- 3. Electrical connectors.
- 4. Upper shroud (27).
- 5. Bolts/screws (25 and 26).

7. Engine oil cooler inlet and outlet hoses from radiator, if equipped.
8. Coolant recovery reservoir hose from radiator.
9. Bolts/screws (52) and radiator upper mounting panel (53), if vehicle is not equipped with a mechanical fan.
10. Radiator.

Install or Connect

NOTICE: Refer to “Notice” on page 6B-1 of this section.

1. Radiator.
 - Make sure radiator is seated on radiator insulators.
2. Radiator upper mounting panel (53) and bolts/screws (52), if removed.

Tighten

- Bolts/screws (52) to 6 N.m (53 lb. in.).
3. Coolant recovery reservoir hose to radiator.
 4. Transmission oil cooler lower and upper pipes to radiator.

Tighten

- Transmission oil cooler lower and upper pipes to 23 N.m (17 lb. ft.).
5. Engine oil cooler inlet and outlet hoses to radiator, if equipped.

Tighten

- Engine oil cooler inlet and outlet hoses to 24 N.m (18 lb. ft.).
6. Engine cooling fans. Refer to “Engine Cooling Fan” in this section.
 7. Engine coolant hoses to radiator. Refer to “Engine Coolant Hoses” in this section.
 8. Close coolant drain valve.
 9. Battery negative cable.

Tighten

- Bolt/screw to 6 N.m (53 lb. in.).
10. Add engine coolant. Refer to “Draining and Refilling Cooling System” in this section.

Inspect

- For leaks, after running engine until normal operating temperature is reached.

RADIATOR AIR SIDE BAFFLES AND DEFLECTORS

Radiator Air Side Baffle

Figure 12

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Baffle retainers (30) and side baffle retainers (31).
3. Side baffle (29).

Install or Connect

1. Side baffle (29) to radiator support.
2. Side baffle retainers (31).
 - Attach to headlamp bracket.
3. Baffle retainers (30).
 - Attach to condenser.
4. Battery negative cable.

Figure 12 - Radiator Air Side Baffle (Left Hand Shown, Right Side Opposite)

Radiator Air Lower Deflector

Figure 13

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.

5. Lower shroud (28) from radiator support.

Install or Connect

NOTICE: Refer to “Notice” on page 6B-1 of this section.

1. Lower shroud (28) to radiator support.
2. Bolts/screws (25).
3. Upper shroud (27) to lower shroud (28) and radiator support.
4. Bolts/screws (25 and 26).

Tighten

- Bolts/screws (25 and 26) to 6 N.m (53 lb. in.).
5. Battery negative cable.

Tighten

- Bolt/screw to 6 N.m (53 lb. in.).

ENGINE COOLANT HOSES

Figures 10, 11, and 15

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Drain radiator (54) so level of engine coolant is below hose being removed.
3. Air cleaner rear resonator (37).
4. Intake air temperature sensor electrical connector.
5. Loosen clamps on rear intake duct (at engine) and on air cleaner front resonator (39) at mass airflow sensor (57).
6. Rear intake duct and air cleaner front resonator (39) as a unit.
7. Radiator inlet hose (40) at radiator and water pump.
8. Radiator upper mounting panel bolts/screws (52) or radiator fan shroud bolts/screws (25).
9. Radiator upper mounting panel (53) (base cooling system and RPO V03 cooling system) or radiator fan upper shroud (27) (RPO V08 cooling system only).
10. Nuts holding radiator outlet hose bracket to air conditioning compressor studs (RPO V08 cooling system only).
11. Radiator outlet hose (41) at thermostat housing.
12. Coolant recovery reservoir front hose (42) at reservoir and throttle body tube.
13. Coolant recovery reservoir rear hose (43) at reservoir and radiator.

14. Raise and suitably support vehicle. Refer to SECTION 0A.

15. Radiator outlet hose (41) from radiator (54).

Install or Connect

NOTICE: On vehicles equipped with heavy-duty cooling option (RPO V08), do not attempt to replace the specified radiator outlet hose with an ordinary rubber hose. The proper V08 hose contains a metal section to protect it from possible damage by the engine-driven cooling fan blades.

1. Radiator outlet hose (41) at radiator.
2. Lower vehicle.
3. Coolant recovery reservoir rear hose (43) at reservoir and radiator.
4. Coolant recovery reservoir front hose (42) at reservoir and throttle body tube. Make sure front hose is routed underneath rear hose.
5. Radiator outlet hose (41) at thermostat housing.

Important

- Make sure radiator outlet hose (41) is routed underneath coolant recovery reservoir front hose (42).
6. Radiator outlet hose bracket to air conditioner compressor studs (RPO V08 cooling system only).
 7. Air conditioning compressor stud nuts (RPO V08 cooling system only).

Tighten

- Air conditioning compressor stud nuts to 16 N.m (12 lb. ft.).
8. Radiator upper mounting panel (53) (base cooling system and RPO V03 cooling system) or radiator fan upper shroud (27) (RPO V08 cooling system only).
 9. Radiator upper mounting panel bolts/screws (52) or radiator fan shroud bolts/screws (25).
- ### Tighten
- Bolts/screws (52 or 25) to 6 N.m (53 lb. in.).
10. Radiator inlet hose (40) at radiator and water pump.
 11. Rear air intake duct and air cleaner front resonator (39) as a unit.
 12. Tighten clamps snugly on rear air intake duct (at engine) and on air cleaner front resonator (39) at mass airflow sensor (57).
 13. Intake air temperature sensor electrical connector.
 14. Air cleaner rear resonator (37). Insert front part of rear reservoir into top of previously installed rear air intake duct and tighten clamp snugly.
 15. Battery negative cable.

Section 6C

Engine Fuel

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

Notice: Always use the correct fastener in the correct location. When you replace a fastener, use ONLY the exact part number for that application. General Motors

will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, Do Not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The fuel supply is stored in the fuel tank. An electric fuel pump, attached to the fuel sender assembly (inside the fuel tank) pumps fuel through an in-line filter to the fuel rail assembly. The pump is designed to provide fuel at a pressure above the regulated pressure needed by the injectors. A pressure regulator, an integral part of the fuel rail assembly, keeps fuel available to the injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate pipe. For further information on the fuel injection system, go to *Fuel Metering System* located in *Section 6E3-C2*.

Unleaded fuel must be used with all gasoline engines for proper emission control system operation. Using unleaded fuel will also decrease spark plug fouling and extend engine oil life. Leaded fuel can damage the emission control system, and its use can result in loss of emission warranty coverage.

All vehicles with gasoline engines are equipped with an evaporative emission system that minimizes the escape of fuel vapors to the atmosphere. Information on this system is found in *Section 6E3-C3*.

Fuel Tank

The fuel tank is used to store fuel for the vehicle. The tank is molded from high density polyethylene, and is located behind the rear wheels. It is held in place by two metal straps and a cross strap attached to the underbody. The tank shape includes a reservoir to maintain a constant supply of fuel around the fuel pump strainer during low fuel conditions and aggressive vehicle maneuvers.

When working on or near the fuel tank, be sure to observe important information molded on the bottom of tank.

6C-2 Engine Fuel

Fuel Tank Filler Pipe

Figure 1

The fuel tank filler pipe outlet is positioned at the rear of the vehicle. To prevent refueling with leaded fuel, the fuel filler pipe has a built-in restrictor and deflector.

Figure 1 - Fuel Filler Cap (Typical)

Fuel Filler Cap

Figure 1

The fuel tank filler pipe is equipped with a threaded-type cap. The threaded part of the cap requires several turns counterclockwise to remove. A built-in torque-limiting device prevents over tightening. To install, turn the cap clockwise until a clicking noise is heard. This signals that the correct torque has been reached and the cap is fully seated.

Notice: If a fuel filler cap requires replacement, use only a cap with the same features. Failure to use the correct cap can result in a serious malfunction of the system.

Fuel Sender Assembly

Figure 2

The fuel sender assembly is located inside the fuel tank and is attached to the top of the fuel tank. The fuel sender assembly consists of the following major components: a fuel sender, fuel pump, and a fuel pump strainer.

Figure 2 - Fuel Sender Assembly

Fuel Sender

Figures 2 and 3

The fuel sender consists of the float, wire float arm, rheostat and roll-over valve. Fuel level is sensed by the position of the float and float arm which operate the 90 ohm rheostat. As the float position changes, the amount of current passing through the rheostat varies, thus changing the gauge reading on the instrument panel.

The roll-over valve is pressed into the EVAP pipe of the fuel sender and is not serviced separately. The roll-over valve prevents fuel from entering the evaporative emission canister if the vehicle rolls over by shutting "OFF" the EVAP pipe to the canister.

Figure 3 - 90 Ohm Rheostat (Typical)

Fuel Pump

Figure 2

The fuel pump is an electric medium pressure twin turbine pump which is mounted to the fuel sender assembly inside the fuel tank. The fuel is pumped to the fuel rail assembly at a specified flow and pressure by the fuel pump. Excess fuel is returned to the fuel tank by the return pipe. The fuel pump delivers a constant flow of fuel to the engine even during low fuel conditions and aggressive vehicle maneuvers.

The electric fuel pump operation is controlled by the Powertrain Control Module (PCM) through a fuel pump relay. Go to *Section 6E3-C2* and *Section 8A* of this manual for further description and a wiring diagram of the fuel pump relay.

Fuel Pump Strainer

Figure 2

A woven plastic fuel pump strainer is attached to the lower end of the fuel pump in the fuel tank. The functions of the fuel pump strainer are to filter contaminants and to wick fuel.

The life of the fuel pump strainer is generally considered to be that of the fuel pump. The fuel pump strainer is self-cleaning and normally requires no maintenance. Fuel stoppage at this point indicates that the fuel tank contains an abnormal amount of sediment or water. In this case the tank should be thoroughly cleaned. Go to *Fuel System Cleaning* in this section. If the fuel pump strainer is plugged, replace it with a new one.

In-Line Fuel Filter

Figure 4

A steel in-line fuel filter is used in the fuel feed pipe ahead of the fuel injection system. The filter element is made of paper, and is designed to trap particles in the fuel that may damage the injection system. The filter housing is constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. Quick-connect type fittings are used at both ends of the filter. There is no service interval for fuel filter replacement. Only replace the fuel filter if it is restricted.

Figure 4 - In-Line Fuel Filter (Typical)

MA 5050-SY

Fuel Feed and Return Pipes

Nylon Fuel Pipes

Nylon fuel pipes are designed to perform the same job as the steel or flexible fuel pipes or hoses they replace. Nylon pipes are constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. There are two sizes used: 3/8" ID for the fuel feed, and 5/16" ID for the fuel return.

The fuel feed and return pipes are assembled as a harness. Retaining clips hold the pipes together and provide a means for attaching the pipes to the vehicle. Sections of the pipes that are exposed to chafing, high temperature or vibration are protected with heat resistant rubber hose and/or corrugated plastic conduit.

6C-4 Engine Fuel

Nylon fuel pipes are somewhat flexible and can be formed around gradual turns under the vehicle. However, if forced into sharp bends, nylon pipes will kink and restrict fuel flow. Also, once exposed to fuel, nylon pipes may become stiffer and are more likely to kink if bent too far. Some special care should be taken when working on a vehicle with nylon fuel pipes.

CAUTION: To Reduce the Risk of Fire and Personal Injury:

- **Always cover nylon fuel pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115° C (239° F) for more than one hour, or more than 90° C (194° F) for any extended period.**
- **Take care not to nick or scratch the nylon fuel pipes. If damaged, they must be replaced.**

Quick-Connect Fittings

Quick-connect type fittings provide a simplified means of installing and connecting fuel system components. Depending on the vehicle model, there are two types of quick-connect fittings, each used at different locations in

the fuel system. Each type consists of a unique female connector and a compatible male pipe end. O-rings, located inside the female connector, provide the fuel seal. Integral locking tabs or fingers hold the fittings together.

EVAP Pipes and Hoses

The EVAP pipe extends from the fuel sender assembly to the evaporative emission canister. It is made up of nylon pipe and is connected to the fuel sender assembly and the evaporative emission canister with fuel resistant rubber hoses.

CAUTION: To Reduce the Risk of Fire and Personal Injury:

- **Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115° C (239° F) for more than one hour, or more than 90° C (194° F) for any extended period.**
- **Take care not to nick or scratch the nylon vapor pipes. If damaged, they must be replaced.**

Diagnosis

Alcohol-in-Fuel

Alcohol-in-fuel can be detrimental to fuel system components and may cause driveability problems such as hesitation, lack of power, stall, no start, etc.

The problems may be due to fuel system corrosion and subsequent fuel filter plugging, deterioration of rubber components and/or air-fuel mixture leaning.

Various types and concentrations of alcohols are used in commercial fuel. Some alcohols are more detrimental to fuel system components than others. If an excessive amount of alcohol in the fuel is suspected as the cause of a driveability condition, the following procedure may be used to detect the presence of alcohol in the fuel.

Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear. If the sample appears cloudy, or contaminated with water (as indicated by a water layer at the bottom of the sample), this procedure should not be used, and the fuel system should be cleaned. Go to *Fuel System Cleaning* in this section.

1. Using a 100 ml cylinder with 1 ml graduation marks, fill with fuel to the 90 ml mark.
2. Add 10 ml of water to bring the total fluid volume to 100 ml and install a stopper.
3. Shake vigorously for 10 to 15 seconds.
4. Carefully loosen the stopper to release pressure.
5. Close the stopper and shake vigorously again for 10 to 15 seconds.

6. Put the graduated cylinder on a level surface for approximately 5 minutes to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer (which would now contain both alcohol and water) will be greater than 10 ml. For example, if the volume of the lower layer is increased to 15 ml, it will indicate at least 5 percent alcohol in fuel. The actual amount of alcohol may be somewhat greater because this procedure does not extract all of the alcohol from the fuel.

Fuel Tank Leak Check

Important:

- Before attempting "Fuel Tank Leak Check" place a dry chemical (Class B) fire extinguisher near work area.
 - Before removing the fuel tank for a suspected leak, make sure fuel pipes are not leaking onto the tank. Once removed, make sure fuel is not leaking around fuel sender assembly O-ring.
 - This check requires the fuel sender assembly with O-ring to be installed.
1. Disconnect negative battery cable.
 2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
 3. Drain fuel tank. Refer to *Draining Fuel Tank*.
 4. Remove fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
 5. Cap fuel feed pipe, fuel return pipe and EVAP pipe on fuel sender assembly.
 6. Connect a piece of hose to the filler pipe nipple and plug opposite end.

7. Submerge tank in water or apply soap solution to outside of tank.
8. Apply 35 kPa (5 psi) air pressure to the vent hose on the fuel tank.

- Air bubbles appearing from fuel tank indicate a leak. Replace the fuel tank if it is leaking. Refer to *Fuel Tank and Fuel Filler Tube Replacement*.

On-Vehicle Service

Important: Before attempting any "On-Vehicle Service" place a dry chemical (Class B) fire extinguisher near work area.

Fuel System Pressure Relief

Tool Required:

J 34730-1A, Fuel Pressure Gauge

CAUTION:

- *To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing fuel system components.*
 - *After relieving system pressure, a small amount of fuel may be released when servicing fuel pipes or connections. In order to reduce the chance of personal injury, cover fuel pipe fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when disconnect is completed.*
1. Ignition "OFF."
 2. Disconnect negative battery cable to avoid possible fuel discharge if an accidental attempt is made to start the engine.
 3. Loosen fuel filler cap to relieve tank pressure. (Do not tighten until service has been completed.)
 4. Connect J 34730-1A to fuel pressure connection. Wrap a shop towel around fitting while connecting gauge to avoid spillage.
 5. Install bleed hose into an approved container and open valve to bleed system pressure. Fuel connections are now safe for servicing.
 6. Drain any fuel remaining in gauge into an approved container.

Servicing Quick-Connect Fittings

Figure 5

Tools Required:

J 37088-A, tool set, Fuel Line Quick-Connect Separator

Remove or Disconnect

Important:

- Relieve fuel system pressure before servicing any fuel system connection. Refer to *Fuel System Pressure Relief*.

- Slide dust covers from quick-connect fittings, if equipped.
1. Grasp both sides of fitting. Twist female connector 1/4 turn in each direction to loosen any dirt within fitting.

CAUTION: *Safety glasses must be worn when using compressed air, as flying dirt particles may cause eye injury.*

2. Using compressed air, blow dirt out of fitting.

- For plastic (Hand Releasable) Fitting -

3. Squeeze plastic retainer release tabs.
4. Pull connection apart.

-OR-

- For Metal Fitting -

3. Choose correct tool from J 37088-A tool set for size of fitting. Insert tool into female connector, then push inward to release locking tabs.
4. Pull connection apart.

Clean and Inspect

Notice: If it is necessary to remove rust or burrs from fuel pipe: use emery cloth in a radial motion with the pipe end to prevent damage to O-ring sealing surface.

- Using a clean shop towel, wipe off male pipe end.
- Inspect both ends of fitting for dirt and burrs. Clean or replace components/assemblies as required.

Install or Connect

CAUTION: *To Reduce the Risk of Fire and Personal Injury:*

Before connecting fitting, always apply a few drops of clean engine oil to the male pipe end. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

1. Apply a few drops of clean engine oil to the male pipe end.
2. Push both sides of fitting together to cause the retaining tabs/fingers to snap into place.
3. Once installed, pull on both sides of fitting to make sure connection is secure.
4. Reposition dust cover over quick-connect fitting, if equipped.

In-Line Fuel Filter Replacement

Figure 6

Important:

- There is no service interval for fuel filter replacement. Only replace the fuel filter if it is restricted.
- If the in-line fuel filter is restricted, the fuel tank should be inspected internally and cleaned if necessary.

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Raise vehicle.
4. Fuel filter bracket attaching bolt.
5. Quick-connect fittings. Refer to *Servicing Quick-Connect Fittings*.
6. Fuel filter.

Figure 6 - In-Line Fuel Filter Replacement

Install or Connect

1. Remove protective caps from new filter.
2. New plastic connector retainers on filter inlet and outlet tubes.
 - Install in same positions as on old filter noting direction of fuel flow arrow.
3. Quick-connect fittings. Refer to *Servicing Quick-Connect Fittings*.
4. Trap in-line fuel filter over return pipe and install to frame with attaching bolt. Tighten
 - In-line fuel filter attaching bolt to 10 N•m (89 lb. in.).

5. Lower vehicle.
6. Tighten fuel filler cap.
7. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

Draining Fuel Tank

CAUTION:

- **Never drain or store fuel in an open container due to the possibility of fire or explosion.**
- **When draining fuel tank, slowly insert and do not force hand operated pump device in fuel tank. Forcing pump device can cause fuel pump to be dislocated from fuel sender assembly.**
- Use a hand operated pump device to drain fuel through the fuel filler pipe. Remove fuel and install fuel filler cap.

Fuel Tank and Fuel Filler Pipe Replacement

Figures 7 through 9

CAUTION: To help avoid personal injury when a vehicle is on a hoist, provide additional support for the vehicle on the opposite end from which components are being removed. This will reduce the possibility of the vehicle falling off the hoist.

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Drain fuel tank. Refer to *Draining Fuel Tank*.
4. Raise vehicle.
5. Lower fuel tank shield attaching screws and lower fuel tank shields from upper fuel tank shield.
6. Wipe EVAP hose connection at fuel sender, and then disconnect EVAP hose and clamp.
7. Wipe vent hose connection at fuel filler pipe vent pipe, and then disconnect vent hose and clamp.
8. Wipe fuel filler pipe connection at fuel tank, and then disconnect fuel filler pipe and clamp.

Notice:

- If nylon fuel feed or return pipes becomes kinked, and cannot be straightened, they must be replaced.
- Do Not attempt to repair sections of nylon fuel pipes. If damaged, replace.
- 9. Fuel feed and return pipe quick-connect fittings at fuel sender assembly. Refer to *Servicing Quick-Connect Fittings*.

6C-10 Engine Fuel

10. Fuel sender assembly electrical connector.

Notice: Do Not bend fuel tank retaining straps, as this may damage straps.

11. With the aid of an assistant, support fuel tank and remove front fuel tank retaining strap attaching bolts and fuel tank.

- Place fuel tank in a suitable work area.

Important: Perform Step 12 only if fuel filler pipe needs to be replaced.

12. Fuel filler pipe attaching screws, ground strap (if equipped), and fuel filler pipe.

Disassemble

1. Fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.
2. Fuel tank vent hose.

Assemble

1. Fuel tank vent hose.
2. Install fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.

Install or Connect

Important: Perform Step 1 only if fuel filler pipe needs to be installed.

1. Fuel filler pipe, ground strap (if equipped), and fuel filler pipe attaching screws.
Tighten
 - Fuel filler pipe attaching screws to 6 N•m (53 lb. in.) (Except Wagon) and 1.9 N•m (17 lb. in.) (Wagon).
 - Fuel filler pipe ground strap screw to 4 N•m (35 lb. in.).
2. With the aid of an assistant, position and support fuel tank. Install fuel tank retaining strap front attaching bolts.
Tighten
 - Front fuel tank retaining strap bolts to 32 N•m (24 lb. ft.).
3. Fuel filler pipe and clamp.

4. Fuel tank vent hose and clamp.

5. EVAP hose and clamp.

6. Fuel sender assembly electrical connector.

7. Fuel feed and return pipe quick-connect fittings to fuel sender assembly. Refer to *Servicing Quick-Connect Fittings*.

8. Lower fuel tank shields on upper fuel tank shield with attaching screws.

Tighten

- Lower fuel tank shield attaching screws to 1 N•m (9 lb. in.).

9. Lower vehicle.

10. Add fuel and install fuel filler cap.

11. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

Fuel Sender Assembly Replacement

Figures 9 and 10

Important: Always replace fuel sender assembly O-ring when reinstalling fuel sender assembly.

Notice: Do Not handle the fuel sender assembly by the fuel sender pipes. Due to the length of the pipes, the amount of leverage generated by handling the pipes could damage the solder joints.

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Drain fuel tank. Refer to *Draining Fuel Tank*.
4. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
5. Fuel sender assembly attaching nuts, retaining flange, fuel sender assembly and O-ring from fuel tank. Discard O-ring.

Clean

- Fuel sender assembly sealing surfaces.

Figure 9 - Fuel Sender Assembly Replacement

MS 8912-6C

Install or Connect

Important: Care should be taken not to fold over or twist the fuel pump strainer when installing the fuel sender assembly as this will restrict fuel flow. Also, assure that the fuel pump strainer does not block full travel of float arm.

1. Position new O-ring on fuel tank.
2. Fuel sender assembly, retaining flange and fuel sender assembly attaching nuts.
Tighten
 - Fuel sender assembly attaching nuts to 3 N•m (27 lb. in.).

3. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
4. Add fuel and install fuel filler cap.
5. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

Fuel Sender Assembly Service

Figures 9 and 10

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Drain fuel tank. Refer to *Draining Fuel Tank*.
4. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
5. Fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.

Disassemble

1. Note position of fuel strainer on fuel pump.
2. Support sender with one hand and grasp strainer with other hand.
 - Rotate strainer in one direction and pull off of pump. Discard strainer after inspection.

Inspect

- Fuel pump strainer. If strainer is contaminated, it must be replaced and the fuel tank should be cleaned.
- Fuel pump inlet for dirt and debris. If found, fuel pump should be replaced.

- If fuel pump is being replaced, proceed to Step 3. -

3. Loosen clamp and remove fuel feed hose from fuel pump outlet.
4. Terminal retainer.
5. Fuel pump electrical connector and electrical connector from bottom of sender cover.
6. Retainer clip from fuel return pipe.
7. Fuel pump and fuel level sensor assembly and spring from fuel sender.
8. Housing cover from fuel pump housing.
9. Fuel pump.

Notice: Do Not run fuel pump unless submerged in fuel.

- If fuel level sensor is being replaced, proceed to Step 10. -

10. Slide fuel level sensor from retainers on fuel pump housing.

Figure 10 - Fuel Sender Assembly Disassembly (Typical)

Assemble

1. Fuel level sensor to fuel pump housing.
2. Fuel pump and isolator into fuel pump housing.

Important: Small hole in the housing cover aligns over the fuel level sensor.

3. Housing cover to fuel pump housing.
4. Slide fuel pump and fuel level sensor assembly and spring onto fuel return pipe.

Important: Fuel pump and fuel level sensor assembly must be aligned directly under fuel sender cover.

5. Compress spring and install retainer clip through fuel return pipe.
6. Fuel feed hose to fuel pump outlet.
 - Tighten clamps so that 5 to 8 teeth are engaged.

7. Fuel pump electrical connector and electrical connector to bottom of sender cover.
8. Terminal retainer.

Important: Always install a new pump strainer when replacing fuel pump.

9. New pump strainer in same position as noted during disassembly.
 - Push on outer edge of strainer ferrule until fully seated.

Install or Connect

1. Fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.
2. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
3. Add fuel and install fuel filler cap.
4. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

Fuel System Cleaning

Important:

- Only use oil free compressed air to blow out fuel pipes.
- If the in-line fuel filter is plugged, the fuel tank should be inspected internally and cleaned if necessary.

Fuel Tank

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Drain fuel tank. Refer to *Draining Fuel Tank*.
4. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
5. Fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.

Inspect

- Whenever the fuel tank is cleaned, the fuel pump strainer must be inspected. If strainer is contaminated, it must be replaced and the fuel pump must be inspected.
- Fuel pump inlet for dirt and debris. If found, fuel pump should be replaced.
- 6. Flush fuel tank with hot water.

Important: When flushing fuel tank, the fuel and water mixture needs to be treated as a hazardous material. The material needs to be handled in accordance with all applicable local, state, and federal laws and regulations.

7. Pour water out of fuel sender assembly opening.
 - Rock tank to be sure that removal of water from tank is complete.

Install or Connect

1. Fuel sender assembly. Refer to *Fuel Sender Assembly Replacement*.
2. Fuel tank. Refer to *Fuel Tank and Fuel Filler Pipe Replacement*.
3. Add fuel and install fuel filler cap.
4. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

Fuel Feed and Return Pipes Replacement

Figures 6 and 11

Tools Required:

J 37088-A, tool set, Fuel Line Quick-Connect Separator

Notice:

- If nylon fuel feed or return pipes becomes kinked, and cannot be straightened, they must be replaced.
- Do Not attempt to repair sections of nylon fuel pipes. If damaged, replace.

Remove or Disconnect

1. Negative battery cable.
2. Relieve fuel system pressure. Refer to *Fuel System Pressure Relief*.
3. Quick-connect fittings at fuel rail in engine compartment. Refer to *Servicing Quick-Connect Fittings*.
4. Fuel feed and return pipe retaining clip at brake booster.
5. Raise vehicle.
6. Quick-connect fittings at fuel filter. Refer to *Servicing Quick-Connect Fittings*.
7. Lower fuel tank shield attaching screws and lower fuel tank shields.
8. Fuel feed, return, and EVAP pipe underbody retainer.
9. Quick-connect fittings at fuel sender assembly. Refer to *Servicing Quick-Connect Fittings*.
10. Fuel feed and return pipe retaining clips and fuel feed and return pipes.
 - Note position of fuel pipes for installation.

Install or Connect

CAUTION: To Reduce the Risk of Fire and Personal Injury:

- **If nylon fuel pipes are nicked, scratched or damaged during installation, they must be replaced.**
- **When installing new fuel pipes, Do Not hammer directly on the fuel harness body clips as this may damage the nylon pipes resulting in a possible fuel leak.**

1. Lower vehicle.
2. Rear ends of fuel feed and return pipes into top forward frame hole.
3. Raise vehicle.
4. Route pipes in same position as noted during disassembly.
5. Quick-connect fittings at fuel sender assembly. Refer to *Servicing Quick-Connect Fittings*.
6. Fuel feed, return, and EVAP pipe underbody retainer.

Figure 11 - Fuel Feed and Return Pipes Replacement (Typical)

7. Lower fuel tank shields and tank shield attaching screws.
Tighten
 - Lower fuel tank shield screws to 1 N•m (9 lb. in.).
8. Quick-connect fittings at fuel filter. Refer to *Servicing Quick-Connect Fittings*.
9. Close all retaining clips.
10. Lower vehicle.
11. Fuel feed and return pipe retaining clip at brake booster.
12. Quick-connect fittings at fuel rail in engine compartment. Refer to *Servicing Quick-Connect Fittings*.
13. Negative battery cable.

Inspect

- Turn ignition switch to "ON" position for two seconds, then turn to "OFF" for ten seconds. Again turn to "ON" position and check for fuel leaks.

EVAP Pipe Replacement

Figure 12

Notice:

- If nylon pipes becomes kinked, and cannot be straightened, they must be replaced.
- Do Not attempt to repair sections of nylon pipes. If damaged, replace.
- When replacing EVAP pipes, always replace them with original equipment or parts that meet the GM specifications for those parts.
- When replacing EVAP hoses always replace them with original equipment or parts meeting GM specifications, use only reinforced fuel-resistant hose which is identified with the word "Fluoroelastomer" or "GM 6163-M" on the hose.

Figure 12 - EVAP Pipe Replacement (Typical)

6C-16 Engine Fuel

Remove or Disconnect

1. Raise vehicle.
2. Fuel feed, return, and EVAP pipe underbody retainer.
3. EVAP pipe clamp at fuel sender assembly.
4. EVAP pipe retaining clips.
 - Note position of EVAP pipe for installation.
5. Lower vehicle.
6. EVAP pipe hose end clamp at EVAP canister.
7. Forward pipe assembly retaining clips.

Install or Connect

1. Insert rear end of EVAP pipe into top forward frame hole. Load until formed pipe/conduit reaches into hole.
2. Forward pipe assembly retaining clips.
3. EVAP pipe hose end to EVAP canister. Secure with clamp.
4. Raise vehicle.
5. Position new EVAP pipe in same position as noted during disassembly and install retaining clips.
6. EVAP pipe clamp at fuel sender assembly.
7. Fuel feed, return, and EVAP pipe underbody retainer.
8. Lower vehicle.

Specifications

Torque Specifications

Application	Nm	Lb Ft	Lb In
Front Fuel Tank Retaining Strap Bolts	32	24	—
Fuel Filler Pipe Attaching Screws (Except Wagon)	6	—	53
Fuel Filler Pipe Attaching Screws (Wagon)	1.9	—	17
Fuel Filler Pipe Ground Strap Screw	4	—	35
Fuel Sender Assembly Attaching Nuts	3	—	27
Fuel Tank Cross Strap Attaching Nut	15	11	—
In-Line Fuel Filter Attaching Bolt	10	—	89

Fuel Specifications

The fuel must meet ASTM Standard: D4814 (U.S.), CGSB 3.5-92 (Canada).

Octane Requirements

5.7L (VIN P)

4.3L (VIN W)

Minimum Octane Recommended: $87[(R+M)/2]$ (pump) octane where R= research octane number, and M= motor octane number.

Gasoline with Alcohol

Notice: Do Not spill fuel containing alcohol on the vehicle. Alcohol can cause damage to the paint finish and trim.

Methyl Tertiary-Butyl Ether (MTBE)

Fuel containing Methyl Tertiary-Butyl Ether (MTBE) may be used, providing there is no more than 15 percent MTBE by volume.

Ethanol

Fuel containing ethanol (ethyl) or grain alcohol may be used, providing that there is no more than 10 percent ethanol alcohol by volume.

Methanol

Fuel containing methanol (methyl) or wood alcohol may be used, providing that there is no more than 5 percent methanol by volume.

Notice: Do not use fuel that contains more than 5 percent methanol. Use of a fuel (gasohol) that contains more than 5 percent of methanol can corrode metal fuel system components and damage plastic and rubber parts.

Special Tools

Figure 13 - Special Tools

Restoration
Parts

SECTION 6D1

BATTERY

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

CAUTION: All batteries generate hydrogen gas which is extremely flammable. If ignited by a spark or flame, the gas may explode violently, causing spraying of acid, fragmentation of the battery and possible severe personal injuries. Wear approved eye protection. Battery fluid is corrosive acid. Flush any contacted area with water immediately and thoroughly.

GENERAL DESCRIPTION

BATTERY

Figures 1 and 2

The maintenance-free battery is standard on all vehicles. See "SPECIFICATIONS" in this section for battery usage applications. There are no vent plugs in the cover. The battery is completely sealed except for

two small vent holes in the sides. These vent holes allow the small amount of gas produced in the battery to escape.

The battery has three major functions in the electrical system: first, it provides a source of energy for cranking the engine; second, it acts as a voltage stabilizer for the electrical system; and third, it provides energy for a limited time when the electrical load exceeds the output of the generator.

6D1-2 BATTERY

Figure 1 - Maintenance-Free Battery

Figure 2 - Battery Label

The battery specification label contains important information for servicing the battery. This information includes test ratings and both original equipment and recommended replacement part numbers. Refer to "Specifications" at the end of this section.

BATTERY RATINGS

A battery has two ratings: (1) a reserve capacity rating and (2) a cold cranking amperage rating at -18°C (0°F). When replacing the battery, use these two ratings as a guide in selecting a replacement. For the catalog number of a replacement battery with ratings similar to the original battery, refer to "Specifications" at the end of this section.

Reserve Capacity

The "Reserve Capacity" is an estimate of the maximum length of time it is possible to travel at night (headlights "ON") with minimum electrical load and no generator output.

Expressed in minutes, it is the approximate time the fully-charged battery can support a 25-amp load without the battery terminal voltage dropping below 10.5 volts at 27°C (80°F).

Cold Cranking Amps

The cold cranking amperage (CCA) test is expressed at a battery temperature of -18°C (0°F). The current rating is the minimum amperage which must be maintained by the battery for 30 seconds, at the specified temperature, while meeting a minimum voltage requirement of 7.2 volts. This rating is a measure of cold cranking capacity.

COMMON CAUSES OF FAILURE

The battery is not designed to last indefinitely; however, with proper care, it will provide many years of service. If the battery tests "good," but fails to perform satisfactorily in service for no apparent reason, the following are some of the more important factors that may point to the cause of trouble:

1. Vehicle accessories are left on overnight.
2. Slow average driving speeds for short periods.
3. The vehicle's electrical load being more than the generator output, particularly with the addition of aftermarket equipment.
4. Conditions in the charging system such as electrical shorts, slipping serpentine belt, faulty generator, or generator voltage regulator.
5. Battery abuse, including failure to keep the battery terminals clean and tight, or loose battery hold-down. See "Battery Replacement" in this section for torque specifications.
6. Mechanical conditions in the electrical system, such as shorted or pinched wires.
7. Extended storage of vehicles.
8. Extended cranking periods due to plug fouling.
9. Incorrect interpretation of the hydrometer.
10. Insufficient ampere-hour charge rate for a discharged battery.
11. Burned out charge/generator lamp bulb causing "No Charge" condition.
12. Continuous current draw on the battery through excessive parasitic drain.

ELECTROLYTE FREEZING

The freezing point of electrolyte depends on its specific gravity. Since freezing may ruin a battery, it should be protected against freezing by keeping it in a charged condition. As long as the green dot is visible in the hydrometer, the freezing point of the battery will be somewhere below -32°C (-25°F). The higher the state of charge, the lower the freezing point. A fully charged battery will not freeze until the temperature gets below -65°C (-85°F).

BATTERY TRAY AND HOLD-DOWN RETAINER

The battery tray and hold-down retainer should be clean and free from corrosion before installing the battery. The battery tray should be in a sound condition so that it will hold the battery securely and keep it level. Make certain there are no parts in the battery tray before installing battery. To prevent the battery from shaking in its battery tray, the hold-down retainers should be tight, but not overtight.

BATTERY PROTECTION DURING VEHICLE STORAGE

Today's vehicles have many high technology electronic devices which result in very small but continuous current drains on the batteries, commonly referred to as "parasitic loads." Vehicles that are not used for an extended period of time may develop an extremely discharged and/or permanently damaged battery resulting from parasitic loads.

Any battery discharged by parasitic loading and then allowed to stand in this condition for a period of time may not readily accept recharge. However, if properly recharged, most batteries will return to a good usable condition.

An extremely discharged battery can freeze at temperatures as high as -7°C (20°F) causing permanent damage. Permanent damage to a discharged battery can also be accelerated by high temperatures.

To prevent this condition, the battery negative cable should be disconnected on vehicles which are not going to be in service within a 30-day period, beginning from the time the vehicle is shipped. If this is not possible, batteries should be recharged periodically (every 20-45 days) until the green dot of the built-in hydrometer is visible.

BUILT-IN HYDROMETER

Figure 3

The maintenance-free battery has a built-in temperature compensated hydrometer in the top of the battery. This hydrometer is used with the following diagnostic procedure. When observing the hydrometer, make sure that the battery has a clean top. A light may be required in some poorly-lit areas. Tap the hydrometer lightly on top to dislodge any air bubbles that might cause a false indication. Under normal operation, two indications can be observed.

1. GREEN DOT VISIBLE

- Any green appearance is interpreted as a "green dot" and the battery is ready for testing.

2. DARK; GREEN DOT NOT VISIBLE

- If there is a cranking complaint, the battery should be tested as described in the "Diagnosis" in this section. The charging and electrical systems should also be checked at this time.

- Occasionally, a third condition may appear:

3. CLEAR OR LIGHT YELLOW

- This means the fluid level is below the bottom of the hydrometer. This may have been caused by excessive or prolonged charging, a broken case, or excessive tipping. When finding a battery in this condition it may indicate high charging voltages caused by a faulty charging system, therefore, the charging and electrical systems may need to be checked. If a cranking complaint exists and is caused by the battery, the battery should be replaced.

DIAGNOSIS

BATTERY TESTING

Figures 3, 4 and 5

The following procedure should be used for testing batteries:

1. VISUAL INSPECTION

- Check for obvious damage, such as a cracked or broken case or cover that could permit loss of electrolyte. If obvious damage is noted,

Figure 3 - Built-In Hydrometer

Figure 4 - Battery Side Terminal Adapters

replace the battery. Determine the cause of damage and correct as needed. If not, proceed to step 2.

2. HYDROMETER CHECK (Figure 3).

- GREEN DOT VISIBLE - Go to step 3.
- DARK; GREEN DOT NOT VISIBLE.
- Charge the battery as outlined under "Charging Procedure" in this section and proceed to step 3.

3. LOAD TEST

- Load testing requires using battery side terminal adapters to ensure good connections (Figure 4). Do not load test a frozen battery.

- Connect a voltmeter and a battery load tester across the battery terminals.
- Apply a 300-amp load for 15 seconds to remove surface charge from the battery.
- Wait 15 seconds to let the battery recover. Apply load specified on the battery label or in "Specifications" at the end of this section. Read voltage after 15 seconds, then remove load.
- If voltage does not drop below the minimum listed in Figure 5, the battery is good and should be returned to service. The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the past few hours.

6D1-4 BATTERY

ESTIMATED TEMPERATURE	MINIMUM VOLTAGE
21°C (70°F)	9.6
10°C (50°F)	9.4
0°C (32°F)	9.1
-10°C (14°F)	8.8
-18°C (0°F)	8.5
BELOW: -18°C (0°F)	8.0

02-14-95
BS0056D1

Figure 5 - Battery Voltage Drop Temperature

E. If voltage drops below the minimum listed, replace the battery.

BATTERY ELECTRICAL DRAIN

Battery electrical drain is the small amount of current required by specific control modules that is needed to retain system memory and system monitoring. Too much electrical drain, however, can cause an extremely discharged and/or permanently damaged battery. To test the battery electrical drain, refer to "Parasitic Load Test" in this section.

Parasitic Load Test

Figure 6

Tool Required:

J 38758 Parasitic Draw Test Switch

If the battery discharges while the vehicle sits for a few hours or days, the vehicle should be diagnosed for parasitic loads. Simple connection of an ammeter in series with the battery may not find the cause as the condition may not show up when power is restored unless that particular component is repeatedly cycled. Parasitic loads can be diagnosed using either of the procedures below, but use of the special tool as described in the first procedure is recommended.

NOTICE: Parasitic draw test switch should never be turned to "OFF" position with engine running or damage could occur to attached ammeter or vehicle electrical system.

1. Turn test switch knob to "OFF" position.

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in Section 0A.

2. Remove battery negative cable.
3. Install parasitic draw test switch male (cable) end to negative battery terminal.
4. Install battery negative cable to female end of test switch tool.
5. Turn test switch tool knob to "ON" position.
6. Road test vehicle while activating all accessories (radio, A/C, etc.).

Figure 6 - Use of Parasitic Draw Test Switch

7. Turn ignition switch to "LOCKED" position and remove ignition key.
8. Disconnect underhood lamp.
9. Set ammeter to 10-amp scale and connect to terminals on test switch tool with alligator clips. Use of 10-amp scale may prevent damage to meter.
10. Turn test switch tool knob to "OFF" position to allow current to flow through ammeter.
11. Check current reading. Allow time for reading to stabilize. Electronic level control (ELC) will remain active for 6 minutes. If current reading is at or below two amps, turn test tool knob to "ON" position (to maintain continuity in electrical system) and switch to a lower scale for a more accurate reading, or install a more accurate meter, if necessary. Turn test tool knob to "OFF." If current reading is above 25 milli-amps, refer to component parasitic load chart for specific

current loads and microprocessor “time-outs” for modules in “awake” and “asleep” states. Total reading below 20 milli-amps is normal, and a reading below 25 milli-amps is acceptable. A zero reading indicates a problem with meter, scale being used, or connection.

12. If current draw is above specifications listed in component parasitic load chart, remove system maxi-fuses and circuit breakers one at a time until current draw returns to a value less than or equal to specifications listed. This should be done while monitoring ammeter so that a disruption of drain will be evident. Perform steps 10 and 11 each time a fuse is removed. Refer to SECTION 8A for specific circuit schematics. Total readings in the hundreds of milli-amps may suggest grounded wires, sticking relays, or small lamps remaining lit.

! Important

- Always turn test switch tool knob to “ON” position before removing each fuse to maintain continuity in electrical system and to avoid damaging ammeter due to accidental overloading (i.e., opening door). Do not turn switch to “OFF” while engine is running.
13. When cause of excessive current draw has been located and repaired, repeat steps 10 and 11 to verify the repair. Then turn test tool to “OFF,” remove tool, and reconnect battery negative cable to battery negative terminal.
 - Before performing a follow-up test drive, allow HVAC to calibrate itself due to disconnecting battery.

⌚ Tighten

- Battery negative cable to 17 N.m (13 lb. ft.).

COMPONENT PARASITIC LOADS (mA)

Component	Approximate Parasitic Draw (mA)
Keyless Entry	2
Voltage Regulator in Generator	1
HVAC Control Head-C68	
Before 2.5 hour timeout	13 - 15
After 2.5 hour timeout*	5
ELC Height Sensor	
Before 6 minute timeout	400
After 6 minute timeout*	1
PCM	5-10
Radio Control Head	5
PASS-Key II® (Theft Deterrent) Module	5
*After specified timeout period elapses, component switches from “AWAKE” to “ASLEEP” mode. Total parasitic draw should not exceed 25 mA.	

Alternate Parasitic Load Test

Figures 4 and 7

The following alternate procedure may be used when testing for parasitic loads if J 38758 is not available.

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Disconnect battery negative cable.
2. Install a battery side terminal adapter, AC Delco P/N ST-120 or GM P/N 12303040 or equivalent, in negative terminal of battery (Refer to Figure 4).

3. Install other battery side terminal adapter or a 3/8-inch nut with standard threads (16 NC) on battery negative cable to assure a good electrical contact with metal face on cable for testing (add a washer behind nut if nut does not contact firmly). Yellow or black finish nuts are generally non-conductive and should not be used.
4. With all lights, accessories, and ignition switch off, connect a high capacity ammeter (at least 10 amps) from battery negative cable to side terminal adapter. This high capacity ammeter is connected to verify whether or not a high current draw is occurring at a constant rate. It is this type of high current draw which will blow the fuse in lower capacity ammeters.

6D1-6 BATTERY

Figure 7 - Alternate Parasitic Load Diagnosis Procedure

NOTICE: If a high capacity ammeter is not available, install a section of heavy wire (preferably battery cable section) between existing battery negative cable and side terminal adapter. Allow time for initial draw to occur or check for reduced current with an inductive ammeter (current clamp) and proceed to step 5.

5. With high capacity ammeter or battery cable section still connected, connect digital multimeter, set on 300 mA dc range, in parallel with high reading ammeter.
6. Disconnect high capacity ammeter and take reading with digital multimeter. If current draw is above specifications listed in component parasitic load chart, remove system fuses and mini-breakers one at a time until current draw returns to a value less than or equal to specifications listed. This should be done while monitoring ammeter so that a disruption of drain will be evident. Refer to the "COMPONENT PARASITIC LOADS (mA)" chart in this section for approximate parasitic loads for various vehicle components. Set ammeter on maximum scale when pulling fuses to avoid damage. Refer to SECTION 8A for specific circuit schematics.
7. When cause of excessive draw has been located and repaired, repeat step 6 to verify the repair. Reconnect battery negative cable to battery negative terminal.

- Before performing a follow up test drive, allow HVAC to calibrate itself due to disconnecting battery.

Tighten

- Battery negative cable to 17 N.m (13 lb. ft.).

ON-VEHICLE SERVICE

BATTERY CHARGING

NOTICE: Always disconnect the battery negative cable when charging a battery or electronic components may be damaged.

When it is necessary to charge the battery, follow these basic rules:

1. Do not charge battery if hydrometer is clear or light yellow. Replace battery.
2. If the battery feels hot (52° C (125° F) or higher), or if electrolyte violently gasses or spews through the vent holes, discontinue charging or reduce charging rate.
3. Do not charge a battery if it seems to be frozen.

Charging Procedure

Tool Required:

AC Delco P/N ST-1201 or GM P/N 12303040

Battery Side Terminal Adapters (Pair)

1. Batteries with green hydrometer dot showing do not require charging unless they have just been discharged (such as in cranking vehicle).
2. When charging battery with side terminals, install adapter kit (AC Delco P/N ST-1201 or GM P/N 12303040 or equivalent). Refer to Figure 4.

The adapter should be snugged up against the battery terminals to keep resistance between the adapter and the battery terminal to a minimum. Recommended battery side terminal adapter torque is 15 N.m (12 lb. ft.).

3. Make sure all battery charger connections are clean and tight.
4. For best results, batteries should be charged while electrolyte and plates are at room temperature. A battery that is extremely cold may not accept current for several hours after starting battery charger.
5. Charge battery until green dot of built-in hydrometer appears. Refer to "Charging Time Required" in this section. Battery should be checked every half-hour while charging. Tap the hydrometer lightly on top to dislodge any air bubbles that might cause a false indication.
6. After charging, battery should be tested. Refer to "Diagnosis" in this section.

Charging Time Required

The time required to charge a battery will vary depending on the following factors:

- Size of Battery - A completely discharged large heavy-duty battery requires more than twice the recharging as a completely discharged small passenger vehicle battery.
- Temperature - A longer time will be needed to charge any battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery the current accepted by the battery will be very low at first, then in time, the battery will accept a higher rate as the battery warms.
- Battery Charger Capacity - A battery charger which can supply only five amps will require a much longer period of charging than a battery charger that can supply 30 amps or more.
- State-Of-Charge - A completely discharged battery requires more than twice as much charge as a half-charged battery. Because the electrolyte is nearly pure water and a poor conductor in a completely discharged battery, the current accepted by the battery is very low at first. Later, as the charging current causes the electrolyte acid content to increase, the charging current will also increase.

CHARGING VOLTAGE

HOURS

16.0 or more	Up to 4 Hours
14.0 - 15.9	Up to 8 Hours
13.9 or less	Up to 16 Hours

CHARGING A VERY LOW OR COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a very low or completely discharged battery, and unless the procedure is properly followed, a perfectly good battery may be needlessly replaced.

1. Measure voltage at battery terminals with an accurate voltmeter. If below 11 volts, the charge current will be very low and it could take some time before it accepts a current in excess of a few milliamps. Such low current may be detectable on ammeters available in the field.
2. Set battery charger on high setting.
3. Some chargers feature polarity protection circuitry which prevents charging unless the battery charger leads are connected to the battery terminals correctly. A completely discharged battery may not have enough voltage to activate this circuitry even though battery charger leads are connected properly, making it appear that the battery will not accept charging current. Therefore, follow the specific charger manufacturer's instruction telling how to bypass or override the circuitry so that the charger will turn on and charge a low-voltage battery.
4. Battery chargers vary in the amount of voltage and current they provide. The time required for the battery to accept measurable charger current at various voltages may be as follows: If the charge current is still not measurable at the end of the above charging times, the battery should be replaced. If the charge current is measurable during the charging time, the battery is considered good and charging should be completed in the normal manner.
5. It is important to remember that a completely discharged battery must be recharged for a sufficient number of ampere hours (AH) to restore it to a usable state. As a general rule of thumb, using the reserve capacity (RC) rating of the battery as the number of ampere hours of charge will usually bring the green dot into view. For reserve capacity refer to "Specifications" in this section. If battery is rated at 75 RC minutes, it would usually be completely recharged as follows: 10 ampere charge x 7 1/2 hours = 75 AH or 25 ampere charge x 3 hours = 75 AH, etc.
6. It is recommended that any battery recharged by this procedure be LOAD TESTED to establish serviceability. Refer to "Battery Testing" in this section.

JUMP STARTING IN CASE OF EMERGENCY WITH AUXILIARY (BOOSTER) BATTERY

Both auxiliary battery and discharged battery assembly should be treated carefully when using jumper cables.

6D1-8 BATTERY

CAUTION: Departure from these conditions or the procedure below could result in: (1) serious personal injury (particularly to eyes) or property damage from such causes as battery explosion, battery acid, or electrical burns; and/or (2) damage to electronic components of either vehicle. Never expose battery to open flame or electric spark - batteries generate a gas which is flammable and explosive. Remove rings, watches, and other jewelry. Wear approved eye protection. Do not allow battery fluid to contact eyes, skin, fabrics, or painted surfaces-battery fluid is a corrosive acid. Flush any contacted area with water immediately and thoroughly. Be careful that metal tools or jumper cables do not contact the battery positive terminal (or metal in contact with it) and any other metal on the vehicle, because a short circuit could occur.

1. Set parking brake lever and place automatic transmission in "PARK." Turn "OFF" the ignition, lamps and all other electrical loads.
2. Check the built-in hydrometer. If it is clear or light yellow, replace the battery.

NOTICE: Do not jump start a vehicle with charging equipment unless the equipment is specifically designed for jump starting. Using improper equipment can cause serious damage to the electrical system or electronic parts.

3. Attach the end of one jumper cable to the auxiliary battery positive terminal and the other end of the same cable to the positive terminal of the junction block. Do not permit vehicles to touch each other as this could cause a ground connection and counteract the benefits of this procedure.

CAUTION: To prevent sparking and possibly explosion of battery gases, do not connect jumper cable directly to the battery negative terminal of the dead battery.

4. Attach one end of the remaining negative cable to the auxiliary battery negative terminal, and the other end to a solid engine ground (such as the compressor bracket or power steering pump bracket) at least 46 cm (18 inches) from the battery of the vehicle being started.
5. Start the engine of the vehicle that is providing the jump start and turn off electrical accessories. Then start the engine in the vehicle with the discharged battery.
6. Reverse these directions exactly when removing the jumper cables. The negative cable must first be disconnected from the engine that was jump started.

BATTERY TRAY REPLACEMENT

Figure 8

Remove or Disconnect

1. Battery. Refer to "Battery Replacement" in this section.
2. Wheelhouse panel bolts/screws (1), battery tray nut (2), and battery tray bolt/screw (3) holding battery tray (4) to wheelhouse panel.
3. Battery tray (4).

Install or Connect

NOTICE: Refer to "Notice" on page 6D1-1 of this section.

1. Battery tray (4) to wheelhouse panel.
2. Wheelhouse panel bolts/screws (1), battery tray nut (2), and battery tray bolt/screw (3) holding battery tray (4) to wheelhouse panel.

Tighten

- Wheelhouse panel bolts/screws (1) and battery tray bolt/screw (3) to 25 N·m (18 lb. ft.).
3. Battery Refer to "Battery Replacement" in this section.

Figure 8 - Battery Tray

BATTERY REPLACEMENT

Figure 9

 Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in Section 0A.

1. Battery negative cable (7) from battery negative terminal.
2. Any brackets or braces that are in the way.
3. Battery positive cable (5) from battery positive terminal.
4. Battery holding retainer bolt/screw (8) and battery holding retainer (9).
5. Battery (6).
6. Insulator (1) from battery (6).

 Install or Connect

NOTICE: Refer to “Notice” on page 6D1-1 of this section.

1. Insulator (1) to battery (6).
2. Battery (6).
3. Battery holding retainer (9) and battery holding retainer bolt/screw (8).

 Tighten

- Battery holding retainer bolt/screw (8) to 18 N.m (13 lb. ft.).
4. Battery positive cable (5) to battery positive terminal.

 Tighten

- Battery positive cable (5) to 17 N.m (13 lb. ft.)
 - Battery negative cable (7) to 17 N.m (13 lb. ft.).
5. Any brackets or braces that were removed.
 6. Battery negative cable (7) to battery negative terminal.

BATTERY CABLE REPLACEMENT AND ROUTING

Whenever battery cables are replaced, always be certain to use a replacement battery cable that is the same type and length. Some positive cables have additional feed wires attached to them and some negative cables have additional ground straps attached. Always be certain when replacing a battery cable to route it the same as the one being replaced.

Figure 9 - Battery

6D1-10 BATTERY

Negative Cable

Figure 10

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in Section 0A.

1. Battery negative cable (7) from battery negative terminal.
2. Negative cable ground bolt/screw (11) and negative cable ground washer (10) and ground strap.
3. Generator. Refer to SECTION 6D3.
4. Nut (18), washer (13), and cable (7) from bolt/screw (12).
5. Any clamps or retainers securing negative cable (7) to body.
6. Negative cable (7) from vehicle.
 - Note routing.
 - Route as noted during removal.

Install or Connect

NOTICE: Refer to “Notice” on page 6D1-1 of this section.

1. Negative cable (7) to vehicle.

Important

- Route battery negative cable over and through generator support bracket.
2. Any clamps or retainers securing negative cable (7) to body.
 3. Negative cable (7), washer (13), and nut (18) to bolt/screw (12).

Tighten

- Nut (18) to 34 N.m (25 lb. ft.).
4. Generator. Refer to SECTION 6D3.
 5. Negative cable ground bolt/screw (11), negative cable ground washer (10) and ground strap.

Tighten

- Negative cable ground bolt/screw (11) to 4 N.m (35 lb. in.).
6. Battery negative cable (7) to battery negative terminal.

Tighten

- Battery negative cable (7) to 17 N.m (13 lb. ft.).
7. Battery negative cable (7) to battery negative terminal.

Tighten

- Battery negative cable (7) to 17 N.m (13 lb. ft.).

Positive Cable

Figure 11

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in Section 0A.

1. Battery negative cable (7) from battery negative terminal.
2. Battery positive cable (5) from battery positive terminal.
3. Generator lead nut (16) from generator.
4. Positive cable bolts/screws (17).
5. Positive cable nuts (18) and battery positive cable (5) from starter solenoid switch and electrical center.

Install or Connect

NOTICE: Refer to “Notice” on page 6D1-1 of this section.

NOTICE: Before installing battery positive cable to starter solenoid switch, be sure solenoid terminal is secure in cap by tightening terminal nut on battery cable post. If terminal is not tight in solenoid cap, the cap may be damaged during installation of battery cable and cause starter to fail later.

Tighten

- Solenoid battery terminal nut to 10 N.m (89 lb. in.).
1. Battery positive cable (5) and positive cable nuts (18) to starter solenoid switch and electrical center.

Tighten

- Positive cable nuts (18) to 10 N.m (89 lb. in.).
2. Positive cable bolts/screws (17) to frame.

Tighten

- Positive cable bolts/screws (17) to 4.8 N.m (42 lb. in.).
3. Generator lead nut (16) and battery positive cable (5) to generator.

Tighten

- Generator lead nut (16)...13 N.m (115 lb. in.).

Figure 11 - Battery Positive Cable

4. Battery positive cable (5) to battery positive terminal.

Tighten

- Battery positive cable (5) to 17 N.m (13 lb. ft.).

GROUND STRAPS

Additional ground straps are used to connect the body and frame to the engine and transmission. Always connect all ground straps to ensure a good ground path to the battery from all electrical components.

CHARGING EQUIPMENT

A battery charger that is considered sufficient is usually capable of a 16-volt output. When choosing a charger, the following items should be considered essential:

1. A 16-volt minimum output.

2. To prevent overcharging, the unit should have a timer (1 to 2 hours) or a voltage regulator that would regulate a maximum of 18 volts, or have an automatic shut-off feature at full charge.
3. Ammeter or charging rate meter.
4. An automatic polarity protector. Some equipment that is available includes the AC Delco MP2101-07, Associated No. 6001, the Sun 720, or equivalent. Very few chargers have sensitive low-voltage meters, therefore, separate voltmeters may be necessary. A suitable load tester such as the Sun VAT-40 (or equivalent) is available and is a very useful tool to properly diagnose battery problems.

SPECIFICATIONS

BATTERY USAGE CHART

CATALOG NUMBER	TEST LOAD AMPS	COLD CRANKING AMPS*	RESERVE CAPACITY MINUTES*	REPLACEMENT NUMBER
514	260	525	90	75-60
744	380	770	115	78A-72
746	380	770	115	78A-72

*Cold Cranking = Amperage available for 30 seconds of engine cranking at -18°C(0°F).

*Reserve Capacity = The approximate time in minutes a storage battery assembly can support a 25 amp load without the terminal voltage dropping below 10.5 volts at 27°C (80°F) in the event of a charging system failure.

SPECIAL TOOLS

SECTION 6D2

CRANKING SYSTEM

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Before removing or installing any electrical unit, or when a tool or equipment could easily come in contact with "live" exposed electrical terminals, disconnect the battery negative cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the "OFF" or "LOCK" position.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

6D2-2 CRANKING SYSTEM

GENERAL DESCRIPTION

STARTER USAGE

Figure 1

Three different starters are used for the 1996 models. Refer to the following chart to determine the correct starter application.

VEHICLE	ENGINE	STARTER
CAPRICE SEDAN	4.3L L99	SD-260
	5.7L LT1	PG-250
BUICK SEDAN	5.7L LT1	PG-250
CAPRICE WAGON	5.7L LT1	PG-260
BUICK WAGON	5.7L LT1	PG-260

Although the PG-250 and the PG-260 starter motors look similar, the PG-260 is lighter and uses a different solenoid, which requires a different battery positive cable, due to the terminal locator. Both PG starter motors have an anodized metal (gold colored) finish. The starter attachment and pinion-to-flywheel clearance is the same for both starters, but because of the different battery positive cable attachments, the PG starter motors are not interchangeable. The SD-260 starter motor is black and is only used on the Caprice sedan with the 4.3L L99 engine.

CRANKING CIRCUIT

The cranking circuit consists of the battery, theft deterrent relay, theft deterrent module, starter motor, ignition switch and related electrical wiring. Refer to SECTION 8A-30 for a complete electro-mechanical schematic.

STARTER MOTOR

Figure 1

When the ignition switch is moved to the start position, a start request is sent to the theft deterrent module. If correct PASS-Key II® resistance is detected and vehicle is in "PARK" or "NEUTRAL," then the theft deterrent module will energize the starter enable relay. The starter enable relay will send battery voltage to the starter solenoid switch. As the solenoid is energized, the starter shift lever moves into crank position, causing the starter drive pinion to engage the flywheel ring gear. After engagement, the starter solenoid switch will close the motor main contacts, which results in cranking of the engine. When the engine starts, the starter's overrunning clutch protects the armature from excessive speed until the switch is opened, at which time the solenoid switch plunger spring causes the pinion to disengage. To prevent excessive overrun, the ignition switch should be opened immediately when the engine starts.

Figure 1 - Starter Motor Identification

DIAGNOSIS

NOTICE: Never operate the starter motor more than 30 seconds at a time without pausing to allow it to cool for at least two minutes. Overheating, caused by excessive cranking, will seriously damage the starter motor.

The diagnosis in this section covers mechanical problems only such as noises. For electrical diagnosis, refer to SECTION 8A-30. If the "PASS-Key" light remains on (after a five second bulb check) while the ignition is in "RUN," then refer to SECTION 8A-133.

NOISE DIAGNOSIS

Starter motor noise could be caused by worn or damaged components, or incorrect pinion-to-flywheel clearance.

1. Raise and suitably support vehicle. Refer to SECTION 0A.

Inspect

2. Starter mounting bolts/screws for correct torque.

Tighten

- Starter mounting bolts/screws to 47 N.m (35 lb. ft.).
3. Remove transmission converter cover and inspect flywheel teeth.
 - Rotate flywheel while observing teeth. If any teeth are damaged or worn, flywheel must be replaced.

Measure

- Flywheel-to-pinion clearance.
 - A. Disconnect battery negative cable.

Figure 2 - Measuring Flywheel-to-Pinion Clearance

- B. Disconnect field lead from starter motor solenoid terminal "M" and tape end so it will not contact solenoid.
- C. Connect battery negative cable.
- D. Apply battery voltage to the starter solenoid terminal "S" and flash jumper terminal "M" to ground. This will engage the pinion to the flywheel.
- E. Using a wire type gage, measure the flywheel-to-pinion clearance as shown in figure 2. Clearance should be 0.5 mm (0.020 in.).
- F. Single shims installed on the outer bolt/screw are used to decrease clearance, double shims installed on both bolts/screws are used to increase clearance. Shims are not used when engine is manufactured, they are only used as a service repair to correct a noise condition.

Refer to the "Starter Motor Whine Diagnosis Chart" in this section for more information.

STARTER MOTOR WHINE DIAGNOSIS

PROBLEM	CAUSE
• HIGH PITCHED WHINE DURING CRANKING (BEFORE ENGINE FIRES) BUT ENGINE CRANKS AND FIRES OK.	PINION-TO-FLYWHEEL DISTANCE TOO GREAT.
• HIGH PITCHED "WHINE" AFTER ENGINE FIRES, AS KEY IS BEING RELEASED. ENGINE CRANKS AND FIRES OK. THIS INTERMITTENT COMPLAINT IS OFTEN DIAGNOSED AS "STARTER HANG-IN" OR "SOLENOID WEAK."	PINION-TO-FLYWHEEL DISTANCE TOO SMALL.
• A LOUD "WHOOOP" AFTER THE ENGINE FIRES BUT WHILE THE STARTER DRIVE PINION IS STILL HELD ENGAGED. SOUNDS LIKE A SIREN IF THE ENGINE IS REVVED WHILE STARTER DRIVE PINION IS ENGAGED.	REPLACE STARTER DRIVE.
• A "RUMBLE," "GROWL," OR (IN SEVERE CASES) A "KNOCK" AS THE STARTER MOTOR IS COASTING DOWN TO A STOP AFTER STARTING THE ENGINE.	MOST PROBABLE CAUSE IS A BENT OR UNBALANCED ARMATURE. REPLACE ARMATURE.

ON-VEHICLE SERVICE

LUBRICATION

Starter motors do not require lubrication except during overhaul. When the starter motor is taken apart for any reason, lubricate only as described under "Unit Repair" in this section.

STARTER MOTOR REPLACEMENT

Figure 3

Important

- This vehicle was designed for starter mounting without shims. However if single shims (13) or double shims (14) have been added to correct a noise or engagement condition, they should be reinstalled in their original location to ensure proper pinion-to-flywheel engagement.

CAUTION: Refer to "Caution" on page 6D2-1 of this section.

Remove or Disconnect

1. Battery negative cable.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Two starter mounting bolts/screws (16 and 17) and lower starter motor (15, 18, or 19).
4. Electrical leads from starter motor (15, 18, or 19).
 - Note position of wires before disconnecting.
5. Starter motor (15, 18, or 19).

Install or Connect

NOTICE: Refer to "Notice" on page 6D2-1 of this section.

NOTICE: Before attaching electrical leads, tighten inner nuts on the solenoid terminals. If the nuts are not tight, solenoid cap may be damaged during installation of leads. Tighten inner nut of "BAT" terminal to 9 N.m (80 lb. in.) on PG-250. This does not apply to the PG-260 starter motor.

1. Electrical leads to starter motor (15, 18, or 19).

Tighten

- Starter solenoid switch "BAT" terminal outer nut to 9 N.m (80 lb. in.) on SD-260, PG-250, or PG-260.
 - Starter solenoid switch "S" terminal nut to 2.5 N.m (22 lb. in.).
2. Starter motor (15, 18, or 19) to engine.
 3. Bolts/screws (16 and 17) and shims (13 or 14), if removed.

Tighten

- Bolts/screws (16 and 17) to 47 N.m (35 lb. ft.).
4. Battery negative cable.

Tighten

- Battery negative cable to 15 N.m (11 lb. ft.).

UNIT REPAIR

Only the SD-260 and PG-250 unit repair service information is included in this section. The PG-260 starter motor should be serviced as an assembly.

Figure 3 - Mounting Starter Motor

STARTER SOLENOID SWITCH REPLACEMENT

Figures 4 and 10

When a “no crank and no sound” starter motor condition exists, check solenoid switch (3 or 56) before disassembling starter motor. Solenoid switch (3 or 56) can be checked without removal. Refer to “Cleaning, Inspection and Testing” in this section. The solenoid switch (3) on the PG-250 starter motor is part of the starter drive housing. Refer to “PG-250 Starter Motor Disassembly” and “PG-250 Starter Motor Assembly” for replacement procedure.

NO-LOAD TEST

Figure 5

With carbon pile “OFF,” make connections as shown in Figure 5. Close the switch, adjust carbon pile to obtain 10 volts, and compare the RPM, current

and voltage readings with “Specifications” listed at the end of this section. Disconnect leads only with the switch open. Use the test results as follows:

1. Rated current draw and no-load speed indicates normal starter motor condition.
2. Low free speed and high current draw indicates:
 - Too much friction. This can be caused by tight, dirty or worn bearings, or bent armature shaft allowing armature to drag.
 - Shorted armature. This can be further checked with growler after disassembly.
 - Grounded armature or fields. Check further after disassembly.
3. Failure to operate with high current draw indicates:
 - Direct ground in terminal or fields.
 - “Frozen” bearings (this should have been determined by hand turning armature).
4. Failure to operate with no current draw indicates:
 - Open field circuit. After disassembly inspect internal connections and trace circuit with test lamp. (Refer to Figure 6).
 - Open armature coils. Inspect commutator for badly burned bars after disassembly.
 - Broken brush springs, worn brushes, high insulation between commutator bars or other causes which would prevent good contact between brushes and commutator.
5. Low no-load speed and low current draw indicates:
 - High internal resistance due to poor connections, defective leads, dirty commutator and causes listed above under number 4.
6. High free speed and high current draw usually indicate shorted fields.
 - If shorted fields are suspected, replace field coil. Also check for shorted armature, using growler.

SD-260 STARTER MOTOR

SD-260 Starter Motor Disassembly

Figures 9 and 10

Disassemble

1. Nuts (62) and heat shield (71), if equipped, from clamp bolts/screws (63).
2. Nut (61) and field lead from solenoid switch (56).
3. Clamp bolts/screws (63) and solenoid switch (56) with clamp (66) from drive housing (54).
4. Bolts/screws (65) from starter motor.
5. Commutator end frame (49), brake washer (64), and frame kit (51) from armature (52) and drive housing (54).
6. Plug (67) from drive housing (54).
7. Armature (52) with starter drive (53), shift lever (57), plunger (68), and starter solenoid switch plunger spring (72) from drive housing (54).

6D2-6 CRANKING SYSTEM

Figure 4 - PG-250 Starter Motor Disassembled View

8. Starter solenoid switch plunger spring (72) from plunger (68).
9. Plunger (68) from shift lever (57).
10. Shift lever (57) from drive housing (54) by spreading lever arms slightly to disengage.
11. Thrust collar (60) from armature shaft.
12. Retainer (59) by pushing starter drive stop collar (58) off of retainer (59) and sliding it off of armature shaft.
 - Discard retainer (59).
13. Starter drive stop collar (58) and starter drive (53) from armature shaft.

Cleaning, Inspection, and Testing (SD-260 Starter Motor)

Figures 5 through 10

NOTICE: Do not use grease dissolving solvents for cleaning the overrunning clutch or armature. Solvents dissolve the grease packed in the clutch and damage armature and field coil insulation.

1. Clean all starter motor parts. Wipe parts clean with a clean shop cloth.
2. Test starter drive (53) action. Pinion should turn freely in overrunning direction. Check pinion teeth for chipping, cracking or excessive wear. Replace starter drive (53) if necessary. Badly chipped pinion teeth may indicate chipped teeth on the ring gear. Replace as necessary.
3. Check starter drive (53) for slipping by leaving starter drive (53) attached to armature (52). Wrap armature (52) with shop towel and clamp in vice. Using 12-point deep socket and torque wrench, put socket on pinion and turn counterclockwise. Drive should not slip with up to 68 N.m (50 ft. lb.) of applied torque. If it does, replace starter drive (53).
4. Starter drive (53) requires no lubrication; however, starter drive (53) should be wiped clean.

06-08-95
BT0046D2

Figure 5 - No-Load Test

5. Inspect armature commutator. If commutator is dirty, clean with 400 grit polishing cloth. If commutator is rough, replace armature (52). Do not undercut or turn commutators. Inspect points where armature conductors join commutator bars to make sure they have good connection. A burned commutator bar(s) is usually evidence of poor connection.
6. Inspect brushes and brush holders. When brushes appear excessively worn when compared to new brushes they should be replaced. Make sure brush holders are clean and brushes are not binding in brush holders. Full brush surface should ride on commutator to give proper performance.
 - Check to ensure that brush springs are giving firm contact between brushes and commutator. When brush springs are distorted or discolored, they should be replaced.
 - On SD-260 starter motor, all brush and brush holder parts are part of the frame kit (51).
7. If test equipment is available:
 - A. Check armature (52) for short circuits by placing on growler and holding hacksaw blade over armature core while armature is rotated. If saw blade vibrates, armature (52) is shorted. Replace armature (52).

Figure 6 - Testing Series Coil for Open

6D2-8 CRANKING SYSTEM

Figure 7 - Testing Series Coil for Ground

- B. On SD-260 starter motor, check field windings by using self-powered test lamp. Place one lead on field lead terminal and other lead on one insulated brush. If lamp fails to light, series coil is open and will require repair or replacement. Perform this test for each insulated brush to check brush and lead continuity (Figure 6).
- C. On SD-260 starter motor, using self-powered test lamp, place one lead on grounded brush holder and other lead on either insulated brush. If lamp lights, grounded series coil is indicated and frame kit (51) is replaced (Figure 7).

Figure 8 - Testing Solenoid Windings

- D. Check armature (52) for grounds using a self-powered test lamp. Place one lead on commutator and other lead on armature core or shaft. If lamp lights, armature (52) is grounded and must be replaced.
- E. Check current draw of solenoid windings as follows:
- If solenoid switch (56) is not removed from starter motor, field lead must be removed from "M" terminal on solenoid switch (56) before making these tests. Complete tests in minimum of time to prevent overheating of solenoid switch (56).

Figure 10 - SD-260 Starter Motor Disassembled View

Figure 11 - Electrical Connections and Checking Pinion Clearance

- b. To check hold-in winding, connect ammeter in series with 12 volt battery and "S" terminal on solenoid switch (56). Connect voltmeter to "S" terminal and to ground. Connect carbon pile across battery. Adjust voltage to 10 volts and note ammeter reading. Reading should be 10 to 20 amperes.
- c. To check both windings, connect as for previous test. Ground solenoid "M" terminal. Adjust voltage to 10 volts and note ammeter reading. Reading should be 56 to 80 amperes.

! Important

- Current will decrease as windings heat up.
 - Current draw readings that are over specifications indicate shorted turns or a ground in the windings of the solenoid switch (56) and the solenoid switch (56) should be replaced. No or low current draw readings that are under specifications indicate excessive resistance. A zero reading indicates an open circuit. Check connections, then replace solenoid switch (56) if necessary.
8. On SD-260 starter, solenoid switch (56) is serviced as an assembly.

Checking Pinion Clearance (SD-260 Starter Motor)

Figure 11

NOTICE: When the starter motor has been disassembled or the solenoid switch has been replaced, it is necessary to check the pinion clearance. Starter motor may not engage properly if pinion clearance is incorrect.

Measure

- Pinion Clearance as follows:

CAUTION: Keep fingers, tools, and other objects away from opening in drive housing while making electrical connections during this procedure. The strong shifting action of the solenoid switch could cause personal injury or damage as the drive pinion moves into cranking position.

- A. Secure starter motor in vise or equivalent fixture so that opening in drive housing is accessible for measurement.
- B. Disconnect field lead from solenoid switch "M" terminal and insulate it carefully.
- C. Connect one 12-volt battery lead to solenoid switch "S" terminal and the other to starter frame.

Figure 12 - Installing Pinion Stop Collar

- D. Flash jumper lead momentarily from solenoid switch "M" terminal to starter frame. This will shift pinion into cranking position and it will remain so until battery is disconnected.
- E. Push pinion back as far as possible to take up any movement, and check clearance with feeler gage. Clearance should be 0.25 mm to 4.06 mm (0.010 inch to 0.160 inch).
- F. Means for adjusting pinion clearance is not provided on starter motor. If clearance does not fall within acceptable limits, check for improper installation and replace all worn parts.
- G. Disconnect 12-volt battery leads from solenoid switch "S" terminal and starter frame.
- H. Reconnect field lead.

SD-260 Starter Motor Assembly

Figures 10, 12 and 13

Assemble

NOTICE: Refer to "Notice" on page 6D2-1 of this section.

1. Starter drive (53) onto armature shaft.
2. Starter drive stop collar (58) onto armature shaft with flat side toward starter drive (53).
3. New retainer (59) onto armature shaft and slide it down shaft until sealed in shaft groove.

4. Thrust collar (60) onto armature shaft with flange toward retainer (59).

- Use two sets of pliers and squeeze starter drive stop collar (58) and thrust collar (60) to snap starter drive stop collar (58) onto retainer (59).

Inspect

- End bearing (55). If bearing (55) has no lubrication visible or appears damaged, replace bearing (55).
 — Press bearing (55) from drive housing (54) and then press in new bearing (55) until recessed into drive housing casting as shown in figure 13. Bearing (55) is pre-lubricated and no additional lubrication is needed.
5. Shift lever (57) to starter drive (53) by spreading arms slightly.
 6. Plunger (68) to other end of shift lever (57) by snapping into place.
 7. Armature shaft into end bearing (55) while sliding lever retainer (69) into slot in drive housing (54).
 8. Plug (67) into slot in drive housing (54).
 9. Starter solenoid switch plunger spring (72) over plunger (68).
 10. Solenoid switch (56) with clamp (66) to drive housing (54).
 - Align motor terminal and solenoid switch (56) with field lead.
 11. Clamp bolts/screws (63).

Figure 13 - Starter Drive Shaft Drive End Bearing

6D2-12 CRANKING SYSTEM

Tighten

- Clamp bolts/screws (63) to 11 N.m (97 lb. in.).

Clean

- Contact surface of frame kit brushes and armature commutator with soft cloth.

12. Frame kit (51) onto armature (52) and drive housing (54) by pushing in and holding brushes and aligning notch in frame kit (51) with locator on drive housing (54). When in place, release brushes and make sure they move freely and contact commutator.

Inspect

- Bearing (50) in commutator end frame (49). If bearing (50) has no visible lubrication or appears damaged, press in a new bearing (50) until recessed 2 mm (0.08 inch) into commutator end frame (49). Bearing (50) is pre-lubricated and no additional lubrication is needed.
13. Washer (64) onto armature shaft.
 14. Commutator end frame (49) onto armature shaft and seat into frame kit (51).
 15. Identification tag over bolt/screw hole in commutator end frame (49) with fluted end around bearing well.
 16. Bolts/screws (65) to starter motor.

Tighten

- Bolts/screws (65) to 8.5 N.m (75 ft. lb.).

NOTICE: Before attaching electrical leads, tighten inner nuts on solenoid switch terminals. If nuts are not tight, solenoid cap may be damaged during installation of leads. Tighten inner nut at "BAT" terminal to 10 N.m (89 lb. in.).

17. Nut (61) to solenoid switch (56).

Tighten

- Nut (61) to 10 N.m (89 lb. in.).

18. Heat shield (71) and nuts (62) onto protruding ends of clamp bolts/screws (63).

Tighten

- Nuts (62) to 8 N.m (71 lb. in.).

PG-250 STARTER MOTOR

PG-250 Starter Motor Disassembly

Figures 4 and 14

Tool Required:

J 28509-A Counter Gear Bearing Remover

Disassemble

1. Field lead from solenoid switch terminal by removing nut (21).
2. Through bolts/screws (31).
3. Bolts/screws (30) and end frame (29) from starter motor. Brush holder (27) and bearing (11) remain on armature.

CAUTION: Magnets on frame and field have strong attraction to armature. Keep fingers clear of pinch points to prevent personal injury.

4. Armature (9) from frame and field (26).
5. Frame and field (26) and shield (17) from housing (126).
6. Bearing (11) from armature (9), using J 28509-A. Bearing (11) is press-fit over shaft.

NOTICE: Before removing brush holder, lift each brush spring and rest against side of brush; this prevents brush damage when brush holder is pulled off of commutator. If springs are allowed to push brushes down when brushes are moved off of commutator, the brush pigtail lead may be separated from the brush.

7. Brush holder (27) from armature (9).
8. Slightly separate shaft and gear (40) and drive (6) from housing (126) and use a screwdriver to pry plastic shift lever off of pins (34).
9. Shaft and gear (40) and drive (6) from housing (126).
10. Collar (24) from shaft.
11. Slide deep socket over shaft and tap socket to drive collar (41) off of retainer (3).
12. Retainer (3), collar (41) and drive (6) from shaft.
13. Gear (20) and bearing (19) from shaft and gear (40). Bearing (19) is a press-fit into gear (20), and should only be removed if damaged.

Cleaning, Inspection, and Testing (PG-250 Starter Motor)

Figures 4 through 8

Clean

- All starter motor parts. DO NOT USE GREASE DISSOLVING SOLVENTS FOR CLEANING THE OVERRUNNING CLUTCH OR ARMATURE because the solvents dissolve grease packed in the clutch and damages the armature insulation.

Inspect

1. Drive (6) in action. Pinion should turn freely in overrunning direction. Check pinion teeth to see that they have not been chipped, cracked, or excessively worn. Replace drive (6) if necessary.

Badly chipped pinion teeth can indicate chipped ring gear teeth. Replace flywheel if necessary.

- Starter drive (6) requires no lubrication, but it should be wiped clean. **Do not** clean in degreasing tank or wipe with grease dissolving solvents, as they will dissolve lubricant in drive mechanism.
- 2. Armature commutator. If commutator is dirty, clean with 400 grit polishing cloth. Remove all copper dust. If commutator is rough, armature (9) should be replaced. Do not under-cut or turn commutators.
 - Check points where armature conductors join commutator bars for good connection. A burned commutator bar is usually evidence of a poor connection.
- 3. Brushes and brush holders (27). When brushes appear excessively worn when compared to new brushes they should be replaced. Make sure brush holders are clean and brushes are not binding in brush holders (27). Full brush surface should ride on commutator to give proper performance.
 - Check to ensure that brush springs are giving firm contact between brushes and commutator. When brush springs are distorted or discolored, they should be replaced.
- 4. Armature (9) for short circuits by placing on a growler and holding a hack saw blade over armature core while armature is being rotated. If saw blade vibrates, armature is shorted.
 - Clean commutator bars and recheck armature (9) for short circuits. If saw blade still vibrates, replace armature (9).
 - Using a self powered test lamp, place one lead on commutator and other lead on armature core or shaft. If lamp lights, armature (9) is grounded and must be repaired or replaced.
- 5. Solenoid hold-in windings by connecting an ammeter and switch in series with a 12 volt battery and the "S" terminal on the solenoid switch. Connect voltmeter to "S" terminal and ground. Connect carbon pile across battery. Adjust voltage to 10 volts and note ammeter reading. PG-250 starter motor reading should be 10 to 20 amperes. Refer to figure 8 for hook up.

NOTICE: Do not allow both solenoid windings to be energized for more than 15 seconds at a time, or the pull-in winding could be damaged by overheating.

- 6. Both solenoid hold-in windings and pull-in windings by making connections as for previous test. Ground solenoid terminal "M." Adjust voltage to 10 volts and note ammeter reading. PG-250 starter motor reading should be 60 to 85 amperes.
 - Current reading will change as windings heat up.
 - Current draw readings that are over specifications indicate shorted turns or a ground in the solenoid windings. Replace solenoid switch.

- Current draw readings that are under specifications indicate excessive resistance. No reading indicates an open. Check/repair connections when possible; otherwise, replace solenoid switch.

- 7. Solenoid switch and drive housing are serviced as an assembly.
- 8. If test equipment is available:
 - A. Check field windings by using a self-powered test lamp. Place one lead on field lead terminal and other lead on one insulated brush. If lamp fails to light, series coil is open and will require repair or replacement. Perform this test for each insulated brush to check brush and lead continuity. (Figure 6).
 - B. Using a self-powered test lamp, place one lead on grounded brush holder and other lead on either insulated brush. If lamp lights, grounded series coil is indicated and frame kit (51) must be replaced. (Figure 7).

Checking Pinion Clearance (PG-250 Starter Motor)

Figure 11

CAUTION: Keep fingers, tools and other objects away from opening when making electrical connections during this procedure. The strong shifting action of the solenoid switch could cause personal injury or damage as the pinion moves into cranking position.

- 1. Secure starter motor in vise so that opening in drive housing is accessible for measurement.
- 2. Ensure that field lead is disconnected and insulated from solenoid switch terminal.
- 3. Connect positive lead from a 12-volt power source to the solenoid switch "S" terminal. Connect negative lead from power source to a clean ground on starter motor housing. Refer to figure 9 for hook-up. This energizes hold-in coil.
- 4. Momentarily ground solenoid switch terminal "M" to starter motor housing. This energizes the solenoid switch pull-in coil and causes the pinion to move into cranking position. The pinion will stay in this position when the momentary ground is removed.
- 5. Press on drive assembly (24) just enough to take up any free play in the drive pinion as shown in figure 11. Use feeler gages to check clearance between end of pinion and collar (41). Clearance should be 0.25 to 4.06 mm (0.010 to 0.160 inch).
- 6. Disconnect negative (ground) lead from starter motor housing (pinion will retract), then disconnect positive lead from solenoid switch "S" terminal.
- 7. When clearance is outside specifications, recheck starter motor for proper assembly and for worn or damaged parts in shift mechanism and drive assembly. Replace worn parts.

6D2-14 CRANKING SYSTEM

Figure 14 - Removing Commutator End Ball Bearing

PG-250 Starter Motor Assembly

Figures 4, 12, 13, 15, and 16

Inspect

- Bearing (19), bearing (7), shaft and gear (40) and bearing (11). When dry, bearing (19), and shaft and gear (40) may be lightly lubricated with GM lubricant 10497186 or equivalent. Bearings (7 and 11) are permanently lubricated, do not lubricate. If dry, replace the bearings (7 or 11). When installing bearing (7), recess into casting 0.35 mm (0.014 inch), refer to figure 13.

Assemble

NOTICE: Refer to "Notice" on page 6D2-1 of this section.

- Bearing (19) to gear (20). Press bearing to 0.35 mm (0.014 inch) below face of casting. Refer to figure 13.
- Lubricate gear (20), planetary gear of the shaft and gear (40), and the armature shaft gear teeth lightly with GM lubricant 10497186 or equivalent. Refer to figure 15.
- Gear (20) and drive assembly (6) over shaft and gear (40) with pinion away from armature (9).
- Collar (41) onto shaft.
- New retainer (3) into groove on shaft. Do not reuse old retainer (3).

Figure 15 - PG-250 Starter Armature and Drive Assembly.

- Collar (24) to end of shaft with flange toward retainer (3). Use pliers as shown in figure 10 to snap collar (41) over retainer (3).
- Drive assembly (6) and shaft and gear (40) into housing (126).
 - Use a screwdriver to gently guide shift lever over pins (34) on drive assembly (6).
- Shield (17) and frame and field (26) into housing (126).

Inspect

- Brushes. Replace if damaged or excessively worn.
- Brush holder (27) onto armature (9).
- Bearing (11) onto armature (9) by pressing on inner race until bearing (11) rests against shoulder on armature shaft.

CAUTION: Magnets in frame and field have strong attraction to armature. Keep fingers clear of pinch points to avoid personal injury.

Figure 16 - Internal Gear Roller Bearing.

11. Armature (9) to frame and field (26).
12. Frame (29) to brush holder (27) using bolts/screws (30).

 Tighten

- Bolts/screws (30) to 6.5 N.m (58 lb. in.).

13. Through bolts/screws (31).

 Tighten

- Bolts/screws (31) to 8.5 N.m (75 lb. in.).

 Measure

- Pinion clearance. Refer to "Checking Drive Pinion Clearance (PG-250 Starter Motor)" in this section.

NOTICE: When installing electrical connections to starter motor, the inside nut on the solenoid switch battery terminal must be tightened before battery cable is attached. If inside nut is not tight, cap may be damaged during installation of battery cable.

 Tighten

- Starter solenoid switch battery terminal inside nut to 8 N.m (71 lb. in.).

14. Field lead to solenoid switch terminal.

15. Nut (21).

 Tighten

- Nut (21) to 8 N.m (71 lb. in.).

PG-260 STARTER MOTOR

Only the SD-260 and PG-250 unit repair service information is included in this section. The PG-260 starter motor should be serviced as an assembly.

SPECIFICATIONS

STARTER MOTOR PERFORMANCE

4.3L Engine With SD-260 Starter Motor

- No Load Test With 10 Volts
 - Current..... 51 - 71 Amps
 - Starter Drive Pinion Speed..... 7,000 - 11,000 rpm
- Starter Solenoid Switch
 - Hold-in Windings at 10 Volts 10 - 20 Amps
 - Both Windings at 10 Volts..... 56 - 80 Amps

5.7L LT1 Engine With PG-250 Starter Motor

- No Load Test With 10 Volts
 - Current..... 65 - 90 Amps
 - Starter Drive Pinion Speed..... 2700 - 3200 rpm
- Starter Solenoid Switch
 - Hold-in Windings at 10 Volts 10 - 20 Amps
 - Both Windings at 10 Volts..... 60 - 85 Amps

5.7L LT1 Engine With PG-260 Starter Motor

- No-Load Test at 10 volts
 - Current..... 64-95 Amps
 - Starter Drive Pinion Speed..... 2825-3275 RPM
- Starter Solenoid Switch
 - Hold-in Windings at 10 Volts 10-20 Amps
 - Both Windings at 10 Volts..... 60-85 Amps

SPECIAL TOOLS

1. COUNTER GEAR BEARING REMOVER

SECTION 6D3

CHARGING SYSTEM

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

CS-130 AND CS-144 GENERATORS

The charging system (CS) generators use a built-in voltage regulator with fault detection, a stator, rectifier bridge, and rotor with slip rings and brushes. A conventional pulley and fan is used to cool the slip ring end frame, rectifier bridge and voltage regulator. These generators use only two connections - battery positive and "L" terminal to the charge indicator bulb, in addition to the ground path through the generator bracket. Use of the "P," "I," and "S" terminals is optional. The "P" terminal is connected to the stator and may be connected externally to a tachometer or other device. The "I" terminal can be connected directly to battery voltage to power the generators instead of, or in addition to, the "L" terminal which must be stepped down. The "S" terminal may be connected to an external voltage source, such as a voltage near the battery, for voltage control. If the "S" terminal is not used, internal generator voltage is used for control.

The charge indicator bulb receives ignition voltage. This voltage is then sent to the generator for power to the field. If the generator detects an error within, it will ground this circuit which will illuminate the Charge Indicator bulb. This bulb will also illuminate if the engine is not running (generator shaft not rotating). If the charge indicator is illuminated with the engine running, a charging system condition

requiring diagnosis is indicated. The charge indicator will be on with the engine running if system voltage is either too high or too low.

The regulator voltage setting varies with temperature and limits system voltage by controlling rotor field current. While the field current is "on," this regulator actually switches rotor field current on and off at a fixed frequency of about 400 cycles per second to help in controlling radio noise. By varying the overall on-off time, correct average field current for proper system voltage control can be obtained. At high speeds, the on-time may be 10 percent and the off-time 90 percent. At low speeds, with high electrical loads, on-off time may be 90 percent and 10 percent respectively.

DIAGNOSIS

CS GENERATOR ON-VEHICLE CHECK

Tool Required:

J 39688 or equivalent Digital Multimeter

When the CS charging system is operating normally, the warning lamp will come on when the ignition switch is turned on and will go out when the engine starts. If the lamp operates abnormally, or if an undercharged or overcharged battery condition occurs, the following procedure may be used to diagnose the charging system. Remember that an undercharged battery is often caused by accessories being left on overnight, or by a rear compartment or instrument panel compartment lamp

6D3-2 CHARGING SYSTEM

that stays on. If an undercharged battery is noted after vehicle is left overnight, refer to SECTION 6D1 for parasitic load diagnosis.

Noise from a generator may be caused by a loose drive pulley, loose mounting bolts/screws, worn or dirty bearings, faulty diode or faulty stator. To avoid damage to the electrical equipment, always observe the following precautions:

- Do not reverse connections to generator.
- Do not short across or ground any of the terminals in charging circuit, except as directed by instructions.
- NEVER disconnect generator "BAT" terminal with generator operating.
- When connecting charger or booster battery to battery, refer to SECTION 6D1.
- In Chevrolet vehicles, voltmeter is used instead of warning lamp. In this case, steps 1 through 4 below, pertaining to faulty warning lamp operation, should be omitted from troubleshooting procedure.
- Do not attempt to disassemble CS-130 generator. Damage to generator could result.

Trouble in the charging system will show up as one or more of the following conditions:

- Faulty warning lamp operation.
- Undercharged battery, as evidenced by slow cranking or dark hydrometer.
- Overcharged battery, as evidenced by spewing of electrolyte from vents or a yellow hydrometer.

To diagnose the CS-130 or CS-144 charging system, use the following procedure:

Important

- Only the CS-144 generator may be repaired.
1. Visually check belt and wiring.
 2. For vehicles without charge warning lamp, go to step 5.
 3. With ignition switch in "RUN" and engine stopped, lamp should be on. If lamp is not on, detach harness at generator and ground "L" terminal in wiring harness.
 - Lamp lights - repair or replace generator.
 - Lamp does not light - locate open circuit between grounding lead and ignition switch. Lamp bulb may be burned out.
 4. With ignition switch in "RUN" and engine running, lamp should be off. If lamp is not off, detach wiring harness at generator.
 - If lamp goes off, repair or replace generator.
 - If lamp stays on, check for grounded terminal "L" wire in harness.
 5. Battery undercharged or overcharged.
 - A. Detach wiring harness connector from generator.
 - B. With ignition switch in "RUN" and engine not running, connect J 39688 as voltmeter from ground to "L" terminal in wiring harness

connector. Connect to "F" or "I" terminal for gage equipped vehicles. At least one terminal should have battery voltage.

- C. Zero volts indicates open circuit between terminal and battery. Lamp bulb may be burned out. Refer to SECTION 8A-30.
- D. Reconnect harness connector to generator.

CAUTION: Disconnect battery negative cable before installing or removing a series-type ammeter at generator battery terminal.

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

- E. Install ammeter at generator output terminal. With load off, install carbon pile load test across battery terminals. Start engine and run at moderate speed.
- F. Measure voltage across battery, using J 39688. If voltage is above 16 volts, replace or repair generator.
- G. Turn on accessories and load battery with carbon pile to obtain maximum generator output. Maintain voltage at 13 volts or above. Use ammeter to check amperage. Compare output to ampere rating in "Specifications" at the end of this section.
 - If within 15 amps of rated output, generator is OK.
 - If not within 15 amps of rated output, repair or replace generator.

CS GENERATOR BENCH CHECK

Figure 1

Tool Required:

J 39688 or equivalent Digital Multimeter

The following bench check may be used to simulate operation on a vehicle. Use the bench check to verify operation of a CS-144 generator that has been repaired.

1. Mount generator in suitable test stand according to test stand manufacturer's instructions. Test stand must be capable of driving generator assembly at 6,500 rpm.
2. Make connections as shown in Figure 1. Be sure carbon pile is turned off. Ground polarity of generator and battery must be same. Battery must be fully charged. Use a 30-500 ohm resistor between battery and "L" terminal of generator.
3. Slowly increase generator speed and observe voltage using J 39688.

Important

- The battery must be fully charged when making this test.
4. If voltage is uncontrolled and increases above 16 volts, repair or replace generator.

Figure 1 - Generator Bench Check

5. If voltage is below 16 volts, increase speed and connect and adjust carbon pile to obtain maximum amperage output. Maintain voltage above 13 volts.
6. Use ammeter to check amperage. If output is within 15 amps of rated output, generator is good.
7. If output is not within 15 amps of rated output, repair or replace generator.

! Important

- Only the CS-144 generator may be repaired.

ON-VEHICLE SERVICE

The CS generators do not require periodic lubrication. The rotor shaft is mounted on internally-lubricated, sealed bearings which do not require periodic lubrication. At periodic intervals, check mounting bolts/screws for tightness and check belt tension. Refer to SECTION 6A4A.

GENERATOR REPLACEMENT

Figures 2 and 3

↔ Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable from battery terminal.
2. Battery positive cable from generator "BAT" terminal.
3. Nut (27) and bolt/screw (21) from generator (5).
 - Loosen nut (29) and move brace (26) out of way.
4. Bolt/screw (9), nut (12) and brace (1).
5. Nuts (31 and 35), bolt/screw (17) and brace (10).
6. Generator (5).
7. Engine harness electrical connector from generator (5).

→ Install or Connect

NOTICE: Refer to "Notice" on page 6D3-1 of this section.

1. Engine harness electrical connector to generator (5).
2. Generator (5) into position.
3. Brace (10), bolt/screw (17) and nuts (31 and 35).

⌚ Tighten

- Nut (35) to 41 N·m (30 lb. ft.).
 - Nut (31) or bolt/screw (17) to 50 N·m (37 lb. ft.).
4. Brace (1), nut (12) and bolt/screw (9).

⌚ Tighten

- Nut (12) to 41 N·m (30 lb. ft.).
 - Bolt/screw (9) to 50 N·m (37 lb. ft.).
5. Move brace (26) into position.
 6. Nut (27) and bolt/screw (21).

⌚ Tighten

- Nut (27) or bolt/screw (21) to 50 N·m (37 lb. ft.).
 - Nut (29) to 41 N·m (30 lb. ft.).
7. Battery positive cable to generator "BAT" terminal.

⌚ Tighten

- Generator battery terminal nut to 12 N·m (106 lb. in.).
8. Battery negative cable to battery terminal.

⌚ Tighten

- Battery negative cable bolt/screw to 17 N·m (13 lb. ft.).

Figure 2 - Generator and Generator Braces

GENERATOR AND POWER STEERING PUMP BRACKET REPLACEMENT

Figures 2 and 3

This bracket is used to mount the generator and power steering pump on the engine. Bracket replacement procedures are the same for engines equipped with the CS-130, 105-amp generator (K68); and the CS-144, 140 amp generator (KG9).

Remove or Disconnect

1. Radiator upper fan shroud, if vehicle is equipped with mechanical fan. Refer to SECTION 6B.
2. Generator. Refer to "Generator Replacement" in this section.
3. Heater hose clip bolt/screw from bracket (7).
4. Radiator outlet hose nuts from air conditioning compressor studs, if vehicle is equipped with mechanical fan.

- Reposition radiator outlet hose to provide clearance to air conditioning compressor mounting studs.

5. Power steering pump. Refer to SECTION 3B.
6. Air conditioning compressor mounting bolts/screws or studs and rear bracket nut.
7. Air conditioning compressor from bracket (7) and lay aside.
8. Drive belt tensioner bolts/screws (33) and tensioner (32).
9. Bolts/screws (13, 16 and 34).
10. Bracket (7).

Install or Connect

1. Bracket (7).
2. Bolts/screws (13, 16, and 34).

Figure 3 - Generator and Power Steering Pump Bracket

**Tighten**

- A. Bolt/screw (16) to 41 N•m (30 lb. ft.).
 - B. Bolt/screw (34) to 41 N•m (30 lb. ft.).
 - C. Bolt/screw (13) to 41 N•m (30 lb. ft.).
3. Drive belt tensioner (32) and tensioner bolts/screws (33).

**Tighten**

- Tensioner bolts/screws (33) to 25 N•m (18 lb. ft.).
4. Air conditioning compressor to bracket (7).
5. Air conditioning compressor mounting bolts/screws or studs and rear bracket nut.

**Tighten**

- Air conditioning compressor mounting bolts/screws or studs to 50 N•m (37 lb. ft.).
- Air conditioning compressor rear bracket nut to 41 N•m (30 lb. ft.).

6. Power steering pump. Refer to SECTION 3B.
7. Position radiator hose onto air conditioning compressor studs.
8. Radiator outlet hose support nuts to air conditioning compressor studs, if removed.

**Tighten**

- Radiator outlet hose support nuts to 20 N•m (15 lb. ft.).
9. Heater hose clip bolt/screw to bracket (7).

**Tighten**

- Heater hose clip bolt/screw to 1.9 N•m (17 lb. in.).
10. Generator. Refer to "Generator Replacement" in this section.
11. Radiator upper fan shroud, if removed. Refer to SECTION 6B.

6D3-6 CHARGING SYSTEM

UNIT REPAIR

CS-130 105-AMP GENERATOR

NOTICE: Do not attempt to disassemble a CS-130 generator. Damage to the generator could result. The CS-130 generator is replaced as a complete unit.

CS-144 140-AMP GENERATOR DISASSEMBLY, TEST, AND REASSEMBLY

Figures 4 through 12

Disassemble

1. Make scribe marks on slip ring end frame (43) and drive end frame (59) to ease reassembly.
2. Through-bolts/screws (61) and separate slip ring end frame (43) and drive end frame (59).
3. End frame bearing (63) from rotor shaft.

Measure

- Rotor (66) for grounds, opens and shorts (Figure 5).

Figure 5 - Testing Generator Rotor

Figure 4 - Generator Through-Bolt/Screw Location

Figure 6 - Generator Slip Ring End Frame View

! Important

- Test should be performed at approximately 21°C (70°F). A different temperature may result in inaccurate ohmmeter readings.
 - A. Connect ohmmeter to slip ring and clean metal grounding surface on frame of rotor (66) to check for grounds.
 - Ohmmeter should read infinity (open). If not, replace rotor (66).
 - B. Connect ohmmeter to both slip rings to check for shorts and opens.
 - Ohmmeter should read 1.7 to 2.1 ohms. If not, replace rotor (66).
4. Nuts (70).
 5. Stator (36) from slip ring end frame (43).

Measure

- Stator (36) for grounds (Figure 7).
 - A. Connect ohmmeter to stator terminal and to clean metal ground on laminations.
 - B. If ohmmeter reading is low, replace stator (36). Stator (36) cannot be checked for opens and shorts with ohmmeter.
6. Unsolder connections at connector strap (38) and brush holder (69) to voltage regulator (68).
 7. Bolt/screw (67) and bolt/screw (57).

6D3-8 CHARGING SYSTEM

8. Voltage regulator (68) and brush holder (69) with dust shield (60) from slip ring end frame (43).
 - Tap plastic retaining pin from dust shield retaining clip. Be sure to keep pin for reassembly.
9. Brushes (41) and dust shield (60) from brush holder (69).

Clean

- Brushes (41) with soft, dry cloth.

Measure

- Rectifier bridge (53) for continuity (Figure 9).
 - A. Connect ohmmeter to grounded heat sink and flat metal clip at rectifier bridge (53).
 - B. Reverse leads. One reading should be high (open) and one low (continuity). If both readings are the same, replace rectifier bridge (53).
 - C. Repeat test between grounded heat sink and clips at two other bridge terminals.
 - D. Repeat test between insulated heat sink and at bridge terminals.
- 10. Capacitor (39) and rectifier bridge (53).
- 11. Washers (55) and bolts/screws (56 and 58).
- 12. Bearing (63) from slip ring end frame (43) by pushing through to inside.
- 13. Nut (49), using hex wrench to hold rotor shaft.
- 14. Washer (47), pulley (48), fan collar (46), fan (45) and outside collar (50).

15. Rotor (66) from drive end frame (59).
16. Collar (52) from rotor (66).
17. Bolt/screw (51) and retainer (42).
18. Bearing (44).

Assemble

NOTICE: Refer to "Notice" on page 6D3-1 of this section.

1. Bearing (44) in drive end frame (59) by pushing against outer race.
 - Bearing (44) is double sealed; no additional lubricant is required.
2. Retainer (42) and bolts/screws (51).
3. Inside collar (52) onto rotor (66).
4. Rotor (66) to drive end frame (59).
5. Outside collar (50), fan (45), fan collar (46), pulley (48) and washer (47) onto rotor shaft.
6. Nut (49).

Tighten

- Nut (49) to 100 N·m (75 lb. ft.).

Figure 11 - Generator Slip Ring End Frame Components

6D3-10 CHARGING SYSTEM

! Important

- Installation of the slip ring end frame electrical components must be done in the following order to ensure proper operation of the unit. Assembly in any other manner will result in either no output from generator or a direct internal ground in the generator.

8. Rectifier bridge (53).
9. Capacitor (39).
10. Washers (55).
11. Bolts/screws (56 and 58).

! Important

- The capacitor (39) has an insulated material on one side which must rest against the drive end frame (59) (ground).
- The capacitor/rectifier bridge insulated attaching bolt/screw (58) must be installed in the proper hole, attaching the capacitor strap and rectifier bridge (53) to the slip ring end frame (43).

12. Brushes (41) into brush holder (69) with retaining pin (40).
13. Dust shield (60) onto brush holder (69).
14. Voltage regulator (68), and brush holder (69) with dust shield (60), brushes (41) and retaining pin (40) installed into slip ring end frame (43).

! Important

- The metal side of the capacitor strap must be against the regulator connection.
15. Tap plastic retaining pin on dust shield (60) into retaining clip.
 - Be sure brush retaining pin (40) goes through access hole to outside of slip ring end frame (43) for removal after generator is assembled.
 16. Bolt/screw (67) and bolt/screw (57).

Figure 12 - Generator Brushes Retained in Generator Brush Holder

17. Connector strap (38) to voltage regulator solder clip, and brush holder connection to other voltage regulator solder clip.
 - Crimp and solder voltage regulator solder clip connections.

NOTICE: Avoid excessive heat when soldering connections, as this can cause voltage regulator damage.

18. Stator (36), placing stator terminals over rectifier bridge terminals.
19. Nuts (70).
20. Slip ring end frame (43) and drive end frame (59), noting scribe marks.
21. Slip ring end bearing outer race into bearing well in slip ring end frame casting.
22. Through-bolts/screws (61).
23. Remove retaining pin (40) to release brushes (41) against slip rings.

SECTION 6D4

IGNITION SYSTEM

CAUTION: Before removing or installing any electrical unit or when a tool or equipment could easily come in contact with “live” exposed electrical terminals, disconnect the negative battery cable to help prevent personal injury and/or damage to the vehicle or components. Unless instructed otherwise, the ignition switch must be in the “OFF” or “LOCK” position.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide improved engine performance, fuel economy and control of exhaust emissions, the powertrain control module (PCM) controls distributor spark advance (timing) with an ignition control system.

IGNITION SYSTEM

The engine ignition system consists of a distributor, control circuits for ignition timing in the powertrain control module (PCM), a separate ignition coil/ignition control module, a vacuum harness primary and secondary wiring, and the spark plugs. All ignition timing is controlled by the PCM; there is no “bypass” mode built into the ignition control module as in other ignition systems.

The distributor is mounted directly to the camshaft behind the water pump. It directs the spark from the ignition coil to the proper spark plug secondary wire through a rotor. Spark plug secondary wire connectors in the cap are arranged for

convenience in routing spark plug wire harnesses. The corresponding cylinder number is molded into the distributor cap next to each spark plug secondary wire connector.

The distributor also contains a signal disk and two optical camshaft position (CMP) sensors that provide signals to the PCM for timing control. One sensor sends 360 pulses per crankshaft revolution for high-resolution timing control. The other senses eight disk slots of variable length, providing four pulses per crankshaft revolution for a low-resolution signal that tells the PCM which spark plug is being fired. The PCM can determine if one of the timing inputs is not being received by comparing the two inputs. If the PCM detects one timing pulse without detecting the other timing pulse, diagnostic trouble codes 16 or 36 will set. Power for the optical CMP sensors, a system ground, and the two CMP sensor signals is transferred between the PCM and the distributor through a shielded harness connected to the four-terminal connector on the distributor. The reference signals toggle between 0 and 5 volts as the camshaft turns. Therefore, an open circuit, a short to voltage, a short to ground, or a defective sensor inside the distributor can prevent the voltage from pulsing at the PCM.

6D4-2 IGNITION SYSTEM

The ignition coil/ignition control module provides spark to the distributor, timed by signals from the PCM. Power (B+) for the ignition coil primary circuit and the ignition control module is supplied through the ignition switch. The PCM combines the camshaft position information supplied by the distributor with other system parameters and calculates the required spark advance. The PCM signals the ignition control module, which turns on the primary current to the ignition coil by grounding the primary circuit, and then turns it off by removing the ground. When the primary current flow stops, high voltage induced in the ignition coil secondary winding becomes the spark voltage for the spark plug. The spark voltage is delivered to the distributor through the coil output (secondary) wire, and then directed to the proper spark plug connector by the distributor rotor. For more information, refer to SECTION 6E3.

SPARK PLUG WIRE HARNESSES

The spark plug wire harnesses use carbon impregnated cord conductors, encased in 8 mm (5/16-inch) diameter silicone jackets. The silicone jackets withstand very high temperatures and also provide excellent insulation for the high voltage of the system. Silicone spark plug boots form a tight seal to the spark plugs.

SPARK PLUGS

Figure 1

Platinum-tipped, resistor-type, tapered-seat spark plugs are used on the engine. No gasket is used on these tapered-seat spark plugs. For spark plug type and gap size, refer to SPECIFICATIONS in this section. When replacing spark plugs, use only the type specified. It is important that technicians wash their hands after handling coated spark plugs and before smoking. The coating itself is a nonhazardous material and incidental contact will not cause any adverse affects. However, exposure to polymer vapors (the result of a cigarette being coated from handling, then burned) may cause flu like symptoms and should be avoided. Normal service is assumed to be a mixture of idling, slow speed, and high speed driving. Occasional or intermittent high-speed driving is needed for good spark plug performance. It gives increased combustion heat, burning away carbon or oxides that have built up from frequent idling, or continual stop-and-go driving.

IGNITION SWITCH

The mechanical key and lock cylinder ignition switch is located in the steering column on the right-hand side, just below the steering wheel. The electrical switching portion is separate from the key and lock cylinder. However, both are synchronized and work in conjunction through the action of the actuator rod. For a complete explanation of the key and lock cylinder, and the actuator rod, refer to SECTION 3F5A or 3F5B. For electrical switching information, refer to SECTION 8A.

Figure 1 - Spark Plug Identification

KNOCK SENSOR SYSTEM

The knock sensor system retards the spark advance when detonation occurs. Further information is found in SECTION 6E3.

IGNITION TIMING

The base timing is preset when the engine is manufactured, no adjustment is possible. Timing advance and retard are accomplished through the PCM with ignition control and knock sensor systems.

DIAGNOSIS

IGNITION SYSTEM

Diagnosis for the ignition system is in SECTION 6E3.

SPARK PLUGS

Worn or dirty spark plugs may give satisfactory operation at idling speed, but frequently fail at higher rpm. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance services recommendations given in SECTION 0B, to assure satisfactory spark plug performance. Normal spark plug operation will result in brown to grayish-tan deposits appearing on the portion of the spark plug that projects into the cylinder area. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Engines which are not running properly are often referred to as "misfiring." This means the ignition spark is not igniting the fuel/air mixture at the proper time. While other ignition and fuel system causes must also be considered, possible causes include ignition system conditions which allow the spark voltage to reach ground in some other manner than by jumping across the air gap at the tip of the spark plug, leaving the fuel/air mixture unburned. Refer to SECTION 6E3.

Misfiring may also occur when the tip of the spark plug becomes overheated and ignites the mixture before the spark jumps. This is referred to as "pre-ignition."

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Over-rich fuel mixtures or poor ignition system output may also be the cause. Refer to SECTION 6E3 for diagnosis. Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder. This may be caused by oil getting past worn piston rings. This condition also may occur during break-in of new or newly overhauled engines. Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by-products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug that was facing the intake valve. Cracked or broken insulators may be the result of improper installation or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, or when the spark plug is hit from the outside. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.

A broken or cracked lower insulator tip (around the center electrode) may result from "heat shock" (spark plug suddenly operating too hot). "Heat shock" breakage in the lower insulator tip generally occurs during severe engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack. Damage during gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When gapping a spark plug, make the adjustment by only bending the ground side terminal, keeping the tool clear of other parts.

SPARK PLUG WIRE HARNESSES

Inspect spark plug wires visually first for any cuts, burns, or damage. While engine is running, inspect for any arcing to ground or other components. Use a spray bottle to lightly coat the spark plug wires with water while observing idle quality. If idle quality diminishes or engine stalls, spark plug wires should be replaced.

ON-VEHICLE SERVICE

SERVICE PRECAUTIONS

- Allow engine to cool before removing spark plugs. Attempting to remove spark plugs from a hot engine may cause spark plugs to seize, causing damage to cylinder head threads.
- Clean spark plug recess area before removing spark plug. Failure to do so can result in engine damage due to dirt or foreign material entering cylinder head, or in contamination of cylinder head threads. Contaminated threads may prevent proper seating of new spark plug.
- Use only the spark plug specified in SECTION 0B. Spark plug gap must be checked using a "wire-type" gauge before installing into engine. Refer to SECTION 0B for correct gap.
- The tachometer terminal must never be allowed to touch ground, as damage to the PCM and/or ignition coil can result.
- The material used to construct spark plug wires is very soft. This wire will withstand more heat and carry a higher voltage, but chaffing and cutting become easier. The spark plug wires must be routed correctly to prevent chaffing or cutting. See "Spark Plug Wire Harness Replacement" in the following procedure, for routing. When removing a spark plug wire from a spark plug, twist the boot on the spark plug one-half turn while pulling on the boot.

SPARK PLUG WIRE HARNESS REPLACEMENT

Figures 2 through 5

NOTICE: The boots should be twisted one-half turn while removing. Do not pull on the wire harnesses to remove them from the spark plugs. Pull on the boots, or use a tool designed for this purpose.

Remove or Disconnect

1. Left bank spark plug wire boots from spark plugs.
2. Left bank spark plug wire harness support channel bolts/screws (19) and channel.
 - Rear bolt/screw (19) is located behind exhaust manifold takedown. Loosen this bolt/screw using a 10 mm wrench, then slide channel upward to disengage from bolt/screw (19).
3. Left bank spark plug wire harness from clip (17) located behind air pump.
4. Right bank spark plug wire boots from spark plugs.
5. Air intake resonator if vehicle is equipped with a mechanical cooling fan. Refer to SECTION 6E3.
6. Upper radiator fan shroud, if vehicle is equipped with a mechanical cooling fan. Refer to SECTION 6B.

6D4-4 IGNITION SYSTEM

Figure 2 - Spark Plug Wire Harness (Left Side)

7. Loosen fan pulley nuts if vehicle is equipped with a mechanical cooling fan.
8. Fan belt if vehicle is equipped with a mechanical cooling fan.
9. Mechanical fan and pulley, if equipped.
10. Mechanical fan pulley bracket nuts and bracket.
11. Radiator outlet pipe nuts from A/C compressor mounting studs, if vehicle is equipped with a mechanical fan.
12. Serpentine drive belt.
13. Raise and suitably support vehicle. Refer to SECTION 0A.
14. Transmission oil cooler line support bolt/screw from accessory drive bracket.
15. Serpentine drive belt tensioner bolts/screws and tensioner.
16. A/C compressor attaching bolts/screws and rear bracket nut.
 - Reposition A/C compressor to provide access to front wire harness support (27).
17. Right wire harness support bolt/screw (28).
18. Right wire harness from support (27).

19. Left and right bank spark plug wire harnesses (6) from distributor.
20. Left wire harness from clips (17, 20, 21, and 23).
 - Insert screwdriver into tab on top of clip to disengage.
21. Right wire harness from clips (16, 17, and 21).
 - Insert screwdriver into tab on top of clip to disengage.

Install or Connect

NOTICE: Refer to "Notice" on page 6D4-1 of this section.

NOTICE: When replacing spark plug wires (secondary wiring), route the wire harnesses correctly through the proper retainers. Failure to route the wire harnesses properly can lead to radio ignition noise and cross-firing of the spark plugs, or shorting of the leads to ground.

1. Right wire harness to clips (16, 17, and 21).
2. Left wire harness to clips (17, 20, 21, and 23).
3. Right wire harness to support (27).

Figure 3 - Spark Plug Wire Harness (Right Side)

4. Right wire harness support bolt/screw (28).

Tighten

- Bolt/screw (28) to 40 N.m (30 lb. ft.).

5. A/C compressor to bracket.

6. A/C compressor attaching bolts/screws and rear bracket nut.

Tighten

- A. A/C compressor bolts/screws to 50 N.m (37 lb. ft.).
- B. A/C compressor rear bracket nut to 41 N.m (30 ft. ft.).

7. Serpentine drive belt tensioner and tensioner bolts/screw.

Tighten

- Tensioner bolts/screws to 25 N.m (18 lb. ft.).

8. Transmission oil cooler line support bolt/screw.

Tighten

- Oil cooler line support bolt/screw to 1.9 N.m (17 ft. lb.).

9. Lower vehicle.

10. Serpentine drive belt.

11. Radiator outlet pipe nuts, if removed.

Tighten

- Radiator outlet pipe nuts to 16 N.m (12 lb. ft.).
12. Mechanical fan pulley bracket nuts, if removed.

Tighten

- Mechanical fan pulley bracket nuts to 50 N.m (37 ft. lb.).
13. Mechanical fan pulley, fan and nuts, if removed.

- Finger tighten nuts.
14. Mechanical fan belt, if removed.

6D4-6 IGNITION SYSTEM

Figure 4 - Spark Plugs

Tighten

- Mechanical fan nuts to 26 N·m (19 lb. ft.).
- 15. Upper radiator fan shroud, if removed, Refer to SECTION 6B.
- 16. Air intake resonator, if removed. Refer to SECTION 6E3.
- 17. Right bank spark plug wire boots to spark plugs.
- 18. Left bank spark plug harness to clip (17) located behind air pump.
- 19. Left bank spark plug wire harness support channel and bolts/screws (19).
 - Rear bolt/screw (19) is located behind exhaust manifold takedown. Slide channel onto bolt/screw (19) then tighten using a 10 mm wrench.
- 20. Left bank spark plug wire harness boots to spark plugs.

SPARK PLUGS

Figures 2 through 5

CAUTION: If you smoke while handling coated spark plugs, wear gloves to prevent transfer of the coating to cigarettes and subsequent burning of the coating. Wash hands after installing spark plugs.

Remove or Disconnect

1. Be sure ignition switch is in "OFF" or "LOCK" position.
2. Spark plug wire harness from spark plugs. Refer to "Spark Plug Wire Harness Replacement" in this section.
 - Note positions of wires before removing.

1 DISTRIBUTOR, IGNITION

02-07-95
BS0056D4

Figure 5 - Spark Plug Wire Harness Routing

! Important

- Clean dirt and debris from spark plug recess areas.

3. Spark plugs from cylinder head.

→→ Install or Connect

NOTICE: Be sure spark plugs thread smoothly into cylinder head and are fully seated. Cross-threading or failing to fully seat spark plugs can cause overheating of spark plugs, exhaust blow-by, or thread damage. Follow recommended torque specifications carefully. Over or under-tightening can also cause severe damage to cylinder head or spark plugs.

! Important

- Check spark plug gap using a wire type gauge before installing. If spark plug gaps are not adjusted correctly, engine idle quality may be

seriously affected. A wire type gauge must be used (as opposed to a flat feeler type gauge) to insure an accurate reading. Refer to "Specifications" at the end of this section for correct spark/plug type and gap.

1. Spark plugs to cylinder head.

⌚ Tighten

- Spark plugs to 30 N.m (22 lb. ft.) with new head installation.
 - Spark plugs to 20 N.m (15 lb. ft.) with existing engine assembly.
2. Spark plug wire harness, routed properly as note during removal. Refer to "Spark Plug Wire Harness Replacement" in this section.

DISTRIBUTOR VENTILATION SYSTEM**Figure 6**

The ventilation system vacuum harness (24), connected to the air intake duct (25), the distributor (1) and the air intake manifold (26), provides

6D4-8 IGNITION SYSTEM

Figure 6 - Distributor Assembly Ventilation System

ventilation to the distributor (1), thus preventing moisture build-up and possible ignition system failure. A check valve at the air intake duct connection insures one-way flow through the distributor (1) to the air intake manifold (26), refer to Figure 6 for correct orientation. The ventilation system vacuum harness (24) connects to the air intake duct (25) and the air intake manifold (26) with vacuum fittings. It attaches to the distributor (1) at two places with separately sized connectors. In the case of ignition system failure, check vacuum harness (24) for proper hook-up and/or kinks. If OK, check the ventilation system for a possible restriction before removing the distributor (1). Disconnect the vacuum harness (24) at the air intake duct (25) and check for vacuum using a vacuum gauge. The gauge needle should slowly move towards manifold vacuum. If no vacuum is present, replace the vacuum harness (24). Once it has been determined that the ventilation system vacuum harness is functioning properly, disconnect the vacuum hose to the air intake duct. Running the engine with manifold vacuum present in the distributor may lead to engine misfire.

Important

- Failure to connect all hoses of the ventilation system will eventually result in distributor failure.

DISTRIBUTOR

Figures 6 and 7

Remove or Disconnect

1. Check the distributor ventilation system for proper operation. Refer to "Distributor Ventilation System" in this section.
2. Be sure ignition switch is in the "OFF" or "LOCK" position.
3. Water pump. Refer to SECTION 6A4A.
4. Crankshaft balancer. Refer to SECTION 6A4A.

Figure 7 - Distributor Mounting

! Important

- Make sure all coolant has been wiped off distributor and surrounding area before disconnecting any electrical connectors or spark plug wire harness.
- 5. Spark plug wire harness from distributor (1). Refer to "Spark Plug Wire Harness Replacement" in this section.
- 6. Four-terminal PCM connector from distributor (1).
- 7. Vacuum harness (24) from distributor (1). Refer to "Distributor Ventilation System" in this section.
- 8. Distributor bolts/screws (3).
- 9. Distributor (1).
 - Pull distributor forward until coupling (4) disengages from end of camshaft.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6D4-1 of this section.

! Important

- Replace the O-Rings on the coupling shaft or ignition system performance may be affected.
- Lubricate O-Rings and end of camshaft with GM lubricant P/N 9985007, or equivalent.
- 1. Distributor (1) with new coupling shaft "O" rings.

- A. Rotate distributor coupling until camshaft sprocket pin slot aligns with camshaft sprocket pin.
- B. Slide distributor (1) onto end of camshaft until fully seated on engine front cover.

! Important

- Do not attempt to fully seat distributor (1) using bolts/screws (3). If distributor (1) will not seat by hand, it is not properly aligned with camshaft. Rotate crankshaft until engine is at number 1 cylinder TDC (camshaft sprocket pin at the 9 o'clock position). Rotate the distributor coupling (4) until the camshaft sprocket pin slot aligns with the distributor base timing mark. Install distributor (1) using hand pressure to fully seat.
- 2. Distributor bolts/screws (3).

⚙ Tighten

- Bolts/screws (3) to 12 N.m (106 lb. in.).
- 3. Four-terminal PCM connector to distributor (1).
- 4. Vacuum harness (24) to distributor (1). Refer to "Distributor Ventilation System" in this section.
- 5. Spark plug wire harness to distributor (1). Refer to "Spark Plug Wire Harness Replacement" in this section.
- 6. Crankshaft balancer. Refer to SECTION 6A4A.
- 7. Water pump. Refer to SECTION 6A4A.

DISTRIBUTOR CAP, COVER, ROTOR, AND BASE

Figure 8

Tools Required:

- J 39997 Ignition Distributor Cap Socket
- J 39998 Ignition Distributor Rotor

NOTICE: The distributor and timing disk must be kept clean and free of oil, dirt and engine coolant. Any contamination may lead to engine misfire and distributor damage. Do not disassemble the distributor until all coolant has been cleaned from the distributor and surrounding area.

Remove or Disconnect

1. Water pump and crankshaft balancer. Refer to SECTION 6A4A.
2. Spark plug wire harness from distributor.
3. Four-terminal PCM connector from distributor.
4. Vacuum harness from distributor.

5. Distributor cap bolts/screws (29) using J 39997 or equivalent.
6. Distributor cap (30).
7. Rotor bolts/screws (32) using J 39998 or equivalent.
8. Rotor (32).
9. Distributor cover (33) and shield (34).

Important

- Do not touch timing disk, sensor or distributor base.

Inspect

- Distributor base and timing disk, for damage, corrosion or plastic particles. If any are present replace entire distributor.

Install or Connect

1. Shield (34) and distributor cover (33).
2. Rotor (32).

Figure 8 - Distributor Cap, Cover, Rotor and Base

3. Rotor bolts/screws (31) using J 39998 or equivalent.

Tighten

3. Ignition control module (11).

**Assemble**

NOTICE: Refer to "Notice" on page 6D4-1 of this section.

NOTICE: A package of silicone grease is included with a new ignition control module. This grease is necessary for ignition control module cooling.

1. Spread silicone grease on metal face of ignition control module (11) and on bracket (13) where it seats, and position ignition control module (11) to bracket (13).
2. Bolts/screws (12).

**Tighten**

- Bolts/screws (12) to 1.7 N.m (15 lb. in.).
3. Coil (10) to brackets (13 and 14) using bolts/screws provided with replacement coil (10).

**Tighten**

- Bolts/screws to 2.8 N.m (25 lb. in.).

SECTION 6D5

ENGINE WIRING

NOTICE: This vehicle uses a sequential multiport fuel injected engine. Fuel injector connectors must be positioned onto their appropriate fuel injectors or engine performance and exhaust emissions may be seriously affected. Fuel injector connectors are numbered to match their correct fuel injector for that cylinder. If fuel injector connector numbers can not be identified, refer to SECTION 8A-20 for correct fuel injector connector wire color to fuel injector for each cylinder.

SECTION 6F

EXHAUST SYSTEM

NOTICE: All new GM vehicles are certified by the United States Environmental Protection Agency as conforming to the requirements of the regulations for the control of air pollution from new motor vehicles. This certification is contingent on certain adjustments being set to factory standards, thus, these adjustment points either have been permanently sealed and/or made inaccessible to prevent indiscriminate adjustment in the field. For this reason, the factory procedure for temporarily removing plugs, caps, etc., for the purpose of servicing the product must be strictly followed and, where practical, returned to the original intent of the design.

NOTICE: Exhaust system components must have enough clearance from the underbody to prevent overheating of the floor panel and possible damage to the passenger compartment, insulation and trim materials.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

NOTICE: When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating of the floor panel and possible damage to the passenger compartment, insulation and trim materials.

The 4.3L L99 engine used in the Chevrolet has a single exhaust system with dual warmup three way catalytic converters. The 5.7L LT1 engine used for

both Chevrolet and Buick has a dual exhaust system with dual warmup three way catalytic converters.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for service, it is advisable to check the condition of the complete exhaust system.

Check complete exhaust system, nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration that could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may indicate a problem in

6F-2 EXHAUST SYSTEM

one of these areas. Any faulty areas should be corrected immediately. To help ensure continued integrity, the exhaust system pipes rearward of the exhaust muffler must be replaced whenever a new exhaust muffler is installed.

WARMUP THREE WAY CATALYTIC CONVERTER

Figure 1

CAUTION: Prolonged operation with a misfiring or flooded engine may cause the warmup three way catalytic converters to overheat. This could cause damage either to the catalyst itself or the operating vehicle and possible personal injury.

The warmup three way catalytic converters are emission control devices added to the exhaust system to reduce pollutants from the exhaust gas stream.

NOTICE: The warmup three way catalytic converters require the use of unleaded fuel only, or damage to the catalyst may result.

A dual catalytic converter system is used. This type of catalytic converter is known as a warmup three way catalytic converter.

The catalysts have coatings that contain platinum and rhodium. The three way catalyst lowers the levels of oxides of nitrogen (NO₃) as well as hydrocarbons (HC) and carbon monoxide (CO).

EXHAUST MUFFLER

The exhaust muffler is a tri-flow design. The exhaust muffler has a slot in the outlet pipe that indexes to a key (tab) welded on the exhaust resonator inlet to help maintain alignment.

HANGERS

! Important

- The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations that can be difficult to diagnose.

Two types of hangers are used. The first uses a rigid metal brace that is attached to the transmission housing and solidly bolted to both right and left sides of the exhaust system. A vibration dampener is installed at the right-hand side attachment. Cracking of the catalytic converters may occur if the brace and dampener are not installed.

The second type of hanger uses a pair of molded rubber insulators pierced by four metal rods. Two of the rods are from the exhaust system component being supported by the hanger. These rods pierce the lower holes of the insulators. The other two rods that pierce the upper holes of the insulators are on the chassis-mounted hanger bracket.

CLAMPS AND CONNECTIONS

CAUTION: Coat slip joints with exhaust system sealer before assembly to prevent exhaust from entering the vehicle and causing personal injury.

Three methods are used for connecting exhaust system components: U-bolt type clamps, bolt and cup fittings and flange-to-flange fittings.

Before attaching exhaust system components together, all mating surfaces must be clean and in good condition. Flange-to-flange fittings are the only fittings that require gaskets.

EXHAUST RESONATOR

The resonator allows the use of mufflers with less back pressure and provides for best exhaust system tuning characteristics. Dual exhaust systems use two resonators and single exhaust systems use one resonator. The resonators and tailpipes are serviced as an assembly.

DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
Leaking Exhaust Gases.	Leaks at pipe joints.	Tighten nuts/bolts at leaking joints to specifications.
Exhaust Noises.	1. Exhaust pipes contacting heat shields, or loose heat shields. Inspect when cold and after warmup. 2. Leaks at manifold or pipe connections. 3. Burned or blown out exhaust muffler. 4. Burned or rusted out exhaust pipe. 5. Leaking exhaust pipe at manifold flange. 6. Cracked or broken exhaust manifold. 7. Leak between manifold and cylinder head.	1. Tighten heat shield bolts/screws to 1.9 N·m (17 lb. in.). Align exhaust system if necessary. 2. Tighten clamps at leaking connections to specifications. 3. Replace exhaust muffler. 4. Replace exhaust pipe. 5. Replace gasket. 6. Replace manifold. 7. Tighten manifold-to-cylinder head stud nuts or bolts/screws to specifications.
Exhaust Vibrations.	1. Exhaust component contacting body component. 2. Exhaust vibration dampener loose, damaged or missing. 3. Exhaust pipes contacting heat shields.	1. Loosen clamps and realign exhaust system. 2. Tighten or replace exhaust vibration dampener. 3. Loosen clamps and realign exhaust system.
Loss of Engine Power and/or Internal Rattles in Muffler or Catalytic Converters.	Dislodged turning tubes and/or baffles in muffler, cracked or melted substrate in catalytic converter or exhaust pipe.	Replace muffler, catalytic converter, or exhaust pipe.

ON-VEHICLE SERVICE

COMPONENT REPLACEMENT

Exhaust system service includes replacement of the following items:

- Warmup three way catalytic converter.
- Exhaust muffler with crossover pipe (single exhaust).
- Exhaust muffler with intermediate pipe (dual exhaust).
- Exhaust resonator (with tailpipe).
- Catalytic converter hanger and exhaust muffler vibration dampener.
- Exhaust tailpipe front hanger.
- Exhaust resonator rear hanger.

- Complete exhaust system.
- Catalytic converter heat shield.
- Exhaust muffler heat shield.
- Fuel tank heat shields.

WARMUP THREE WAY CATALYTIC CONVERTER

Figures 1 and 3

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Heated oxygen sensor. Refer to SECTION 6E3.
3. Muffler bolts/screws (3).

6F-4 EXHAUST SYSTEM

4. Converter hanger bolts/screws (4) from converter (9) (right-hand only).
5. Dampener (7) (right-hand only).
6. Bolts/screws (53) (left-hand only).
7. Dampener (54) (left-hand only).
8. Nuts (8) from manifold studs.
9. Converter (9 or 10).
10. Gasket (11).

Clean

- Gasket sealing surfaces.

Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. New gasket (11).
2. Converter (9 or 10).
3. Converter nuts (8), loosely.
4. Dampener (54) (left-hand only).
5. Bolts/screws (53) (left-hand only).

Tighten

- 41 N.m (30 lb. ft.).
6. Insert converter hanger bolts/screws (4) through dampener (7) and converter support (5) (right-hand only) into converter (9).
 7. Finger tighten converter hanger bolts/screws (4) into converter (9) (right-hand only).
 8. Loosely install muffler bolts/screws (3).

Tighten

- A. Nuts (8) to 50 N.m (37 lb. ft.).

- B. Converter hanger bolts/screws (4) to 34 N.m (25 lb. ft.). Ensure bottom edge of dampener is horizontal (right-hand only).

- C. Muffler bolts/screws (3) to 20 N.m (15 lb. ft.).

9. Heated oxygen sensor. Refer to SECTION 6E3.

10. Lower vehicle.

EXHAUST MUFFLER (WITH INTERMEDIATE PIPE)

CHEVROLET WITH 4.3L L99 ENGINE

Figures 1, 5, and 6

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Clamp (16).
3. Resonator rods from insulators (17).
4. Resonator (59) from muffler (2).

Important

- Ensure resonator pipe does not hang on axle, otherwise brake line on axle may be damaged.

5. Support resonator (59).
6. Exhaust muffler bolts/screws (3).
7. Muffler rods from insulators (19).
8. Muffler (2) with intermediate pipe.

Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Muffler (2) with intermediate pipe.

6F-6 EXHAUST SYSTEM

Figure 5 - Exhaust System Rear Portion (Chevrolet with 4.3L L99 Engine)

2. Muffler rods into insulators (19).
3. Exhaust muffler bolts/screws (3), loosely.
4. Resonator (59) into muffler (2).
 - Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
5. Resonator rods into insulators (17).
6. Clamp (16).
 - A. Assemble clamp around resonator pipe and loosely install nuts.
 - B. Tap clamp (16) rearward to contact tab on resonator.

Tighten

- A. Exhaust muffler bolts/screws (3) to 20 N·m (15 lb. ft.).
- B. Clamp nuts to 35 N·m (26 lb. ft.).
7. Lower vehicle.

5.7L LT1 ENGINE

Figures 4, 6, and 7

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Clamp (16).
3. Resonator rods from insulators (17).
4. Resonator (18 or 20) from muffler (14 or 15).

Important

- Ensure resonator pipe does not hang on axle, otherwise brake line on axle may be damaged.
5. Support resonator (18 or 20).
 6. Exhaust muffler bolts/screws (3).

Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Muffler (14 or 15) with intermediate pipe into position.
2. Muffler rods into insulators (19).
3. Exhaust muffler bolts/screws (3), loosely.
4. Resonator (18 or 20) into muffler (14 or 15).
 - Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
5. Resonator rods into insulators (17).
6. Clamp (16).
 - A. Assemble clamp around resonator pipe and loosely install nuts.
 - B. Tap clamp (16) rearward to contact tab on resonator.

Tighten

- A. Exhaust muffler bolts/screws (3) to 20 N·m (15 lb. ft.).
- B. Clamp nuts to 35 N·m (26 lb. ft.).
7. Lower vehicle.

EXHAUST RESONATOR (WITH TAILPIPE) CHEVROLET WITH 4.3L L99 ENGINE

Figures 5 and 6

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.

2. Clamp nuts and clamp (16).
3. Resonator rods from insulators (17).
4. Resonator (59) from muffler (2).

! Important

- Carefully lift resonator pipe over axle to prevent damaging brake line on axle.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Resonator (59) into muffler (2).
 - Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
2. Resonator rods into insulators (17).
3. Clamp (16) and nuts.
 - A. Assemble clamp around resonator pipe and loosely install nuts.
 - B. Tap clamp (16) rearward to contact tab on resonator.

⌚ Tighten

- Exhaust muffler clamp nuts on clamp to 35 N.m (26 lb. ft.).
4. Lower vehicle.

Figure 6 - Exhaust Resonator Rear Hanger (Right Hand Shown; Left Hand, if Equipped, Reversed)

5.7L LT1 ENGINE

Figures 6 and 7

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Ground strap nut (53) and bolt/screw (54) from right-hand resonator outlet for police vehicles only.
3. Clamp (16).
4. Resonator rods from insulators (17).
5. Resonator (18 or 20) from muffler (14 or 15).

! Important

- Carefully lift resonator pipe over axle to prevent damaging brake line on axle.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Resonator (18 or 20) onto muffler (14 or 15).
 - Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
2. Resonator rods into insulators (17).
3. Clamp (16).
 - A. Assemble clamp around resonator pipe and loosely install nuts.
 - B. Tap clamp (16) rearward to contact tab on resonator.

⌚ Tighten

- Nuts on clamp (16) to 35 N.m (26 lb. ft.).
4. Bolt/screw (54) through right-hand resonator outlet and ground strap, on police vehicles only.
 5. Nut (53), for police vehicles only.

⌚ Tighten

- Ground strap nut (53) to 6 N.m (53 lb. in.), on police vehicles only.
6. Lower vehicle.

CATALYTIC CONVERTER SUPPORT AND EXHAUST MUFFLER VIBRATION DAMPENERS

Figures 2 and 3

! Important

- Catalytic converter hanger bracket can not be separated from exhaust piping without damage to piping or bracket.

6F-8 EXHAUST SYSTEM

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Transmission support crossmember. Refer to SECTION 7A.
3. Bolts/screws (4) with washers (6).
4. Dampener (7).
5. Converter support (5).
6. Bolts/screws (53).
7. Dampener (54).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Dampener (54).
2. Bolts/screws (53).

⌚ Tighten

- Bolts/screws (53) to 41 N.m (30 lb. ft.).
 - Ensure bottom edge of dampener is horizontal.
3. Two bolts/screws (4) with washers (6) loosely securing support (5) to transmission case.
 4. Two bolts/screws (4), loosely securing hanger bracket to support (5).
 5. Two bolts/screws (4), loosely securing dampener to support (5) and right-hand converter (9).

⌚ Tighten

- Bolts/screws (4) to 34 N.m (25 lb. ft.).
 - Ensure bottom edge of dampener (7) is horizontal.
6. Transmission support crossmember. Refer to SECTION 7A.
 7. Lower vehicle.

EXHAUST TAILPIPE FRONT HANGER

Figure 8

↔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (21).
3. Hanger bracket (22 or 26) with insulators (19) from rear crossmember.
4. Insulators (19) from muffler rods.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Insulators (19) onto bracket (22 or 26) by inserting bracket rods through upper holes in insulator.

Figure 7 - Exhaust System Rear Portion (5.7L LT1 Engine)

2. Insulator (19) with bracket (22 or 26) onto muffler rods.
3. Bracket (22 or 26) onto rear crossmember.
4. Bolts/screws (21).

Tighten

- Bolts/screws (21) to 50 N.m (37 lb. ft.).
5. Lower vehicle.

EXHAUST RESONATOR REAR HANGER

Figure 6

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (23).

3. Converter nuts (8), loosely.
4. Converter support (5) to underside of transmission case.
5. Only those two converter hanger bolts/screws (4) with washers (6) that attach converter support (5) to transmission case.

Tighten

- Converter hanger bolts/screws (4) to 34 N.m (25 ft. lb.).
6. Dampener (7).
 7. Only those two converter hanger bolts/screws (4) securing dampener (7) and support (5) onto converter (9), loosely.

Tighten

- A. Converter nuts (8) to 50 N.m (37 lb. ft.).
- B. Hanger bolts/screws (4) to 34 N.m (25 lb. ft.).
 - Ensure bottom edge of dampener (7) is horizontal.
8. Transmission support crossmember. Refer to SECTION 7A.
9. Front tailpipe hanger bracket rods into upper holes of insulators (19).
10. Insulators (19) with hanger bracket (22) onto muffler rods.
11. Hanger bracket (22) to rear crossmember.
12. Hanger bracket bolts/screws (21), loosely.
13. Muffler (2) with crossover pipe to converters (9 and 10).
14. Muffler bolts/screws (3), loosely.
15. Dampener (54).
16. Bolts/screws (53), loosely.
17. Resonator rear hanger bracket (24) to rear frame rail.
18. Resonator rear hanger bracket bolts/screws (23).

Tighten

- A. Tailpipe front hanger bracket bolts/screws (21) to 50 N.m (37 lb. ft.).
 - B. Resonator rear hanger bracket bolts/screws (23) to 17 N.m (13 lb. ft.).
19. Muffler clamp (16) onto muffler outlet.
 20. Resonator (57 or 59).
 - A. Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
 - B. Insulators (17) onto rear hanger bracket (24).
 - Insert bracket rods through upper holes in insulators (17).
 - C. Resonator rods into lower holes in insulators (17).
 - D. Tap muffler clamp (16) rearward to contact tab on resonator.

Tighten

- A. Nuts on clamp (16) to 35 N.m (26 lb. ft.).
 - Ensure clamp U-bolt is positioned with threaded ends pointed outboard.
 - B. Muffler bolts/screws (3) to 20 N.m (15 lb. ft.).
 - C. Dampener bolts/screws (53) to 41 N.m (30 lb. ft.).
 - Ensure bottom of dampener is horizontal.
21. Position converter hanger bracket and clamp (16) (part of crossover pipe) to front face of converter support (5).
 22. Remaining two converter hanger bolts/screws (4).

Tighten

- A. Converter hanger bolts/screws (4) to 34 N.m (25 lb. ft.).
 - B. Converter hanger bracket and clamp nut to 35 N.m (26 lb. ft.).
23. Heated oxygen sensor. Refer to SECTION 6E3.
 24. Lower vehicle.

5.7L LT1 ENGINE

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Muffler clamp (16).
3. Rear hanger bracket bolts/screws (23).
4. Resonator (18 and 20) with insulators (17) and bracket (24 and 25) from muffler outlet.

Important

- Ensure resonator pipe does not hang on axle, otherwise brake line on axle may be damaged.
5. Support intermediate pipes (12 and 13).
 6. Bolts/screws (53).
 7. Dampener (54).
 8. Muffler bolts/screws (3).
 9. Only those two converter support bolts/screws (4) attaching support bracket to converter support (5).
 10. Right hand tailpipe front hanger bracket bolts/screws (21).
 11. Muffler (14) with intermediate pipe, insulators (19) and bracket (22), as an assembly.
 12. Two converter support bolt/screws (4) that attach support (5) to hanger bracket on intermediate pipe (13).
 13. Left-hand tailpipe front hanger bolts/screws (21).
 14. Muffler (15) with intermediate pipe, insulator (19) and bracket (26) as an assembly.
 15. Heated oxygen sensor. Refer to SECTION 6E3.
 16. Converter nuts (8).
 17. Converters (9 and 10).
 18. Gaskets (11).

19. Transmission support crossmember if removing converter support (5). Refer to SECTION 7A.
20. Remaining two converter support bolts/screws (4) and washers (6).
21. Converter support (5).

Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. New exhaust manifold outlet gaskets (11).
2. Converters (9 and 10).
3. Converter nuts (8), loosely.
4. Converter support (5) to underside of transmission case.
5. Converter support bolts/screws (4) with washers (6) that attach converter support (5) to transmission case.

Tighten

- Converter hanger bolts/screws (4) to 34 N.m (25 lb. ft.).
6. Dampener (7).
 7. Converter support bolts/screws (4) that attach dampener (7) and support (5) onto converter (9), loosely.

Tighten

- A. Converter nuts (8) to 50 N.m (37 lb. ft.).
- B. Converter hanger bolts/screws (4) to 34 N.m (25 lb. ft.).
8. Transmission support crossmember. Refer to SECTION 7A.
9. Front tailpipe hanger bracket rods into upper holes of insulators (19).
10. Insulators (19) with hanger bracket (22 and 26) onto muffler rods.
11. Right-hand hanger bracket (22) to rear crossmember.
12. Hanger bracket bolts/screws (21), loosely.
13. Muffler (14) with intermediate pipe to converter (9).
14. Left-hand hanger bracket (26) to rear cross member.
15. Hanger bracket bolts/screws (21) for left-hand bracket.

Tighten

- Front hanger bracket bolts/screws (21) to 50 N.m (37 lb. ft.).
16. Muffler (15) with intermediate pipe to converter (10).
 17. Muffler bolts/screws (3), loosely.
 - A. Tailpipe front hanger bracket bolts/screws (21) to 50 N.m (37 lb. ft.).
 - B. Resonator rear hanger bracket bolts/screws (23) to 17 N.m (13 lb. ft.).

18. Resonator rear hanger brackets (24 and 25) to rear frame rail.
19. Resonator rear hanger bracket bolts/screws (23) to 17 N.m (13 lb. ft.).

Tighten

- Rear hanger bracket bolts/screws (23) to 17 N.m (13 lb. ft.).
20. Muffler clamps (16) onto muffler outlets.
 21. Resonators (18 and 20).
 - A. Slide resonator pipe into muffler outlet until tab on resonator contacts bottom of slot on top of muffler outlet.
 - B. Insulators (17) onto rear hanger bracket (24 and 25).
 - Insert bracket rods through upper holes in insulators (17).
 - C. Resonator rods into lower holes in insulators (17).
 - D. Tap muffler clamps (16) rearward to contact tab on resonators.

Tighten

- A. Nuts on clamp (16) to 35 N.m (26 lb. ft.).
- B. Muffler bolts/screws (3) to 20 N.m (15 lb. ft.).
22. Dampener (54).
23. Bolts/screws (53).

Tighten

- A. Bolts/screws (53) to 41 N.m (30 lb. ft.).
- B. Ensure bottom edge of dampener (54) is horizontal.
24. Position converter support bracket and clamp (part of left-hand intermediate pipe (13) to front face of converter support (15).
25. Remaining two converter support bolts/screws (4).

Tighten

- A. Converter support bolts/screws (4) to 34 N.m (25 lb. ft.).
- B. Converter support bracket and clamp nut to 35 N.m (26 lb. ft.).
26. Heated oxygen sensor. Refer to SECTION 6E3.
27. Lower vehicle.

EXHAUST SYSTEM REALIGNMENT

Figures 1 through 7

Use the following procedure to realign the exhaust system:

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Loosen converter nuts (8). Do not remove.
3. Loosen muffler bolts/screws (3). Do not remove.

6F-12 EXHAUST SYSTEM

4. Loosen four converter support bolts/screws (4) that attach support (5) to converter (9) and support (5) to support bracket clamp on intermediate pipe (for 5.7L LT1 engine) or left leg of crossover pipe (for Chevrolet with 4.3L L99 engine).
5. Loosen converter support bracket clamp nut until bracket clamp can slide on left-hand intermediate pipe (for 5.7L LT1 engine) or on left leg of crossover pipe (for Chevrolet with 4.3L L99 engine). Do not remove.
6. Loosen muffler clamp nuts until clamp can slide on muffler outlet. Repeat for other side, if equipped.

Tighten

- A. Converter nuts (8) to 50 N.m (37 lb. ft.).
 - B. Only those two converter support bolts/screws (4) that secure dampener (7) to support (5) and converter (9) to 34 N.m (25 lb. ft.). Ensure bottom edge of dampener (7) is horizontal.
7. Tap muffler clamp (16) rearward to contact tab on resonator (right-hand only for Chevrolet with 4.3L L99 engine) (both right-hand and left-hand for 5.7L LT1 engine).

Tighten

- A. Muffler clamp nuts to 35 N.m (26 lb. ft.). Ensure clamp U-bolts are positioned with threaded ends pointed outboard.

- B. Muffler bolts/screws (3) to 20 N.m (15 lb. ft.).
8. Position converter support bracket (on left leg of crossover pipe on Chevrolet with 4.3L L99 engine or left hand intermediate pipe on 5.7L LT1 engine) to front face of converter support (5).

Tighten

- A. Remaining two converter support bolts/screws (4) that secure support bracket to support (5) to 34 N.m (25 lb. ft.).
- B. Converter support bracket clamp nut to 35 N.m (26 lb. ft.).
9. Lower vehicle.

CATALYTIC CONVERTER HEAT SHIELDS

Figure 9

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Converter heat shield bolts/screws (27) from converter heat shields (28 and 29).
3. Converter heat shields (28 and 29).

Install or Connect

NOTICE: Refer to "Notice" on page 6F-1 of this section.

Figure 9 - Catalytic Converter Heat Shields

- Converter heat shield bolts/screws (27) to 1.9 N·m (17 lb. in.).
3. Lower vehicle.

EXHAUST MUFFLER HEAT SHIELDS**Figure 10****Remove or Disconnect**

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Muffler heat shield bolts/screws (30) from right-hand muffler heat shield (31).
3. Right-hand muffler heat shield (31).
4. Muffler heat shield bolts/screws (30) from left-hand muffler heat shield (32).
5. Left-hand muffler heat shield (32).

**Install or Connect**

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Muffler heat shields (31 and 32).
2. Muffler heat shield bolts/screws (30).
 - Muffler heat shield bolts/screws (30) to 1.9 N·m (17 lb. in.).
3. Lower vehicle.

FUEL TANK, FUEL TANK FRONT, AND EXHAUST PIPE FRONT HEAT SHIELDS**SEDAN****Figures 11 and 12****Remove or Disconnect**

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (33) from right-hand fuel tank front shield (34).
3. Shield (34), if equipped.
4. Bolts/screws (33) from left-hand fuel tank front shield (35).
5. Shield (35), if equipped.
6. Bolts/screws (36 and 37) from right-hand exhaust pipe front heat shield (38) and right-hand fuel tank heat shield (40).
7. Connected shields (38 and 40) from underbody.
8. Bolts/screws (36 and 37) from left-hand exhaust pipe front heat shield (39) and left-hand fuel tank heat shield (41).
9. Connected shields (39 and 41) from underbody.
10. Bolts/screws (33) connecting shields (38 and 40) and (39 and 41).
11. Nuts (42) from shields (38 and 40) and shields (39 and 41).

**Install or Connect**

NOTICE: Refer to "Notice" on page 6F-1 of this section.

1. Nuts (42) to shields (38 and 40) and shields (39 and 41).

**Figure 10 - Exhaust Muffler Heat Shields**

SECTION 7

AUTOMATIC TRANSMISSION GENERAL INFORMATION

CONTENTS

General Description.....	7-1	Automatic Transmission Diagnosis	7-1
Section 7A - Automatic Transmission On-Vehicle Service.....	7-1	Unit Repair.....	7-1

GENERAL DESCRIPTION

Section 7 contains information on where to locate on-vehicle service, unit repair, and diagnostic procedures for the automatic transmission.

SECTION 7A - AUTOMATIC TRANSMISSION ON-VEHICLE SERVICE

Refer to SECTION 7A in this manual for on-vehicle service information. This section contains information on transmission identification, fluid level checking procedures and specific information on servicing some components while transmission is in the vehicle. This section also contains removal and installation of the transmission from the vehicle.

AUTOMATIC TRANSMISSION DIAGNOSIS

Refer to SECTION 7A-14A in this manual for diagnostic service information. This section contains information to assist in diagnosing automatic

transmission operating conditions when the unit is in the vehicle. The diagnosis covers: road test procedures, diagnosis charts, electrical wiring diagrams, automatic transmission oil passage identification, and torque converter clutch diagnosis.

For fluid-flow diagrams and circuit descriptions, refer to the Transmission/Transaxle/Transfer Case Unit Repair manual.

UNIT REPAIR

Refer to the Transmission/Transaxle/Transfer Case Unit Repair Manual. This manual contains the disassembly, inspection, overhaul and assembly procedures for the mechanical components in the transmission. Also included is information on the gaging of certain components, proper use of special tools, and torque specifications required for assembly.

SECTION 7A

AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

7A-2 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

GENERAL INFORMATION

TRANSMISSION IDENTIFICATION

Figures 1 and 2

The HYDRA-MATIC 4L60-E transmission is the only transmission available on the Chevrolet and Buick. All HYDRA-MATIC 4L60-E transmissions have a stamped identification number on the transmission oil pan rail. This is shown in Figure 1. The identification information will help in servicing the unit and ordering necessary parts through a GM parts catalog. The service parts identification label contains information on the regular production options (RPO) as well as standard and mandatory options. Refer to Figure 2. This label is affixed to the inside of each vehicle at the assembly plant. Refer to SECTION 0A for label location and additional information.

TRANSMISSION DEFINITIONS

The following definitions are provided to establish a common language and assist the user in describing transmission related conditions. Some of these terms or conditions are used in the transmission diagnosis section of this service manual.

Throttle Positions

Minimum Throttle - least amount of throttle opening required for an upshift.

Light Throttle - approximately 1/4 of accelerator pedal travel (25% throttle position).

Medium Throttle - approximately 1/2 of accelerator pedal travel (50% throttle position).

Heavy Throttle - approximately 3/4 of accelerator pedal travel (75% throttle position).

Wide Open Throttle - full travel of accelerator pedal (100% throttle position).

Full Throttle Detent Downshift - quick application of accelerator pedal to its full travel, forcing a downshift.

Zero Throttle Coastdown - full release of accelerator pedal while vehicle is in motion and in drive range.

Engine Braking - condition where engine is used to slow vehicle by manually downshifting during zero throttle coastdown.

Shift Conditions

Bump - sudden and forceful application of clutch or band.

Chuggle - bucking or jerking condition that may be engine related. May be most noticeable when the torque converter clutch is engaged. Similar to the feel of towing a trailer.

Delayed - condition where shift is expected but does not occur for a period of time. Samples of this condition could be described as clutch or band engagement that does not occur as quickly as expected during part throttle or wide open throttle application of accelerator, or when manually downshifting to lower range. Also defined as "late" or "extended."

10-3-94
 DS0047A

Figure 2 - Service Parts Identification Label

Double Bump - two sudden and forceful applications of clutch or band. Also defined as "double feel."

Early - condition where shift occurs before vehicle has reached proper speed and tends to labor engine after upshift.

End Bump - firmer feel at end of shift as compared to feel at start of shift. Also defined as "end feel" or "slip bump."

Firm - noticeable quick application of clutch or band that is considered normal with medium to heavy throttle shift. Should not be confused with "harsh" or "rough."

Flare - quick increase in engine RPM accompanied with momentary loss of torque. This most generally occurs during a shift. Also defined as "slipping."

Harsh - more noticeable application of clutch or band or as compared to "firm." This condition is considered undesirable at any throttle position. Also defined as "rough."

Hunting - repeating quick series of upshifts and downshifts causing noticeable change in engine RPM. An example could be described as a 4-3-4 shift pattern. Also defined as "busyness."

Initial Feel - distinct firmer feel at start of shift as compared to finish of shift.

Late - shift that occurs when engine is at higher than normal RPM for given amount of throttle.

Shudder - repeating jerking sensation similar to "chuggle" but more severe and rapid in nature. This condition may be most noticeable during certain ranges of vehicle speed. May also be used to define the condition after torque converter clutch engagement.

Slipping - noticeable increase in engine RPM without vehicle speed increase. Slip usually occurs during or after initial clutch or band apply.

Soft - slow, almost unnoticeable clutch application with very little shift feel.

Surge - repeating engine related feeling of acceleration and deceleration that is less intense than "chuggle."

Tie-Up - condition where two opposing clutches are attempting to apply at the same time causing the engine to labor with noticeable loss of engine RPM.

Noise Conditions

Gear Noise - whine, most noticeable in first gear and reverse that is related to vehicle speed. A gear noise condition may become less noticeable or go away after an upshift.

Pump Noise - high pitched whine increasing in intensity with engine RPM. This condition may also be noticeable in "PARK" and "NEUTRAL" operating ranges with the vehicle stationary.

PRELIMINARY CHECKING PROCEDURE

Transmission performance may be influenced by one or more of the following items. These items should be checked and corrected if necessary, before attempting transmission diagnosis.

- High or low fluid level.
- Manual linkage adjustment.
- Perform "Functional Test Procedure." Refer to SECTION 7A-14A.

NOISE AND VIBRATION ANALYSIS

A noise or vibration noticeable when the vehicle is in motion may not be caused by the transmission. If a noise or vibration is noticeable in "PARK" and "NEUTRAL" with engine at idle, but is less noticeable as RPM increases, the cause may be poor engine performance or misfire. Other possible causes of noises or vibrations may be related to any one of the following:

Inspect

- Tires and wheels for:
 - A. Uneven wear.
 - B. Imbalance.
 - C. Mixed sizes.
 - D. Stones or debris lodged in tread
- Suspension components for:
 - A. Alignment and wear.
 - B. Loose fasteners. Refer to SECTION 3C.
- Engine and transmission mounts for:
 - A. Damage.
 - B. Loose bolts.
- Transmission case mounting holes for:
 - A. Missing bolts, nuts, studs.
 - B. Stripped threads.
 - C. Cracks.

7A-4 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

- Flywheel for:
 - A. Missing or loose bolts.
 - B. Cracks.
 - C. Imbalance.
- Torque converter clutch for:
 - A. Missing or loose bolts or lugs.
 - B. Missing or loose balance weights.

TRANSMISSION FLUID LEVEL INFORMATION

Checking fluid level, color and condition at regular intervals will provide early diagnosis information about the transmission. This information may be used to correct conditions that could cause major transmission repairs if not detected early. When adding or changing fluid, use only DEXTRON® III. Refer to SECTION 0B for maintenance information and servicing intervals.

NOTICE: Do not overfill. Overfilling will cause foaming, loss of fluid and possible damage to transmission.

Fluid level can be checked when transmission reaches normal operating temperatures of 82° to 93° C (180° to 200° F). This temperature is reached after approximately 24 km (15 miles) of highway driving.

- Fluid level can also be checked when transmission is cold (before driving vehicle). Fluid level should be within cold range.
- New fluid is red in color.

Important

When the fluid is new, it is red in color. The red dye is added so the assembly plant can identify it as transmission fluid and distinguish it from engine oil or coolant. The red dye is not a quality indicator, and is not permanent. As the vehicle is driven, the fluid will turn darker in color. The color may eventually turn light brown. Inaccurate fluid level readings will result if the fluid is checked immediately after the vehicle has been operating under certain conditions.

- In high ambient temperatures above 32° C (90° F).
- At sustained high speeds.
- In heavy city traffic during hot weather.
- As a towing vehicle.
- In commercial service.

TRANSMISSION FLUID CHECKING PROCEDURE

Figure 3

The fluid level should be checked with the engine at normal operating temperature, 82° to 93° C (180° to 200° F). Temperature will greatly affect fluid level. If the vehicle is not at normal operating temperature or the proper checking procedures are not followed, the fluid level indicator reading could be false, causing an improper fluid level adjustment. Improper fluid level may cause poor transmission performance and damage. Wait at least 30 minutes before checking fluid level if vehicle has been driven:

- When outside temperatures are above 32° C (90° F).
- In heavy traffic, especially in hot weather.
- While pulling a trailer.

A cold check of the fluid level can be made if the vehicle has not been operated for at least eight hours. The cold check should be used as a reference only. A hot check must be performed if fluid is added during a cold check.

1. Start engine.
 - Hot check - operate vehicle for minimum of 24 km (15 miles) or until normal operating temperature has been reached.
 - Cold check - let engine run for 5 minutes if outside temperature is 10° C (50° F) or above. If outside temperature is below 10° C (50° F), the engine may have to run longer. The cold check should only be used as a preliminary check, followed by a "Hot Check."
2. Park vehicle on level ground.
3. Move transmission control lever to "PARK."
4. Apply parking brake and block tires and wheels.
5. Press brake pedal.
6. Move transmission control lever through each gear range.
 - A. Pause approximately 3 seconds in each range.
 - B. Return transmission control lever to "PARK" position.
7. Let engine idle for 3 minutes with accessories off.

HYDRA - MATIC 4L60 - E

CHECK IN PARK, ENGINE IDLING, VEHICLE LEVEL.
TRANS HOT MUST BE IN CROSSHATCH.
DO NOT OVERFILL.
DEXTRON® - III FLUID ONLY

10-3-84
DS0057A

Figure 3 - Checking Automatic Transmission Fluid Level

NOTICE: Do not overfill. Overfilling will cause foaming, loss of fluid and possible damage to the transmission.

8. Check fluid level, color and condition.
 - A. Check both sides of fluid level indicator.
 - Use lowest level.
 - B. If fluid level is low add only to "COLD" area for cold check or "HOT" area for hot check.

! Important

- Do not overfill.
- C. Recheck level after adding fluid.

GENERAL SERVICE PROCEDURES

NO AIR TOOL RECOMMENDATION

NOTICE: It is not recommended to use air powered tools to disassemble or assemble transmissions. Improper bolt torques can contribute to transmission repair conditions, and this information vital to diagnosis can only be detected when using hand tools.

PARTS CLEANING, INSPECTION AND REPLACEMENT

Use appropriate safety equipment such as:

- Safety glasses, safety shoes, gloves.
- Keep work areas and tools clean.
- Clean transmission exterior before removing parts.
- Do not use wipe cloths or rags.
- Do not use solvents on:
 - Rubber seals.
 - Plastic/Teflon® thrust washers or spacers.
- Blow out all passages with compressed air.
- Clean out small passages with fine wire.
- Handle parts carefully to prevent damage.

NOTICE: The assembly of some components will require use of an assembly lube. It is recommended that J 36850 Transjel™ or equivalent, be used during assembly. Do not use any type of grease to retain parts during assembly of this unit. Lubricants other than the recommended assembly lube will change fluid characteristics and cause undesirable shift conditions and/or oil filter clogging.

- When installing screws, bolts or studs into aluminum, always dip the threads in Transjel™ or equivalent.
- Recondition damaged or stripped aluminum threads with thread inserts.
- Replace all gaskets and O-ring seals.
 - Do not use gasket cement or sealers.
- Replace Teflon® and rubber lip seals only when necessary and install using the appropriate seal installer and sizer.

Inspect

- Manual linkage for:
 - A. Wear at pivoting points.
 - B. Bent or broken links and rods.
- All seals, gaskets, O-ring seals and mating surfaces for:
 - A. Nicks.
 - B. Cuts.
 - C. Damage.
- Snap rings for:
 - A. Expansion or compression.
 - B. Distortion.
 - C. Nicks.
 - D. Proper ring-to-groove fit.
- Bearings and thrust surfaces for:
 - A. Wear.
 - B. Scoring.
 - C. Pitting.

FLYWHEEL/TORQUE CONVERTER CLUTCH VIBRATION TEST PROCEDURE

NOTICE: Make sure to use the correct bolts/screws to secure the flywheel to the converter. If the bolts/screws are too long, they could bottom out in the lug nuts on the converter and dent the housing, causing internal damage to the converter.

Remove or Disconnect

1. Start engine.
2. With engine at idle speed and transmission in "PARK" or "NEUTRAL," observe vibration.
3. Shut off engine.
4. Raise and suitably support vehicle. Refer to SECTION 0A.
5. Transmission converter cover bolts/screws.
6. Flywheel bolts/screws.
 - Discard flywheel bolts/screws.
7. Rotate torque converter clutch 120 degrees (1/3 turn).

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Flywheel bolts/screws.
 - Hand start flywheel bolts/screws.
 - Use new flywheel bolts/screws with retaining compound removed from first three threads of flywheel bolts/screws.

Tighten

- Flywheel bolts/screws to 63 N.m (46 lb. ft.).
2. Transmission converter cover bolts/screws.

Tighten

- Transmission converter cover bolts/screws to 10 N.m (89 lb. in.).
3. Lower vehicle.
 4. Start engine and check for vibration.
 - If vibration still exists repeat this procedure until best possible balance is obtained.

FLUID LEAK DIAGNOSIS

Figure 4

The cause of most external leaks generally can be located and repaired with the transmission in the vehicle.

- A BOTTOM PAN GASKET
- B CASE
- C COOLER CONNECTORS
- D SERVO COVER SEAL
- E OIL FILL TUBE SEAL
- F OIL PUMP SEAL
- G OIL PUMP TO CASE SEAL

- J ELECTRICAL CONNECTOR SEAL
- K MANUAL SHAFT SEAL
- L EXTENSION TO CASE SEAL
- M EXTENSION OIL SEAL
- N LINE PRESSURE PLUG

05-12-95
BT0027A

Figure 4 - Automatic Transmission Fluid Leak Points

7A-8 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

Methods for Locating Leak

GENERAL METHOD

1. Verify leak is transmission fluid.
2. Thoroughly clean suspected leak area.
3. Operate vehicle for about 24 km (15 miles) or until normal operating temperatures are reached.
4. Park vehicle over clean paper or cardboard.
5. Shut off engine and look for fluid spots on paper.
6. Make necessary repairs.

POWDER METHOD

1. Thoroughly clean suspected leak area with solvent.
2. Apply aerosol type powder (foot powder) to suspected leak area.
3. Operate vehicle for about 24 km (15 miles) or until normal operating temperatures are reached.
4. Shut off engine.
5. Inspect suspected leak area and trace leak path through powder to find source.
6. Make necessary repairs.

DYE AND BLACK LIGHT METHOD

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow manufacturer's recommendations for amount of dye to use.
2. Detect leak with black light.
3. Make necessary repairs.

Repairing the Leak

Once the leak has been pinpointed and traced back to its source, the cause of the leak must be determined for it to be properly repaired. For example, if a gasket is replaced, but the sealing flange is bent, the new gasket will not repair the leak. The bent flange must also be repaired.

The following conditions may cause a leak. Before attempting to repair a leak, these conditions should be checked and corrected if necessary.

GASKETS

Inspect

- Fluid level/pressure too high.
- Plugged or kinked vent hose.
- Improperly torqued fasteners, dirty or damaged threads.
- Warped flanges or sealing surface.
- Scratches, burrs or other damage to sealing surface.
- Damaged, worn, or improper gasket.
- Cracking or porosity of component.
- Improper sealant used, where applicable.
- Incorrect gasket.

SEALS

Inspect

- Fluid level/pressure too high.
- Plugged or kinked vent hose.
- Damaged seal bore.
- Damaged or worn seal.
- Improper installation.
- Cracks in component.
- Scratched, nicked or damaged manual or output shaft surface.
- Loose or worn bearing causing excess seal wear.

Possible Points of Fluid Leaks

OIL PAN

Inspect

- Incorrectly tightened oil pan bolts/screws.
- Improperly installed or damaged oil pan gasket.
- Damaged oil pan.
- Incorrect oil pan gasket.

CASE OR CASE EXTENSION OIL LEAK

Inspect

- Damaged or missing transmission filler tube seal.
- Mislocated filler tube bracket.
- Damaged vehicle speed sensor seal.
- Damaged manual shaft seal.
- Loose or damaged oil cooler connector fittings.
- Worn or damaged propeller shaft oil seal.
- Loose parking pawl shaft cup plug, if equipped.
- Loose line pressure pipe plug.
- Porous casting.

LEAK AT TORQUE CONVERTER END

Inspect

- Torque converter seal for damage.
 - Torque converter seal lip cut. Check torque converter hub for damage.
 - Bushing moved forward and damaged.
 - Garter spring missing from seal.
- Torque converter clutch leak in weld area.
- Porous casting of transmission case or oil pump.

LEAK AT VENT PIPE OR FLUID FILLER TUBE

Inspect

- Over-filled system.
- Fluid level indicator not locked down.
- Water or coolant in fluid. Fluid will appear milky.
- Transmission case porous.
- Incorrect fluid level indicator.
- Plugged vent.
- Plugged drain-back holes.
- Mispositioned oil pump-to-case gasket.

Transmission Case Porosity Repair

1. Clean leak area with solvent and air dry.

CAUTION: Epoxy cement may cause skin irritations and eye damage. Read and follow all information on container label as provided by manufacturer.

2. Mix sufficient amount of epoxy cement, GM P/N 1052533, or equivalent, following manufacturer's recommendations.
3. Use a heat gun to warm transmission case surface, apply epoxy cement with clean, dry soldering acid brush.
4. Allow epoxy cement to cure for three hours before starting engine.
5. Repeat fluid leak diagnosis procedures to determine if leak is fixed.

TORQUE CONVERTER CLUTCH ELECTRICAL CONTROLS

The Torque Converter Clutch (TCC) system uses controls that are both internal and external to the transmission assembly. For information on internal control components of the TCC system, refer to SECTION 7A-14A.

The external control components of the TCC system include:

Cruise Control Release Switch - To avoid stalling the engine when braking, the TCC is released any time the brake pedal is applied.

Powertrain Control Module (PCM) - Receives input signals and grounds TCC solenoid to apply clutch when proper operating conditions are met.

Throttle Position Sensor - Sends throttle position information to PCM.

Mass Air Flow (MAF) Sensor - Sends inlet air speed information to the PCM for fuel calibration and engine load.

Manifold Absolute Pressure (MAP) Sensor - Sends engine vacuum (load) information to PCM. Back-up system to MAF.

Vehicle Speed Sensor - Sends vehicle speed information to PCM.

Engine Coolant Temperature Sensor - Sends engine coolant temperature information to PCM.

TORQUE CONVERTER CLUTCH DIAGNOSIS

To properly diagnose the torque converter clutch (TCC) system, perform all electrical testing first and then hydraulic testing. Refer to SECTION 6E3 and SECTION 7A-14A for additional TCC information.

ON-VEHICLE SERVICE

STEERING COLUMN SHIFT CONTROL

Linkage Adjustment

Figure 5

Linkage should be adjusted so the engine will start in only "PARK" and "NEUTRAL."

CAUTION: Personal injury may result if the engine can be started in a drive position.

NOTICE: Steering column attachment to body must be complete and all body bolts/screws must be secure before adjusting steering column shift control linkage. Improper linkage adjustment can lead to clutch or band failure.

Adjust

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Position transmission control lever in neutral gate notch.
 - Place a 2-3 lb. weight on the end of the control lever to eliminate any play.
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Loosen swivel bolt/screw (816) enough to allow rod (820) to slide freely in swivel (818).
4. Set transmission range selector lever (807) in neutral detent.
5. Hold swivel (818) flush against equalizer lever (819) and finger tighten swivel bolt/screw (816) against rod (820).
 - No force should be exerted in either direction on rod (820) or equalizer lever (819) while tightening swivel bolt/screw (816).

Tighten

- Swivel bolt/screw (816) to 28 N.m (21 lb. ft.).
6. Lower vehicle.

Shift Control Linkage

Figure 5

Remove or Disconnect

1. Place transmission control lever in neutral gate notch.
2. Retainer (804), washer (803), bearing (802) and insulator (801).
3. Rod (820) from steering column (805).
4. Raise and suitably support vehicle. Refer to SECTION 0A.
5. Rod (820) from equalizer lever (819).
 - Remove swivel bolt/screw (816), washer (817) and swivel (818).
6. Equalizer lever (819).
 - A. Remove retainer (808) and disconnect from lever (807).
 - B. Insulator (814), washer (810), spring (815).
7. Bracket bolts/screws (811).
8. Bracket (812).
9. Nut (809).
10. Selector lever (807).

Figure 5 - Steering Column Shift Control Linkage

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Selector lever (807) to stud.
2. Nut (809).

Tighten

- Nut (809) to 27 N·m (20 lb. ft.).
3. Bracket (812) to frame (813).
4. Bracket bolts/screws (811).

Tighten

- Bracket bolts/screws (811) to 21 N·m (16 lb. ft.).

5. Spring (815), washer (810) and insulator (814) to equalizer lever (819).
 - Install equalizer lever (819) to bracket (812).
6. Equalizer lever (819) to selector lever (807) and secure with retainer (808).
 - Make sure transmission is in neutral.
7. Swivel (818), washer (817) and swivel bolt/screw (816) to rod (820).
 - Do not tighten at this time.
8. Rod (820) through bracket on steering column (805).
 - Attach insulator (801), bearing (802), washer (803) and retainer (804) to rod (820).
9. Lower vehicle.
10. Adjust floor shift control linkage if necessary. Refer to "Steering Column Shift Control Linkage Adjustment" in this section.

Backup Lamp and Transmission Position Sensor Switch

Figure 6

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Instrument panel sound insulator, if Buick. Refer to SECTION 8C.
3. Electrical connectors from switch (821).
4. Place shift lever in neutral.
5. Switch (821) from steering column.
 - Use screwdriver to carefully pry switch tangs from rectangular holes in steering column jacket (824).

Install or Connect

1. Switch (821) to steering column.
 - A. Make sure shift lever is in neutral.
 - B. Position actuator on switch about midway through it's travel so actuator will align with hole in shift tube.
 - C. Position connector (outboard) side of switch (821) to fit into cutout on steering column jacket (824).
 - D. Push down on switch (821) to fully seat.

Figure 6 - Backup Lamp and Transmission Position Sensor Switch

2. Electrical connectors to switch.
3. Instrument panel sound insulator, if Buick. Refer to SECTION 8C.
4. Adjust switch (821) by placing shift lever in low gear then back to park.
5. Battery negative cable.

FLOOR SHIFT CONTROL

REMOVAL AND INSTALLATION

Figures 7 and 8

Linkage should be adjusted so the engine will start in only "PARK" and "NEUTRAL."

CAUTION: Personal injury may result if the engine can be started in a drive position.

NOTICE: Refer to "Notice" on page 7A-1 of this section.

Remove or Disconnect

1. Retainer (882) and shifter handle (881).
2. Floor shift control console, for removal procedures, refer to SECTION 8C.
3. Transmission shift (872) cable and park-lock cable (868).
4. Floor shift control assembly bolts/screws (889).
5. Floor shift control assembly (890).

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Floor shift control assembly (890).
2. Floor shift control bolts/screws (889).

Tighten

- Tighten bolts/screws (889) to 5 N.m (44 lb. in.).
3. Transmission shift (872) cable and park-lock cable (868).
 4. Console (887). For installation procedures, refer to SECTION 8C.
 5. Shifter handle (881) and retainer (882).

Brake Transmission Shift Interlock Solenoid

REMOVAL AND INSTALLATION

Figure 7

Remove or Disconnect

1. Shifter handle (881) and retainer (882).

7A-12 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

Figure 7 - Floor Shift Control Removal and Installation

2. Floor console trim plate (884). Refer to SECTION 8C.
3. BTSI solenoid electrical connector.
4. BTSI solenoid (869) and attaching clips.

Install or Connect

1. BTSI solenoid (869) and attaching clips.
2. BTSI solenoid electrical connector.
3. Floor console trim plate (884). Refer to SECTION 8C.
4. Shifter handle (881) and retainer (882).

Important

- For Brake Transmission Shift Interlock Solenoid (BTSI) removal and installation procedures with column shift, refer to SECTION 3F5A.

Backup Lamp and Transmission Position Sensor Switch

REMOVAL AND INSTALLATION

Figure 7

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Shifter handle (881) and retainer (882).
3. Floor console (887). For removal procedures, refer to SECTION 8C.
4. Backup Lamp/Transmission Position Sensor Switch electrical connector.
5. Switch bolts/screws.
6. Backup Lamp/Transmission Position Sensor Switch.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Backup Lamp/Transmission Position Sensor Switch.
2. Backup Lamp/Transmission Position Sensor Switch bolts/screws.
3. Backup Lamp/Transmission Position Sensor Switch electrical connector.
4. Floor console (887). For installation procedures, refer to SECTION 8C.
5. Shifter handle (881) and retainer (882).
6. Battery negative cable.

Figure 8 - Transmission Shift Control Cable

7A-14 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

Shift Control Cable

REMOVAL AND INSTALLATION

Figures 7 and 8

Remove or Disconnect

1. Raise and suitably support vehicle.
2. Shift control cable (872) from transmission lever (870).
3. Shift control cable bracket (871) and bolts/screws (858) from transmission (853).
4. Shift control cable (872) from bracket (871).
5. Lower vehicle.
6. Shifter handle (881) and retainer (882).
7. Floor console (887). For removal procedures, refer to SECTION 8C.
8. Shift control cable (872) from floor shift control assembly (890).
9. Shift control cable (872)

Install or Connect

1. Shift control cable (872) to floor shift control assembly (853).
2. Floor console (887). For installation procedures, refer to SECTION 8C.
3. Shifter handle (881) and clip (882).
4. Raise vehicle.
5. Shift control cable (872) to bracket (871).
6. Shift control cable bracket (871) and bolts/screws (858) to transmission (853).

Tighten

- Bolts/screws (858) to 24 N.m (18 lb. ft.).

Adjust

- Trans shift cable (872) (If necessary).
7. Trans shift cable (872) to transmission selector lever (870).
 8. Lower vehicle.

Park Lock Cable

REMOVAL AND INSTALLATION

Figure 7

Remove or Disconnect

1. Disable S.I.R. system. Refer to SECTION 9J.
2. Shifter handle (881) and retainer (882).
3. Floor console (887). For removal procedures, refer to SECTION 8C.
4. Lower I/P trim plate and knee bolster. Refer to SECTION 8C.
5. Park lock cable (868) from floor shift control assembly (890).
6. Park lock cable (868) from accelerator bracket.
7. Stop lamp switch.

8. Knee bolster deflector. Refer to SECTION 8C.
9. Lower Steering Column. Refer to SECTION 3F.
10. Park lock cable from ignition switch.
11. Park lock cable (868).

Install or Connect

1. Park lock cable (868).
2. Park lock cable (868) to ignition switch.
3. Raise and connect steering column. Refer to SECTION 3F.
4. Knee bolster deflector. Refer to SECTION 8C.
5. Stop lamp switch.
6. Park lock cable (868) to accelerator pedal bracket.
7. Park lock cable (868) to floor shift control assembly (890).
8. Knee bolster and lower I/P trim plate. Refer to SECTION 8C.
9. Front floor shift console (887). For installation procedures, refer to SECTION 8C.
10. Shifter handle (881) and retainer (882).
11. Enable S.I.R. Refer to SECTION 9J.

CHANGING FLUID AND OIL FILTER

Figures 9 and 10

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.

Figure 9 - Transmission Oil Pan and Transmission Oil Filter

- Place drain pan under oil pan (75).

NOTICE: When removing oil pan bolts/screws use caution in order not to damage the oil pan sealing surfaces.

- Oil pan bolts/screws (76) from front and sides only.
- Loosen rear oil pan bolts/screws (76) approximately four turns.
- Lightly tap oil pan (75) with rubber mallet or pry to drain fluid.
- Drain fluid.

Inspect

- Fluid color and condition. Refer to chart in Parts Cleaning, Inspection and Replacement of this section.
- Remaining oil pan bolts/screws (76), oil pan (75) and gasket (73).
 - Filter (72) and seal (71).
 - Pry out seal (71) using a flat bladed tool.

Inspect

- Filter (72). Open filter by prying the metal crimping away from the top of the filter (black) and pull apart. The filter may contain evidence for root cause diagnosis:
 - Clutch material.
 - Bronze slivers indicating bushing wear.
 - Steel particles.

Clean

- Transmission case and gasket surfaces with solvent and air dry.
 - All traces of gasket material must be removed.

Install or Connect

NOTICE: Refer to “Notice” on page 7A-1 of this section.

Figure 10 - Automatic Transmission Oil Pan Bolt/Screw and Conical Washer

- Coat new seal (71) with small amount of Transjel™ or equivalent.
- New seal (71) to transmission.
 - Tap into place using a suitable size socket.
- Filter (72) into transmission case.

Inspect

- Oil pan bolts/screws (76) whenever removed from pan (75).

NOTICE: Automatic transmission oil pan bolts/screws and washers must not be reused if the conical washer is reversed. Failure to replace the oil pan bolts/screws and washers may result in improper fastening of system components.

- New gasket (73) and old oil pan (75).
- Oil pan bolts/screws (76).

Tighten

- Oil pan bolts/screws (76) to 16 N.m (12 lb. ft.).
- Lower vehicle.

NOTICE: Do not overfill. Overfilling will cause foaming, loss of fluid and possible damage to transmission.

- Fill transmission with DEXRON® III to the “COLD” fluid level reading.
- Perform transmission fluid level checking procedure. Refer to “Transmission Fluid Level Checking Procedure” in this section.
 - Do not overfill.

TRANSMISSION OIL COOLER FLUSHING PROCEDURE

Figure 11

Tools Required:

- J 35944 “Transmission” Oil Cooler and Line Flusher
- J 35944-20 Cooler Flushing Fluid

NOTICE: The automatic transmission oil cooler flushing procedure must be performed whenever a transmission is removed for service to remove existing fluid which may be contaminated and to prevent contamination of new fluid. The flushing procedure must be performed after the removal of the old transmission and before the installation of the overhauled or replacement transmission.

7A-16 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

NOTICE: Flushing tool is designed for use with only J 35944-20 flushing fluid. Use of any other fluid can result in damage to the tool, automatic transmission oil cooler components, or improper flushing of the cooler. After overhauled or service replacement transmission is reinstalled in vehicle, do not reconnect oil cooler pipes.

1. Remove fill cap on J 35944 and fill with 0.6 liters (20-21 ounces) of J 35944-20.
 - A. Do not overfill tool.
 - B. Follow manufacturer's suggested procedures for handling fluid.
2. Replace cap on J 35944 and pressurize to 550-700 kPa (80-100 psi).

NOTICE: Shop air supply must be equipped with a water/oil filter, and pressure should not exceed 825 kPa (120 psi). Failure to use a water/oil filter can allow residual moisture to cause corrosion of components. Excessive air pressure can cause damage to components.

3. Install J 35944 to vehicle undercarriage with hook provided, and attach hose from flushing tool with top fitting at transmission end of the oil cooler pipe (835).
4. Install discharge hose to bottom fitting at transmission end of oil cooler pipe (836). Clip opposite end of discharge hose to oil drain container.

5. With water valve on J 35944 in "OFF" position attach the water supply to tool.
6. Turn on water supply at faucet.
7. Flush fluid by opening water valve on tool to "ON" position for about 10 seconds.
 - If water does not flow through cooler (system is completely plugged), do not complete flushing procedure. Turn water off immediately and inspect cooler and upper and lower pipes for restriction. Replace cooler and/or cooler pipes as required.
8. Turn water valve on tool to "OFF" position and clip discharge hose to 5-gallon pail. Cover pail with shop cloth to prevent splash.
9. Turn water valve on tool to "ON" position and depress trigger to mix flushing fluid into water flow.
 - Use bale clip to hold trigger down.
10. Flush cooler with water and fluid for two minutes.
 - Every 15-20 seconds during flushing procedure, attach air supply to air valve on J 35944 and leave in place for 3-5 seconds to create surging action for complete cleaning.
11. Release trigger and turn water valve on tool to "OFF" position.
12. Disconnect both hoses from upper and lower pipes (835 and 836).
13. Connect hose from flushing tool to **Bottom** fitting at transmission end of oil cooler pipe (836).

Figure 11 - Transmission Oil Cooler Pipes and TCC Temperature Switch

14. Connect discharge hose to **Top** fitting at transmission end of oil cooler pipe (835).
 - Reversing hoses will create backflush.
15. Repeat steps 9 and 10.
16. Release trigger and allow water only to rinse cooler for one minute.
17. Turn water valve on tool to "OFF" position and turn water supply off at faucet.
18. Attach air supply to air valve on J 35944 and dry system out with dry compressed air for at least two minutes. Be sure no moisture can be seen leaving hose.
 - Use air chuck clip, if available, to secure air chuck onto air valve for ease of operation.
19. Remove J 35944 and discharge hose from upper and lower pipes (835 and 836).

3. Electrical connector from switch (9).
4. Switch (9) from block fitting (11).

⇔ Install or Connect

1. If reusing switch (9), coat threads with sealer.
2. Switch (9) to block fitting (11).

⌚ Tighten

- Switch (9) to 27 N.m (20 lb. ft.) while using a backup wrench.
3. Electrical connector to switch (9).
 4. Right side three way warm up catalytic converter and heat shield. Refer to SECTION 6F.
 5. Lower vehicle.
 6. Start engine, check fluid level and fitting for leak.

SERVICEABLE COMPONENTS

**TORQUE CONVERTER CLUTCH
TEMPERATURE SWITCH**

Figure 11

⇔ Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Right side three way warm up catalytic converter and heat shield. Refer to SECTION 6F.

TRANSMISSION OIL COOLER

Figure 12

⇔ Remove or Disconnect

1. Place a drain pan under oil cooler (101).
2. Oil cooler pipe fittings from oil cooler (101).
 - Use a backup wrench.
3. Bolts/screws (102) from oil cooler (101).
4. Oil cooler (101).
5. Nuts (103), if necessary.

Figure 12 - Transmission Oil Cooler

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 in this section.

1. Nuts (103), if removed.
2. Oil cooler (101).
3. Bolts/screws (102) to oil cooler (101).

Tighten

- Bolts/screws to 10 N.m (89 lb. ft.).
4. Oil cooler pipe fittings to oil cooler (101).

Tighten

- Oil cooler pipe fittings to 17 N.m (13 lb. ft.) while using a backup wrench.
5. Drain pan from under oil cooler (101).

Adjust

- Fluid level. Refer to "Fluid Level Checking procedure" in this section.

FLUID FILLER TUBE AND SEAL

Figure 13

Remove or Disconnect

1. Indicator (851).
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Bolt/screw (849) retaining filler tube (850) to cylinder head.
4. Loosen filler tube (850) from transmission.
5. Place drain pan under transmission.
6. Filler tube (850) from transmission.
7. Transmission filler tube seal (852) from transmission.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

Figure 13 - Transmission Fluid Filler Tube and Transmission Fluid Level Indicator

1. Transmission filler tube seal (852) into transmission case hole.
2. Filler tube (850) to transmission.
3. Bolt/screw (849) to cylinder head.

Tighten

- Bolt/screw (849) to 47 N.m (35 lb. ft.).
4. Lower vehicle.
 5. Indicator (851).

Adjust

- Transmission fluid level. Refer to "Transmission Fluid Checking Procedure" in this section.

VENTILATION HOSE

Figure 14

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Right side three way warm up catalytic converter and heat shield. Refer to SECTION 6F.
3. Ventilation hose (19) from transmission ventilation tube (17) at transmission (853).
4. Ventilation hose clips (20) from transmission support (859).
 - Squeeze clip tabs to remove from holes in transmission support (859).

Install or Connect

1. New ventilation hose clips (20) around ventilation hose (19) at white paint stripes, if required.
2. Ventilation hose clips (20) into holes on rear side of transmission support (859).
3. Ventilation hose (19) to transmission ventilation tube (17) at transmission (853).
4. Right side three way catalytic converter and heat shield. Refer to SECTION 6F.
5. Lower vehicle.

VEHICLE SPEED SENSOR

Figure 15

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Electrical connector from sensor (99).
3. Bolt/screw (100).
4. Sensor (99) and O-ring seal (42).

Inspect

- Seal (42) and transmission case (10). Replace seal (42), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

Figure 14 - Transmission Ventilation Hose

Figure 15 - Vehicle Speed Sensor

1. Sensor (99) and O-ring seal (42) to transmission.
2. Electrical connector to sensor (99).
3. Bolt/screw (100).

Tighten

- Bolt/screw (100) to 11 N•m (97 lb. in.).
4. Lower vehicle.

CASE EXTENSION

Figures 16 and 28

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Vehicle speed sensor electrical connector.
3. Vehicle speed sensor (99), seal (42), and bolt/screw (100) from case extension (31).
4. Propeller shaft. Refer to SECTION 4A.
5. Transmission mount nut (840) and washer (864).
6. Transmission mount bolts/screws (892).
 - Support and raise transmission slightly, using transmission jack.
7. Transmission mount (890) and shims (893) if present.
8. Case extension bolts/screws (32).
9. Case extension (31) with seal (30).

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Case Extension (31) with new seal (30).

Figure 16 - Case Extension

2. Bolts/screws (32)

Tighten

- Bolts/screws (32) to 35 N•m (26 lb. ft.).
3. Transmission mount (890) and shims (893) if present.
 4. Transmission mount bolts/screws (892).

Tighten

- Bolts/screws to 34 N•m (25 lb. ft.).
5. Lower transmission.
 6. Transmission mount nut (840) and washer (864).

Tighten

- Nut to 41 N•m (30 lb. ft.).
7. Propeller shaft. Refer to SECTION 4A.
 8. Vehicle speed sensor (99), seal (42) to case extension (31).
 9. Vehicle speed sensor, bolt/screw (100).

Tighten

- Bolt/screw (100) to 11 N•m (97 lb. in.).
10. Vehicle speed sensor electric connector.
 11. Lower vehicle.

2-4 BAND SERVO

Figures 17, 18, and 28

Tool Required:
J 29714-A Servo Cover Depressor

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Right side warm-up three way catalytic converter and catalytic converter heat shield. Refer to SECTION 6F.
3. Transmission mount nut (840).
4. Transmission support bolts/screws (841).
 - Support and raise transmission slightly, using transmission jack.
5. Transmission support (859).

Figure 17 - 2-4 Band Servo Cover

Figure 18 - 2-4 Band Servo

6. Lower transmission (853) to access servo cover (15).
7. Remove transmission oil pan bolt/screw to access transmission oil pan rail.
8. Install J 29714-A to transmission oil pan rail.
9. Depress servo cover (15).
10. Ring (13), using suitable tool.
11. J 29714-A from transmission support rail.
12. Servo cover (15).
 - A. If unable to remove by hand, use slip joint pliers.
 - B. O-ring seal may remain in transmission case.
13. Servo (16).

Inspect

- Servo. Refer to SECTION 7A-14B for inspection, disassembly and servo pin measurement procedures.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Servo (16).
2. Servo cover (15).
 - Replace O-ring seal on servo cover (15), if removed.
3. J 29714-A to transmission oil pan rail.
4. Depress servo cover (15).
5. Ring (13).
6. Remove J 29714-A.
7. Replace transmission oil pan bolt/screw.

Tighten

- Transmission oil pan bolt/screw to 16 N.m (12 lb. ft.).
8. Raise transmission into position.
 9. Transmission support (859).
 10. Transmission support bolts/screws (841).

Tighten

- Transmission support bolts/screws (841) to 34 N.m (25 lb. ft.).
11. Transmission mount nut (840) and washer (864).

Tighten

- Transmission mount nut to 41 N.m (30 lb. ft.).
12. Warm up three way catalytic converter and catalytic converter heat shield. Refer to SECTION 6F.
 13. Lower vehicle.

Adjust

- Transmission fluid level. Refer to "Transmission Fluid Checking Procedure" in this section.

ACCUMULATORS

Figure 19

Remove or Disconnect

1. Oil pan and filter. Refer to "Changing Fluid and Oil Filter" in this section.
2. Bolts/screws (57 and 58) attaching cover and pin (62) to transmission case.
3. Cover and pin (62).
4. Piston (61), ring (60), and springs (59 and 59A).
 - Piston (61) and ring (60) may remain inside cover and pin (62).
5. Control valve, if replacing 3-4 accumulator. Refer to "Control Valve Body and Pressure Switch" in this section.
6. Spring (54), piston (52), ring (53) and pin (77).

Inspect

- Accumulators. Refer to SECTION 7A-14B for disassembly and inspection procedures.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Spring (54), piston (52), ring (53) and pin (77).
2. Control valve, if removed. Refer to "Control Valve Body and Pressure Switch" in this section.
3. Springs (59 and 59A), ring (60), and piston (61).
4. Cover and pin (62).
5. Bolts/screws (57 and 58) attaching cover and pin (62) to transmission case.

Tighten

- Bolts/screws (57 and 58) to 11 N.m (97 lb. in.).
6. Oil pan and filter. Refer to "Changing Fluid and Oil Filter" in this section.

OIL COOLER UPPER AND LOWER PIPES

Figures 11 and 12

NOTICE: Allow sufficient clearance to transmission oil cooler upper and lower pipes to prevent damage or wear which may cause transmission fluid loss.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Right side warm up three way catalytic converter. Refer to SECTION 6F.
3. Lower pipe (836) at radiator.
4. Upper and lower pipes (835 and 836) at transmission.

5. Oil cooler pipe retainer bolt/screw (833).
6. Oil cooler pipe retainer (837) from upper and lower pipes (835 and 836).
7. Upper pipe (835) from oil cooler pipe.
8. Upper and lower pipes (835 and 836) from vehicle.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Upper and lower pipes (835 and 836) into vehicle.
2. Upper pipe (835) to oil cooler pipe.
3. Oil cooler pipe retainer (837) to upper and lower pipes (835 and 836).
4. Oil cooler and pipe retainer bolt/screw (833).

Tighten

- Oil cooler pipe retainer bolt/screw (833) to 1.9 N.m (17 lb. in.).
5. Upper and lower cooler pipe fittings.

Tighten

- Upper and lower cooler pipe fittings to 21 N.m (15 lb. ft.).
6. Lower pipe (836) to radiator fitting.
- ### Tighten
- Fitting to 23 N.m (17 lb. ft.).
7. Right side warm up three way catalytic converter. Refer to SECTION 6F.
 8. Lower vehicle.

TRANSMISSION CONVERTER COVER

For service information on the transmission converter cover, refer to "Transmission Removal and Installation" in this section.

OIL PAN AND GASKET

For service information on the transmission oil pan and gasket, refer to "Changing Fluid and Oil Filter" in this section.

OIL FILTER AND SEAL

For service information on the transmission oil filter and seal, refer to "Changing Fluid and Oil Filter" in this section.

PRESSURE REGULATOR VALVE

Figure 20

Remove or Disconnect

1. Oil pan. Refer to "Changing Fluid and Oil Filter" in this section.
2. Compress with small screwdriver: regulator valve (218) and spring (219), spring (220), boost valve (221), and sleeve (222).

10-3-95
DS0127A

Figure 19 - Wiring Harness, Pressure Switch, Control Valve and Accumulators

- 217 COVER, AUTOMATIC TRANSMISSION OIL PUMP
- 218 VALVE, PRESSURE REGULATOR
- 219 SPRING, PRESSURE REGULATOR VALVE
- 220 SPRING, PRESSURE REGULATOR ISOLATOR
- 221 VALVE, REVERSE BOOST
- 222 SLEEVE, REVERSE BOOST VALVE
- 223 RING, OIL PUMP REVERSE BOOST VALVE RETAINING

10-3-94
DS0137A

Figure 20 - Pressure Regulator

3. Ring (223).
4. Slowly release tension.
5. Sleeve (222), boost valve (221), spring (220), spring (219) and regulator valve (218) from transmission oil pump cover bore.

Inspect

- Pressure regulator valve. Refer to SECTION 7A-14B for inspection and disassembly procedures.

Install or Connect

1. Regulator valve (218), spring (219), spring (220), boost valve (221) and sleeve (222) to transmission oil pump cover bore.
2. Compress springs (219 and 220) with a small screwdriver.
3. Ring (223).
4. Oil pan. Refer to "Changing Fluid and Oil Filter" in this section.

CONTROL VALVE AND PRESSURE SWITCH

Figures 19, 21 through 25

Remove or Disconnect

1. Oil pan and oil filter. Refer to "Changing Fluid and Oil Filter" in this section.
2. Electrical connectors from control valve body components.
3. TCC PWM solenoid retainer (379) and solenoid (396).
4. Torque converter clutch (TCC) solenoid bolts/screws (51) and TCC solenoid (50) with O-ring seal (49) and wiring harness (65). Lay wiring harness aside.
5. Pressure switch bolts/screws (70) and pressure switch (68).

6. Manual detent spring bolt/screw (64) and spring (63).
7. Remaining control valve body bolts/screws (69).
8. Manual valve link (705).
9. Control valve (67).
10. Check balls (2, 3, 4, 5, 6, 8 and 12) from control valve (67).

Clean

- Control valve components.

Inspect

- Control valve. Refer to SECTION 7A-14B for disassembly, cleaning, inspection and repair of control valve body.

Install or Connect

NOTICE: Install all bolts/screws of valve body, then torque in a spiral pattern starting from the center. If bolts/screws are torqued at random, valve bores may be distorted and inhibit valve operation. Refer to "Notice" on page 7A-1 of this section.

1. Check balls (2, 3, 4, 5, 6, 8 and 12) to control valve (67).
2. Control valve (67) and manual valve link (705) to transmission case.
 - Be careful not to damage solenoid filter screens when installing control valve (67).
3. Control valve body bolts/screws (69).
4. Manual detent spring (63) and bolt/screw (64).
 - Do not tighten bolt/screw (64) at this time.
5. Pressure switch (68) and bolts/screws (70).
6. TCC solenoid (50) with O-ring (49) and wiring harness (65) and bolts/screws (51).

Tighten

- Bolts/screws (51) to 11 N·m (97 lb. in.).

Figure 21 - Control Valve

7. TCC PWM solenoid (396) and retainer (379) to control valve (67).
8. Electrical connectors to control valve body components.

Tighten

- Control valve body bolts/screws (69) in a spiral pattern to 11 N•m (97 lb. in.).
- Pressure switch bolts/screws (70) to 11 N•m (97 lb. in.).
- Manual detent spring bolt/screw (64) to 24 N•m (18 lb. in.).

9. Oil filter and oil pan. Refer to "Changing Fluid and Oil Filter" in this section.

CONTROL AND SHIFT SOLENOIDS

Figures 19, 21, and 23

Remove or Disconnect

1. Oil pan and oil filter. Refer to "Changing Fluid and Oil Filter" in this section.

Figure 22 - Manual Valve Link

Figure 23 - Control Valve Body Bolt/Screw Locations

Figure 24 - Control Valve Body Check Ball Locations

Figure 25 - Transmission Case Check Balls

2. Accumulator cover bolts/screws (57 and 58).
3. 1-2 accumulator cover (62), piston (61) and springs (59 and 59A).
4. Component electrical connectors.
5. Pressure control solenoid retainer bolt/screw (378), retainer (373) and solenoid (377).
6. Shift solenoid retainers (379) and shift solenoids (367).
7. 3-2 control solenoid retainer (379) and control solenoid (394).

 Install or Connect

1. 3-2 control solenoid (394) and retainer (379).
2. Shift solenoids (367) and retainers (379).
3. Pressure control solenoid (377), retainer (373) and retainer bolt/screw (378).
 - Position pressure control solenoid (377) with the electrical tabs facing outboard.
4. Component electrical connectors.
5. 1-2 accumulator piston (61) to the accumulator cover (62).
 - Piston legs must face toward the case when installed.
6. 1-2 accumulator springs (59 and 59A) onto piston (61).
7. 1-2 accumulator cover (62) and bolts/screws (57 and 58).

 Tighten

- Bolts (57 and 58) to 11 N.m (97 lb. in.).
8. Oil pan and oil filter. Refer to "Changing Fluid and Oil Filter" in this section.

TCC PWM SOLENOID, TCC SOLENOID VALVE AND WIRING HARNESS

Figures 19, 21, and 23

Tool Required:
J 28458 Power Piston Seal Protector and
Diaphragm Retainer Installer

 Remove or Disconnect

1. Warm up, three way catalytic converter and heat shield. Refer to SECTION 6F.
2. Oil pan and oil filter. Refer to "Changing Fluid and Oil Filter" in this section.
3. External wiring harness connector from transmission pass-through connector.
 - Squeeze fore and aft flats on connector to release locking tabs and pull connector.
4. Accumulator cover bolts/screws (57 and 58).
5. 1-2 accumulator cover (62), piston (61) and springs (59 and 59A).
6. Component electrical connectors.
7. TCC PWM solenoid retainer (379).
8. TCC PWM solenoid (396) from control valve body.

9. Pressure control solenoid retainer bolt/screw (378) and retainer (373) and solenoid (377).
10. TCC solenoid valve bolts/screws (51).
11. Pass-through electrical connector from transmission case (10).
 - Use small end of J 28458 over top of connector and twist to release four tabs while at the same time pulling harness connector from the transmission case.
12. TCC solenoid valve with wiring harness (65) from transmission case (10).

 Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 in this section

1. TCC solenoid with wiring harness (65) to transmission case (10).
2. Pass-through electrical connector to transmission case (10).
3. TCC solenoid bolts/screws (51).
4. Pressure control solenoid (377) retainer (373) and bolt/screw (378).

 Tighten

- TCC solenoid bolts/screws (51) to 11 N.m (97 lb. in.).
 - Pressure control solenoid bolt/screw (378) to 11 N.m (97 lb. in.).
5. TCC PWM Solenoid (396) to control valve body.
 6. TCC PWM Solenoid retainer (379).
 7. Component electrical connectors.
 8. 1-2 accumulator piston (61) to the accumulator cover (62).

 Important

- Piston legs must face toward the case when installed.
9. 1-2 accumulator springs (59 and 59A) onto piston (61).
 10. 1-2 accumulator cover (62) and bolts/screws (57 and 58).

 Tighten

- Bolts/screws (57 and 58) to 11 N.m (97 lb. in.).
11. Wiring harness connector to transmission pass-through connector.
 12. Oil pan and oil filter. Refer to "Changing Fluid and Oil Filter" in this section.
 13. Warm-up, three way catalytic converter and catalytic converter heat shield. Refer to SECTION 6F.

TRANSMISSION REMOVAL AND INSTALLATION

Figures 9, 10 and 26 through 29

If transmission is being removed for repair, refer to section 7A-14A for diagnosis prior to removing transmission.

NOTICE: Automatic transmission oil cooler flushing must be performed when an automatic transmission is removed for service. The flushing procedure should be performed after the removal of the old transmission and before the installation of the overhauled or replacement transmission. Failure to flush the system may cause damage to the system and its components.

Tools Required:
J 21366 Converter Holding Strap

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Transmission fluid level indicator (851).
3. Raise and suitably support vehicle. Refer to SECTION 0A.
4. Propeller shaft. Refer to SECTION 4A.
5. Electrical connectors from transmission and vehicle speed sensor.
 - Position electrical harness away from transmission to prevent damage to harness or connectors.
6. Steering column shift control linkage from transmission. Refer to "Steering Column Shift Control Linkage" in this section.
7. Transmission converter cover bolts/screws (854) and cover (855) from transmission.
8. If transmission converter is being reused, mark position of flywheel-to-converter to maintain original balance during assembly.
9. Flywheel bolts/screws (857).
 - Discard flywheel bolts/screws (857).
10. Support transmission using transmission jack.
11. Loosen catalytic converter-to-intermediate pipe bolts/screws to allow for pivot.
12. Transmission mount nut (840) and washer (864).
13. Transmission support bolts/screws (841).
14. Transmission support (859) from vehicle.
15. Transmission mount bolts/screws (892), washers (891), mount (890) and shims (893).
16. Catalytic converter support bracket from transmission. Refer to SECTION 6F.
17. Lower transmission to access oil cooler upper and lower pipes.

Figure 26 - Transmission Converter Cover

Figure 27 - Torque Converter to Flywheel

18. Fill tube bolt/screw (849).
19. Place drain pan under transmission.
20. Fill tube (850) from transmission.
 - Plug transmission.
21. Oil cooler upper and lower pipes from transmission.
 - Plug all openings.
22. Support engine with suitable tool.
23. Transmission bolts/screws (866).
24. Attach J 21366 to transmission to retain transmission converter.

Figure 28 - Transmission Mount

7A-30 AUTOMATIC TRANSMISSION ON VEHICLE SERVICE

25. Lower transmission carefully to avoid damaging accelerator control cable, any pipes or shift control linkage.

Clean

- Transmission oil cooler. Refer "Transmission Oil Cooler Flushing Procedure" in this section.

Install or Connect

NOTICE: Refer to "Notice" on page 7A-1 of this section.

1. Raise transmission until alignment pins on engine align with alignment pin holes in transmission.
2. Remove J 21366.
3. Transmission bolts/screws (866).

Tighten

- Transmission bolts/screws (866) to 47 N.m (35 lb. ft.).
4. Remove engine support.
 5. Oil cooler upper and lower pipes to transmission.

Tighten

- Oil cooler upper and lower pipe fittings to 21 N.m (15 lb. ft.).
6. Fill tube (850) to transmission.

7. Fill tube bolt/screw (849).

Tighten

- Fill tube bolt/screw (849) to 47 N.m (35 lb. ft.).
8. Raise transmission to provide clearance for transmission support member (859).
 9. Transmission support member (859) into position.
 10. Transmission support bolts/screws (841).

Tighten

- Transmission support bolts/screws (841) to 34 N.m (25 lb. ft.).
11. Shims (893), mount (890), washers (891) and transmission mount bolts/screws (892).

Tighten

- Transmission mount bolts/screws (892) to 47 N.m (35 lb. ft.).
12. Transmission mount nut (840) and washer (864).

Tighten

- Transmission mount nut (840) to 41 N.m (30 lb. ft.).
13. Catalytic converter-to-intermediate pipe bolts/screws.

Tighten

- Catalytic converter-to-intermediate pipe bolts/screws to 34 N.m (25 lb. ft.).
14. Remove transmission jack.
 15. New flywheel bolts/screws (857).
 - A. Observe marks made during disassembly and align in original position.
 - B. Make sure weld nuts on torque converter clutch are flush with flywheel.
 - C. Test torque converter clutch for freedom of rotation.
 - D. Remove retaining compound from first three threads of new flywheel bolts/screws (857).
 - E. Finger tighten three flywheel bolts/screws (857), then tighten to specification.

Tighten

- Flywheel bolts/screws (857) to 63 N.m (46 lb. ft.).
 - Retighten first flywheel bolt/screw (857) tightened to specification.
16. Catalytic converter support bracket. Refer to SECTION 6F.
 17. Cover (855) and cover bolts/screws (854).

Tighten

- Cover bolts/screws (854) to 10 N.m (89 lb. in.).

Figure 29 - Transmission to Engine

18. Steering column shift control linkage to transmission. Refer to "Steering Column Shift Control Linkage" in this section.
19. Electrical leads and retaining clips.
20. Propeller shaft. Refer to SECTION 4A.
21. Lower vehicle.
22. Transmission fluid level indicator (851).

23. Battery negative cable.

Adjust

1. Shift linkage. Refer to "Steering Column Shift Control Linkage Adjustment" in this section.
2. Fluid level.
 - Fill transmission with DEXRON® III to the "COLD" fluid level reading.
 - Perform transmission fluid level checking procedure. Refer to "Transmission Fluid Level Checking Procedure" in this section.

SPECIFICATIONS

GENERAL SPECIFICATIONS

- Automatic (HYDRA-MATIC 4L60-E) Fluid Refill Capacity
- Bottom Pan Removal 4.7 liters (5.0 qt.)
- Complete Overhaul (with new 298 mm torque converter) 10.6 liters (11.0 qt.)

LIGHTING SYSTEMS AND HORNS

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fastener that require a replacement after removal. General Motors will also call out the fasteners that require thread locker or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and system.

GENERAL DESCRIPTION

HALOGEN BULBS

Headlamp capsules of all vehicles and the spotlamp for police and taxi vehicles contain halogen gas.

CAUTION: Halogen bulbs contain a gas under pressure. Handling a bulb improperly could cause it to shatter into flying glass fragments. To help avoid personal injury:

- Turn off the lamp switch and allow the bulb to cool before changing bulbs. Leave the switch off until bulb change is complete.
- Always wear eye protection when changing a halogen bulb.
- Handle the bulb only by its base. Avoid touching the glass.
- Do not drop or scratch the bulb. Keep moisture away.
- Place the used bulb in the new bulb's carton and dispose of it properly. Keep halogen bulbs out of the reach of children.

EXTERIOR LIGHTING

The exterior lighting system includes the headlamp capsules, front parking and turn signal lamps, rear taillamps, backup lamps, rear license lamp, front sidemarker and cornering lamps, rear sidemarker lamps, rear compartment courtesy lamp (sedan), underhood lamp and the highmount stoplamp. It also includes all associated wiring, controls and related hardware for these lamps.

Backup Lamps

The backup lamps are part of the taillamp on the Chevrolet or the rear fascia on the Buick. The backup lamps are activated when the backup lamp and transmission position sensor switch is shifted to the "REVERSE" position. Refer to SECTION 7A for service of the switch.

Daytime Running Lamps

(Canadian Only)

All Canadian vehicles are equipped with daytime running lamps. The daytime running lamp system includes a solid state module, a relay and a light sensor. The system lights "LO" beam headlamps at reduced intensity when the ignition switch is in the "RUN" position during daylight. The daytime running lamp system is designed to light the "LO" beam headlamps at full intensity, and the parking lamps and taillamps when low light conditions are present.

Front Cornering Lamp

Cornering lamps provide extra light in the direction the vehicle is turning. When either the headlamps or parking lamps are on, turning on the turn signal causes the cornering lamp in the direction of the turn to light. The cornering lamps do not blink.

Front Parking Lamp

The front parking lamps are housed within the headlamp capsule. The front parking lamps can be turned on by turning the headlamp switch clockwise to the first position indicated by the parking lamp symbol, for Chevrolet. For Buick, pull headlamp knob out to first position.

Front Sidemarker Lamp

The front sidemarker lamps will come on when the headlamps or parking lamps are on. The front sidemarker lamps also have reflectors: they will shine when struck by light, whether or not the vehicle's lamps are on.

If the headlamp switch or parking lamps are off when a turn is signaled, the appropriate front sidemarker lamp will flash in unison with the front turn signal lamp on the same side. If the headlamps or parking lamps are on when a turn is signaled, the front sidemarker lamp and front turn signal lamp flash alternately.

Front Turn Signal Lamp

When the turn signals are activated, the appropriate front parking lamp flashes to signal a turn. The turn signal works only when the ignition switch is in "RUN" and the hazard flashers are turned "OFF."

The turn signals are controlled by the turn signal lever on the left side of the steering column. Moving the lever all the way up or down (past the detent) will turn on the turn signals. When the turn is completed, the lever will return to horizontal and the turn signals will stop flashing.

For changing lanes or shallow turns where the steering wheel does not turn far enough to cancel the signal, move the turn signal lever only to the first detent and hold it there. When the lever is released, it will return to horizontal and the turn signal will cancel. For more information, refer to SECTION 8A.

A tone alarm is incorporated into the turn signal electrical circuit. The tone alarm sounds if the turn signal is left on for more than 0.8 km (0.5 mile). The tone alarm will stay on for 2.4 km (1.5 miles) unless the turn signal is turned off.

Hazard Lamp Flasher

The hazard warning flasher is part of the turn signal circuit. The hazard warning switch is on the right side of the steering column. Pressing in on the hazard warning switch button causes the front and rear turn signal lamps and the front sidemarker lamps to flash. Pulling on the hazard warning switch knob will turn off the hazard warning flashers.

The hazard warning flashers will work with the ignition switch in any position. When the hazard warning flashers are "ON," the turn signals do not work. The hazard lamp flasher is in the convenience center, behind the instrument panel to the left of the steering column. For information on the hazard warning switch, refer to SECTION 3F.

Headlamp Capsules

The headlamp capsules are controlled by the headlamp switch on the left side of the instrument panel. They will come on with the ignition switch in any position.

Headlamp low beam and high beam are controlled by the headlamp dimmer switch lever on the left side of the steering column. When the headlamps are on, pulling the lever toward the driver until the switch clicks changes the lamps from low beam to high beam, or from high beam to low beam. An indicator lamp on the center instrument cluster will come on when the high-beam headlamps are on.

The headlamps must be aimed for proper illumination of the road. Headlamp aim should be checked whenever a new headlamp capsule is installed or service or repairs to the front end area may have disturbed the headlamp capsule or its mountings.

Important

- Some state and local laws specify requirements for headlamp aim: these laws must be followed.

High-Mount Stoplamp

The high-mount stoplamp is in the center of the rear window panel between the rear seatback and the rear window in sedans. For wagons, it is located in the bottom center of the end gate window. It will come on

whenever the brake pedal is pushed down. The lamp is powered separately from the rear taillamps through a circuit in the stoplamp switch.

Opera Lamps

(Buick Sedan)

Opera lamps are mounted on the roof rear quarter upper panel. These lamps will light when the headlamp switch is in the "PARK" or "ON" position.

Rear Compartment Courtesy Lamp

(Sedan)

This lamp will come on whenever the rear compartment lid is opened, even if the headlamps or parking lamps are not on.

Rear Compartment Lid Lamps

(Police)

The rear compartment lid lamp system consists of two 4-inch red lensed single faced lamps, a warning lamp flasher and a mercury switch all mounted to the rear compartment lid inner panel. Powered by the rear compartment courtesy lamp wiring, the lamps are activated by the mercury switch when the rear compartment lid is opened. The warning lamp flasher causes the lamps to flash alternately.

Rear License Lamp

The rear license lamp will come on when the headlamps or parking lamps are on. The license lamp is mounted above the license plate.

Rear Sidemarker Lamps

The rear sidemarker lamps are part of the taillamp. The rear sidemarker lamps will come on when the headlamps or parking lamps are on. The rear sidemarker lamps also have reflectors: they will shine when struck by light, whether or not the vehicle's lamps are on.

Rear Window Panel Lamps

(Police)

The rear window panel lamp system consists of two 4-inch, red lensed lamps and two 30 amp BOSCH® relays. These relay controlled lamps function as auxiliary turn signals and stoplamps. The lamps are mounted to the rear window panel trim. The relays are mounted in the rear compartment, on the left side inner brace.

Spotlamp

(Police and Taxi)

Pillar mounted spotlamps are available on police and taxi equipped vehicles. Each lamp contains a 50 watt independently fused halogen bulb.

8B-4 LIGHTING SYSTEMS AND HORNS

Taillamps

The taillamps, stoplamps, and turn signal lamps are part of the taillamp.

Turning on either the headlamps or parking lamps will turn on the taillamps. When the brake pedal is pushed down, the taillamps glow brighter to serve as stoplamps.

The turn signals are controlled by the turn signal lever on the left side of the steering column. Moving the lever all the way up or down (past the detent) will turn on the turn signals. When the turn is completed, the lever will return to neutral and the turn signals will stop flashing. If the brake pedal is held down when a turn is signaled, one side will flash and the other will stay on brightly.

For changing lanes or shallow turns where the steering wheel does not turn far enough to cancel the signal, move the lever only to the first detent. When the lever is released, it will return to neutral and the turn signals will cancel.

Turn Signal Lamp Flasher

The turn signal lamp flasher is in the convenience center, behind the instrument panel to the left of the steering column.

Twilight Sentinel

The twilight sentinel option provides automatic on-off control of the headlamps. It will also keep the lamps turned on for a preselected period of time after the ignition is turned "OFF." For further information, refer to SECTION 9C.

Underhood Lamp

The underhood lamp will come on when the hood is raised, whether or not the parking lamps or headlamps are on.

INTERIOR LIGHTING

For information on warning/indicator lamps, instrument cluster lamps, etc., refer to SECTION 8C. For circuit information, refer to SECTION 8A.

Ashtray Lamp

The ashtray lamp is mounted on the ashtray retainer in the instrument panel. It lights when the headlamps are on and the ashtray is opened.

Courtesy Lamps

Courtesy lamps are located in the lower part of each front door and under both sides of the instrument panel. They will come on when any door is opened or when the interior lamps are turned on. To turn on the courtesy lamps, rotate the "INTERIOR LIGHTS" thumbwheel switch on the Chevrolet, located as part of the headlamp switch, to its full "UP" position. For Buick, rotate headlamp knob counterclockwise until lights click on. Rotating the thumbwheel switch or headlamp knob also controls the instrument panel lamps and their intensity.

Dome and Reading Lamps

The dome lamp on the Chevrolet is on the roof between the front seats. It will come on when a door is opened, or when the inside lamps are turned on. To turn on the inside lamps, rotate the "INTERIOR LIGHTS" thumbwheel switch full "UP."

The police vehicle may be equipped with a secondary dome lamp located on the headlining panel between the sunshades. This lamp has its own switch and does not come on with the courtesy lamps.

The front reading lamps are part of the inside rearview mirror. Push the switch to turn a reading lamp on or off, when the doors are closed. With the doors opened, the reading lamps are always on. The rear reading lamps are located in the roof rail courtesy and reading lamps. They can be turned on by pressing the switch on the lamp.

For more information on the dome and reading lamps, refer to SECTION 10-2 and SECTION 10-9.

Instrument Panel Compartment Lamp

The instrument panel compartment lamp lights when the instrument panel compartment door is opened.

Rear Compartment Lamps

(Wagon)

These lamps are part of the back body pillar assist handles. The lamps will come on when the end gate is opened or by turning the switch on.

Vanity Mirror

The vanity mirror lamps light when the passenger side sunshade is lowered and the mirror cover door is raised. The lamps turn off when the mirror cover door is closed.

HEADLAMP SWITCH

Rotating the headlamp switch clockwise on the Chevrolet or pulling out the headlamp knob on the Buick turns on the headlamps, parking lamps, sidemarker lamps and instrument panel lamps. If the switch is on when the ignition switch is off, a warning tone will sound as a reminder to turn the lamps off.

HORNS

Pushing the pads on the lower left or right hand center of the steering wheel sounds the horns by closing the horn relay. The horns use a solenoid-operated diaphragm to generate sound. For wiring and circuit information refer to SECTION 8A.

DIAGNOSIS

For wiring diagrams and other diagnosis information on properly repairing wiring harnesses, connectors, etc., refer to SECTION 8A.

LIGHTING SYSTEM TROUBLESHOOTING

Most lighting problems are caused by loose connectors, open or shorted wiring, burned-out bulbs, bad switches, an inadequate ground or blown fuses. Check these items first and then refer to SECTION 8A.

HORNS

If the horns do not blow, or blow constantly, follow the diagnostic procedures in SECTION 8A.

Horn Tone Poor

1. Horn tone poor - tighten horn bolts/screws in mounting area, or correct poor connections or ground.
2. Low-pitched moan - sounds like "mooring." Caused by current too high. Adjust current. See "Horns" under "On-Vehicle Service" in this section.
3. Weak tone - current too low. Correct poor connections or ground, or adjust current. See "Horns" under "On-Vehicle Service" in this section.
4. Weak, strained tone - remove foreign object in horn.
5. Harsh vibration - bend bracket so horn is touching sheet metal.

ON-VEHICLE SERVICE

When replacing a part that requires a special procedure (such as a lens and housing sealed together), follow the instructions normally included in the replacement parts package.

When removing a part that requires special sealing items (such as sealing washers), be sure to reinstall those items when replacing the part. Also, if

any body sealing items (grommets, etc.) are disturbed, be sure to repair them so the passenger compartment remains properly sealed.

Take care to prevent waterleaks if sealing surfaces are disturbed. Damaged gaskets must be replaced. If necessary, use sealer (body caulking compound or equivalent) in critical areas or any area where the gasket doesn't seal properly.

CAUTION: Before removing or installing any electrical unit(s), disconnect the negative battery cable to help prevent personal injury and/or damage to the vehicle or its components.

EXTERIOR LIGHTING

Backup Lamps

To replace a backup lamp bulb, refer to "Taillamps" in this section.

Front Parking and Turn Signal Lamp Bulb Replacement

(Except Buick Sedan)

Figure 1

 Remove or Disconnect

1. Electrical connector from headlamp capsule (17) by twisting counterclockwise.
2. Bulb (4) from electrical connector.

Figure 1 - Headlamp Capsule

8B-6 LIGHTING SYSTEMS AND HORNS

Install or Connect

1. Bulb (4) to electrical connector.
2. Electrical connector to headlamp capsule (17) by twisting clockwise.

Front Parking and Sidemarkers Lamp Bulb Replacement

(Buick Sedan)

Figure 2

Remove or Disconnect

1. Bolt/screw attaching lamp (73) to headlamp bracket.
2. Forward lamp wiring harness connector from front parking and sidemarkers lamp connector.
3. Lamp (73) from headlamp bracket.
 - Disengage spring clip and pull forward.
4. Electrical connector from lamp.
5. Bulb from electrical connector.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulb into electrical connector, if removed.
2. Electrical connector into lamp (73).
3. Lamp (73) into headlamp bracket.
 - Engage spring clip.
4. Forward lamp wiring harness connector to front parking and sidemarkers lamp connector.
5. Bolt/screw attaching lamp (73) to headlamp bracket.

Tighten

- Bolt/screw to 2.3 N.m (20 lb. in.).

Figure 2 - Front Parking and Sidemarkers Lamps-
(Buick Sedan)

Front Sidemarkers and Cornering Lamp Bulb Replacement

(Except Buick Sedan)

Figure 3

Remove or Disconnect

1. Bolt/screw (22) from bracket (12).
2. Lamp (36) by pulling forward.
3. Electrical connectors from lamp (36).
4. Bulb (38 or 39), as necessary, from electrical connectors.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulb (38 or 39), as necessary, to electrical connectors.
2. Electrical connectors to lamp (36).

Figure 3 - Front Sidemarkers and Cornering Lamps-
(Except Buick Sedan)

3. Lamp (36).
4. Bolt/screw (22) to bracket (12).

 Tighten

- Bolt/screw (22) to 1.3 N.m (12 lb. in.).

Front Turn Signal and Cornering Lamp Bulb Replacement

(Buick Sedan)

Figure 4

 Remove or Disconnect

1. Bolt/screw (74) from bracket (75).
2. Lamp (76) by pulling forward.
3. Electrical connectors from lamp (76).
4. Cornering lamp bulb (77) or parking and turn signal lamp bulb (78) from electrical connectors.

 Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Cornering lamp bulb (77) or parking and turn signal lamp bulb (78) from electrical connectors.
2. Electrical connectors to lamp (76).
3. Lamp (76).
4. Bolt/screw (74) to bracket (75).

Figure 4 - Front Turn Signal and Cornering Lamps-(Buick Sedan)

 Tighten

- Bolt/screw (74) to 1.3 N.m (12 lb. in.).

HAZARD LAMP FLASHER

Figure 5

 Remove or Disconnect

- Hazard lamp flasher (66) by pulling from convenience center.

 Install or Connect

- Hazard lamp flasher (66) to convenience center.

HEADLAMP CAPSULES

Bulb Replacement

Figure 1

CAUTION: Refer to CAUTION under "Halogen Bulbs" in this section.

 Remove or Disconnect

1. Retainer (9) from headlamp capsule (17) by twisting counterclockwise.
2. Bulb (11) from headlamp capsule (17).
3. Bulb (11) from electrical connector.

 Install or Connect

1. Bulb (11) to electrical connector.
2. Bulb (11) to headlamp capsule (17).
3. Retainer (9) to headlamp capsule (17) by twisting clockwise.

Composite Capsule Replacement

 Remove or Disconnect

1. Front sidemarkers and cornering lamp. Refer to "Front Sidemarkers and Cornering Lamps" (Except Buick Sedan) in this section.
2. Front turn signal and cornering lamp. Refer to "Front Turn Signal and Cornering Lamps (Buick Sedan)" in this section.
3. Front parking and sidemarkers lamp. Refer to "Front Parking and Sidemarkers Lamps (Buick Sedan)" in this section.
4. Electrical connector from headlamp capsule (17).
5. Retainer (9) from headlamp capsule (17).
6. Bulb (11) from headlamp capsule (17).
7. Nut (16) from bolt/screw (14).
8. Two bolts/screws (6) from nut (15) behind bracket (12).
9. Headlamp capsule (17) from bracket (12).
 - By pulling forward and disengaging slide pivots from slots in bracket (12).

8B-8 LIGHTING SYSTEMS AND HORNS

Install or Connect

1. Headlamp capsule (17) to bracket (12).
 - Be sure slide pivots are engaged into bracket (12).
2. Two bolts/screws (6) to nut (15) behind bracket (12).
3. Nut (16) to bolt/screw (14).
4. Bulb (11) to headlamp capsule (17).
5. Retainer (9) to headlamp capsule (17).
6. Electrical connector to headlamp capsule (17).
7. Front sidemarker and cornering lamp. Refer to "Front Sidemarker and Cornering Lamps" (Except Buick Sedan) in this section.
8. Front turn signal and cornering lamp. Refer to "Front Turn Signal and Cornering Lamps (Buick Sedan)" in this section.
9. Front parking and sidemarker lamp. Refer to "Front Parking and Sidemarker Lamps (Buick Sedan)" in this section.

Important

- When replacing headlamp capsule and/or bracket, headlamp aiming should be adjusted. Refer to "Headlamp Aiming" in this section.

HEADLAMP BRACKET REPLACEMENT

Remove or Disconnect

1. Headlamp capsule. Refer to "Composite Headlamp Capsule Replacement" in above procedure.
2. Four bolts/screws (7).
3. Shim (67), if present.
4. Bracket (12).
 - Remove two J-nuts from bracket (12) for reuse, if replacing bracket (12).

Figure 5 - Hazard and Turn Signal Lamp Flashers-(Typical)

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bracket (12).
 - Install two J-nuts on bracket (12), if removed.
2. Shim (67).
 - Necessary if gap between fender and bracket is greater than 1 mm (1/32 inch).
3. Four bolts/screws (7).

Tighten

- Bolts/screws (7) to 5 N·m (44 lb. in.).
4. Headlamp capsule. Refer to "Composite Headlamp Capsule Replacement" in above procedure.

HEADLAMP AIMING

Figures 6 and 7

Horizontal aim is corrected by an adjusting screw on the outer side of the headlamp capsule. Vertical aim is corrected by an adjusting screw in the top center.

Visual Aiming Equipment

If visual aiming equipment is used, it must give results equivalent to those obtained using the screen method described in the following procedure.

The equipment must be in proper working order, and used in accordance with the manufacturer's instructions. The aiming equipment, using a photoelectric cell or cells to determine aim, should also have a visual screen upon which the beam pattern is projected proportional to its appearance and aim on a screen at twenty-five feet. This screen should be plainly visible to the operator, and should have horizontal and vertical reference lines to allow for visual appraisal of the headlamp beam.

Headlamp Aiming By Screen Method

It is desirable to have a specific aiming area in a darkened location. This area should be large enough to accommodate the vehicle, plus an additional 25 feet measured from the face of the headlamp capsules to the front of the visual screen.

- The floor on which the vehicle rests must be flat with the bottom of the screen. If the floor is not level, then compensation must be made.
- The aiming screen should be 5 feet high by 12 feet wide with a matte white surface, well shaded from outside light, and properly adjusted to the floor on which the vehicle stands. The screen must be provided with a vertical center line, two laterally adjustable vertical tapes, and a vertically adjustable horizontal tape.

Figure 6 - Visual Headlamp Aiming Preparation

! Important

- For each vehicle checked, the horizontal line or tape on the screen must be adjusted. Vehicles of the same model and year will have different standing height for the capsules.
 - Provisions should be made for moving the screen, so that it can be aligned parallel with the rear axle. This will allow for a horizontal line drawn perpendicular from the center line of the screen to pass through the center point between the two capsules.
 - Once the screen has been set up in a permanent location, a reference line is to be painted on the floor to identify the proper location of the capsules when they are being aimed (Figure 7).
 - If a regular commercial aiming screen is not available, the screen may consist of a vertical wall having clear uninterrupted area approximately 6 feet high by 12 feet wide, finished with a washable non-gloss white paint.
1. Prepare vehicle for checking beam aim as follows:
 - A. Completely assemble all components on vehicle.
 - B. Fuel load to be 1/2 tank or less.
 - Only other load in vehicle is the driver.
 - C. Position vehicle so it is square with aiming screen, and with the headlamp capsules directly over reference line which has been painted on floor.

Figure 7 - Visual Headlamp Aim Adjustment and Limits

8B-10 LIGHTING SYSTEMS AND HORNS

D. Locate vertical center line on aiming screen so that it is in line with center of vehicle. This can be done by sighting through center of rear window and over hood (Figure 7).

E. Mark center of front and rear windows with narrow tape. Use these "sights" to locate center of vehicle.

- Move the vehicle or the screen until the center line of the screen comes into alignment with these two points.

F. Close doors.

G. Rock vehicle sideways to stabilize suspension.

2. Switch headlamps on to low beam, and observe left and top edges of high intensity zone on screen.

Adjust

- Horizontal aim using horizontal adjusting screw, if left edge is more than:
 - 102 mm (4 inches) RIGHT of straight ahead.
 - 102 mm (4 inches) LEFT of straight ahead.
- Vertical aim using vertical adjusting screw, if top edge is more than:
 - 102 mm (4 inches) ABOVE the horizontal line.
 - 102 mm (4 inches) BELOW the horizontal line.

HIGH-MOUNT STOPLAMP BULB REPLACEMENT

(Chevrolet Sedan)

Figures 8, 9 and 10

For replacement of high-mount stoplamp (Except Buick Sedan), refer to SECTION 10-8. For Buick Sedan refer to the following procedure in this section.

Remove or Disconnect

1. Bulb (2) and electrical connector from under rear window panel (1), through rear compartment.
 - Twist electrical connector 1/4 turn counterclockwise to unlock.
2. Bulb (2) from electrical connector.

Install or Connect

1. Bulb (2) into electrical connector.
2. Bulb (2) and electrical connector into rear window panel (1), through rear storage compartment.
 - Twist electrical connector 1/4 turn clockwise to lock.

(Wagons)

Remove or Disconnect

1. Two bolts/screws (63) from high-mount stoplamp.
2. Bulbs from socket.

Figure 8 - High-Mount Stoplamp-(Chevrolet Sedan)

Install or Connect

1. Bulbs into socket.
2. Two bolts/screws (63) into high-mount stoplamp.

(Buick Sedan)

Figure 9

Remove or Disconnect

1. Cover (81) from stoplamp (80).
 - Unclip from rear window panel (82) and stoplamp (80).
 - Remove bulb, if necessary.
2. Bolts/screws (79) attaching stoplamp (80) to rear window panel (82).
3. Electrical connector.
4. Stoplamp (80).

Install or Connect

1. Stoplamp (80).
2. Electrical connector.
3. Bolts/screws (79) attaching stoplamp (80) to rear window panel (82).
 - Loosely attach bolts/screws (79) and pull stoplamp (80) rearward.

Figure 9 - High-Mount Stoplamp-(Buick Sedan)

Tighten

- Bolts/screws (79) to 1.5 N.m (13 lb. in.).
- 4. Replace bulbs, if removed.
- 5. Cover (39) to stoplamp (38).
 - Snap clips into stoplamp (38) then to rear window panel (40).

OPERA LAMPS

(Buick Sedan)

Figure 11

Remove or Disconnect

1. Reposition rear compartment trim to access nut (86 or 87).
2. Nut (86 or 87) from bezel stud.
3. Quarter upper trim. Refer to SECTION 10-7.
4. Nut (86 or 87) from bezel stud.
5. Opera lamp (84) from underbody.
6. Electrical connector.
7. Washers (85) from bezel stud.
8. Opera lamp (84) from bezel (83).

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Opera lamp (84) to bezel (83).
2. Washers (85) to bezel studs.
3. Electrical connector.
4. Opera lamp (84) to body.
5. Nuts (86 or 87) to bezel studs.

Figure 10 - High-Mount Stoplamp-(Wagon)

Tighten

- Nuts (86 or 87) to 3 N.m (27 lb. in.).
- 6. Quarter upper trim. Refer to SECTION 10-7.
- 7. Reposition rear compartment trim.

REAR COMPARTMENT COURTESY LAMP

(Sedan)

Lamp Replacement

Figure 12

Remove or Disconnect

1. Bolt/screw (41) holding lamp (44).
2. Lamp (44).
3. Electrical connector.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Electrical connector.
2. Lamp (44).
3. Bolt/screw (41) to lamp (44).

Tighten

- Bolt/screw (41) to 2 N.m (18 lb. in.).

Bulb Replacement

Remove or Disconnect

- Bulb (45) from lamp (44).

Install or Connect

- Bulb (45) into lamp (44).

8B-12 LIGHTING SYSTEMS AND HORNS

Figure 14

Remove or Disconnect

1. Two bolts/screws (21) from lamp (20).
2. Lamp (20) from rear compartment lid.
3. Electrical connector from lamp (20).
4. Bulb (19) from electrical connector.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulb (19) to electrical connector.
2. Electrical connector into lamp (20).
3. Lamp (20) to rear compartment lid.
4. Two bolts/screws (21) to lamp (20).

Tighten

- Bolts/screws (21) to 1.3 N.m (12 lb. in.).

(Wagon)

For replacement of rear license lamp molding, refer to SECTION 10-8.

Remove or Disconnect

1. Two bolts/screws attaching lens to molding.
2. Lamp from molding.
3. Bulb from lamp.
4. Repeat steps 1, 2, and 3 for second bulb, if necessary.

Install or Connect

1. Bulb into lamp.
2. Lamp into molding.
3. Two bolts/screws attaching lens to molding.
4. Repeat steps 1, 2, and 3 for second bulb, if necessary.

REAR SIDEMARKER LAMPS

To replace a rear sidemarker lamp bulb, refer to "Taillamps" in this section.

REAR WINDOW PANEL LAMPS (POLICE)

Lamp Replacement

Figure 15

Remove or Disconnect

1. Rear seat cushion and seatbacks. Refer to SECTION 10-10.
2. Electrical connector.

Figure 14 - Rear License Lamp-(Sedan)

3. Bolts/screws (110) attaching bracket (111) to rear window panel (1).
4. Bracket (111) with attached lamp (108).

Install or Connect

1. Bracket (111) with attached lamp (108).
2. Bolts/screws (110) attaching bracket (111) to rear window panel (1).
3. Electrical connector.
4. Rear seat cushion and seatbacks. Refer to SECTION 10-10.

Lens and Bulb Replacement

Remove or Disconnect

1. Lens retaining clip.
2. Lens.
3. Bulb.

Install or Connect

1. Bulb.
2. Lens.
3. Lens retaining clip.

Figure 15 - Rear Window Panel Lamps-(Police)

SPOTLAMP (POLICE AND TAXI)

Figure 16

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in Section 0A.

1. Battery negative cable.
2. Screw (129) from wedge key nut.
3. Wedge key nut from handle (130).
4. Handle (130) from the outer tube shaft.
5. Collar (131).
6. Wire clip (132).
7. Escutcheon (133).
8. Electrical connector.
9. Bracket clamp screw (127) from bracket (124).
10. Spotlamp (120) and shaft by pulling out of bracket (124).

11. Bolts/screws (123) attaching bracket (124), gasket (125) and opening cover (126) to "A" pillar.
12. Bracket (124), gasket (125) and opening cover (126) from "A" pillar.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bracket (124), gasket (125) and opening cover (126) to "A" pillar.
2. Bolts/screws (123) attaching bracket (124), gasket (125) and opening cover (126) to "A" pillar.

Tighten

- Bolts/screws (123) to 1.7 N.m (15 lb. in.).
3. Position spotlamp (120) and shaft in bracket (124) with a 90 mm (3.5 inch) spacing between spotlamp (120) and bracket (124).

5-10-94
BS0168B

Figure 16 - Spotlamp-(Police and Taxi)

4. Rotate spotlight (120) to upright position with spotlight (120) pointing forward.
5. Bracket clamp bolt/screw (127) to bracket (124).
 - Tighten bracket clamp bolt/screw (127) just enough to hold spotlight (120) firmly in upright position.
6. Escutcheon (133), wire clip (132) and collar (131) onto shaft and tighten collar setscrew securely.
 - Must be installed after windshield garnish molding. Refer to SECTION 10-9.
7. Adjust spotlight head clamping screw (128) to permit spotlight (120) to rotate on shaft using slight force.
8. Check spotlight wedge key to assure that internal key notch is aligned with handle hole to permit passage of spotlight outer tube shaft.
9. Electrical connector.
10. Handle (130) onto shaft and engage two detents.
 - A. Rotate handle (130) slowly until inner key engages with inner tube shaft slot.
 - B. Then rotate handle (130) until outer tube shaft engages outer key with parkstop-backstop notch in outer tube shaft.
 - C. After detents are engaged, position handle (130) downward and vertically aligned with spotlight head axis.
11. Wedge key nut to secure handle (130) to shaft.
12. Bolt/screw (129) into wedge key nut.

Tighten

- Bolt/screw (129) to 6 N.m (53 lb. in.).
13. Battery negative cable.

Spotlamp Bulb

CAUTION: Refer to **CAUTION** under “Halogen Bulbs” in this section.

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in Section 0A.

Remove or Disconnect

1. Battery negative cable.
2. Spotlight bezel retaining screw.
3. Spotlight bulb and bezel from spotlight housing.
4. Electrical connectors.
5. Spotlight bulb from bezel.

Install or Connect

1. Spotlight bulb into bezel.
2. Electrical connectors.
3. Spotlight bulb and bezel into spotlight housing.
4. Spotlight bezel retaining screw.
5. Battery negative cable.

Spotlamp Switch

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in Section 0A.

1. Battery negative cable.
2. Switch cover retaining screws.
3. Switch cover.
 - Cut wire at switch.

Install or Connect

1. Splice wires and solder.
2. Switch cover.
3. Switch cover retaining screws.
4. Battery negative cable.

Spotlamp Travel Adjustment

Figure 16

Adjust

- Spotlight travel.
 - A. Loosen bracket clamp bolt/screw (127).
 - B. Grasp the spotlight (120) and rotate it slowly inboard until shaft contacts parkstop.
 - C. Slowly rotate spotlight (120) outboard to a position 5 degrees past vertical, so backstop is in motion and outer tube shaft is forced to rotate.
 - D. Tighten bracket clamp bolt/screw (127) enough to prevent outer shaft tube from rotating while spotlight (120) is moving between stop positions.
 - E. Rotate spotlight head inboard to position parkstop so as to prevent spotlight (120) from coming in contact with body components.
 - F. The parkstop of shaft must be positioned, so that spotlight (120) can be rotated on its axis and clear nearest body components by 13 mm to 0.5 mm (0.50 inch to 0.02 inch).
 - G. When parkstop has been set, tighten bracket clamp screw (127) to prevent spotlight shaft from being rotated.

Tighten

- Bracket clamp bolt/screw (127) to 10 N.m (89 lb. in.).
- H. Adjust spotlight head clamping bolt/screw (128) to allow easy rotation of spotlight (120) on shaft, but it must hold spotlight (120) in any adjusted position between parkstop and backstop. (Total motion of spotlight head is approximately 90 degrees).

Tighten

- Head clamping bolt/screw (128) to 3.3 N.m (29 lb. in.).

8B-18 LIGHTING SYSTEMS AND HORNS

TAILLAMP BULB REPLACEMENT

Figures 17 through 20

Take care to prevent waterleaks if sealing surfaces are disturbed. Damaged gaskets must be replaced. If necessary, use sealer (body caulking compound or equivalent) in critical areas or any area where gasket doesn't seal properly.

(Chevrolet Sedan)

Remove or Disconnect

1. Convenience net retainers (23).
2. Bolt/screw (25).
3. Taillamp (24) from vehicle.
4. Electrical connectors, as necessary, from taillamp (24).
5. Bulbs (31 through 33), as necessary, from electrical connectors.
6. Rosebud clips from taillamp (24), if replacing taillamp (24).

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Rosebud clips to taillamp (24), if replacing taillamp (24).

2. Bulbs (31 through 33), as necessary, to electrical connectors.
3. Electrical connectors, as necessary, from taillamp (24).
4. Taillamp (24) to vehicle.
5. Bolt/screw (25).

Tighten

- Bolt/screw (25) to 5 N.m (44 lb. in.).

6. Convenience net retainers (23).

Tighten

- Convenience net retainers (23) to 2.5 N.m (22 lb. in.).

(Buick Sedan)

Remove or Disconnect

1. Reposition rear compartment trim.
2. Nuts (88).
3. Taillamp (93) from vehicle.
4. Electrical connectors, as necessary, from taillamp (95).
5. Bulbs (89 through 92), as necessary, from electrical connectors.

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulbs (89 through 92), as necessary, to electrical connectors.
2. Electrical connectors, as necessary, to taillamp (93).
3. Taillamp (93) to vehicle.
4. Nuts (88).

Tighten

- Nuts (88) to 5 N.m (44 lb. in.).
5. Reposition rear compartment trim.

(Wagon)

Remove or Disconnect

1. Open end gate window and lower end gate.
2. Trim panels. Refer to SECTION 10-7.
3. Nut (68).
4. Two bolts/screws (69).
5. Taillamp (70 or 71) from vehicle.
6. Electrical connectors from taillamp (70 or 71).
7. Bulb (31, 32 or 33), as necessary, from electrical connectors.

NOTICE: Refer to "Notice" on page 8B-1 of this section.

Install or Connect

1. Bulb (31, 32, or 33), as necessary, into electrical connectors.
2. Electrical connectors into taillamp (70 or 71).
3. Taillamp (70 or 71) to vehicle.
4. Two bolts/screws (69).

Tighten

- Bolts/screws (69) to 2 N.m (18 lb. in.).
5. Nut (68).

Tighten

- Nut (68) to 5 N.m (44 lb. in.).
6. Trim panels. Refer to SECTION 10-7.
 7. Raise end gate and close end gate window.

BACKUP LAMPS

Bulb Replacement

For Chevrolet or Buick refer to "Taillamps" in this section

(Buick Sedan)

Remove or Disconnect

1. Electrical connector from lamp (115).
2. Bulb (114) from electrical connector.

Figure 19 - Backup Lamp-(Buick Sedan)

5-10-94
 BS02068

Figure 20 - Taillamps-(Wagon)

Install or Connect

1. Bulb (114) into electrical connector.
2. Electrical connector to lamp (115).

Lamp Replacement

Remove or Disconnect

1. Electrical connector from lamp (115).
2. Rear fascia. Refer to SECTION 10-4.
3. Nuts (117) attaching lamp (115) to center molding stud.
4. Lamp (115) from rear fascia (116).

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Lamp (115) to rear fascia (116).
2. Nuts (117) attaching lamp (115) to center molding stud.

Tighten

- Nuts (117) to 4 N.m (35 lb. in.).
3. Rear fascia. Refer to SECTION 10-4.
 4. Electrical connector to lamp (115).

TURN SIGNAL LAMP FLASHER

Figure 5

Remove or Disconnect

- Turn signal lamp flasher (65) from convenience center.

Install or Connect

- Turn signal lamp flasher (65) to convenience center.

WARNING LAMP FLASHER

Remove or Disconnect

- Warning lamp flasher (114) from connector.

Install or Connect

- Warning lamp flasher (114) into connector.

UNDERHOOD LAMP

Lamp Replacement

Figure 21

Remove or Disconnect

1. Electrical connector.
2. Rivets (48), using drill and 1/8-inch drill bit.
3. Underhood lamp (46).

Figure 21 - Underhood Lamp

Install or Connect

1. Underhood lamp (46).
2. Rivets (48).
3. Electrical connector.

Bulb Replacement

Remove or Disconnect

1. Lens (47).
2. Bulb (50).

Install or Connect

1. Bulb (50).
2. Lens (47).

INTERIOR LIGHTING

For information on warning/indicator lamps, instrument cluster lamps, etc., refer to SECTION 8C. For circuit information, refer to SECTION 8A.

Ashtray Lamp Bulb Replacement

Figure 22

Remove or Disconnect

1. Ashtray (51).
2. Electrical connector from ashtray lamp connector by twisting electrical connector clockwise and pulling it out.
3. Bulb (53) by twisting counterclockwise.

Install or Connect

1. Bulb (53).
2. Electrical connector to ashtray lamp connector.
3. Ashtray (51).

Figure 22 - Ashtray Lamp Replacement-(Typical)

Front Door Courtesy Lamps

Remove or Disconnect

1. Lens from front side door left/right trim.
2. Bulb from electrical connector.

Install or Connect

1. Bulb into electrical connector.
2. Lens to front side door left/right trim.

Instrument Panel Courtesy Lamps

Figure 23

Remove or Disconnect

1. Instrument panel sound insulator panel, if necessary. Refer to SECTION 8C.
2. Bolt/screw (97) attaching lamp (96) to instrument panel carrier.
3. Bulb (95) from lamp (96).

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulb (95) to lamp (96).
2. Bolt/screw (97) attaching lamp (96) to instrument panel carrier.

Tighten

- Bolt/screw (97) to 1.9 N-m (17 lb. in.).
3. Instrument panel sound insulator panel, if necessary. Refer to SECTION 8C.

Dome Lamp Bulb Replacement (Chevrolet)

Remove or Disconnect

1. Lens.
 - Carefully insert small screwdriver between housing and lens at front or rear (at sides, if police or taxi vehicle) to disengage and remove.
2. Bulb from terminal clips.

Install or Connect

1. Bulb to terminal clips.
2. Lens.
 - A. Engage front edge of lens to dome lamp housing.
 - B. Carefully squeeze lens to engage rear edge of lens.
 - Carefully squeeze sides of lens, for police or taxi vehicle, to engage edge of lens.

LAMP REPLACEMENT

For replacement of dome lamp assembly, refer to SECTION 10-9.

Front Reading Lamps Bulb Replacement

CAUTION: Electrochromic material may irritate eyes and skin. In case of contact, take the following action: Eye contact -rinse thoroughly with water. Skin contact - wash with soap and water. If ingested - consult a physician immediately.

Remove or Disconnect

1. Inside rearview mirror lamp housing bolt/screw.
2. Inside rearview mirror lamp housing.
3. Inside rearview mirror lamp bulb.

Figure 23 - Instrument Panel Courtesy Lamp-(Typical)

Install or Connect

1. New inside rearview mirror lamp bulb.
2. Inside rearview mirror lamp housing.
3. Inside rearview mirror lamp housing bolt/screw.
 - Tighten securely.

Roof Rail Courtesy and Reading Lamp Bulb Replacement

Remove or Disconnect

1. Bolt/screw attaching roof rail courtesy and reading lamp to roof rail.
2. Electrical connector.
3. Bezel from lamp.
 - Insert a screwdriver in access hole to disengage.
4. Lens carrier from back housing.
 - Insert screwdriver between back housing and lens carrier to disengage.
5. Lamp socket from lens carrier.
6. Bulb from lamp socket.

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Bulb into lamp socket.
2. Lens socket into lens carrier.
3. Lens carrier into back housing.
 - Snap into place.
4. Lamp to bezel.
 - Carefully snap into place.
5. Electrical connector.
6. Bolt/screw attaching roof rail courtesy and reading lamp to roof rail.

Instrument Panel Compartment Panel Compartment Lamp Bulb Replacement

Remove or Disconnect

1. Retainer attaching switch to instrument panel carrier.
2. Bulb from switch.

Install or Connect

1. Bulb into switch.
2. Retainer with attached switch into instrument panel carrier.
 - Gently snap into place.

Rear Compartment Lamps (Wagon)

BACK BODY PILLAR ASSIST HANDLE LAMPS

Remove or Disconnect

1. Lens.
 - Insert a small screwdriver into top of lens to disengage from handle and remove.
2. Bulb from socket.

Install or Connect

1. Bulb into socket.
2. Lens.
 - Insert bottom of lens into handle and then snap into place.

Vanity Mirror Bulb Replacement

Remove or Disconnect

1. Lamp lens.
 - Insert a small screwdriver at bottom edge of lamp lens to unsnap.
2. Bulb.

Install or Connect

1. Bulb.
2. Lamp lens.
 - Insert top of lamp lens and snap in bottom.

HORNS

Current Adjustment

Figure 24

Current draw for a horn while operating should be 4.5 to 5.5 amperes at 11.5 to 12.5 volts. High current (more than 20 amperes) indicates an overheated winding or shorted horn; replace the horn. A current reading of about 18 amperes means contact points are not opening; adjust horn current.

Figure 24 - Horn Adjustment

03-22-95
880248B

8B-24 LIGHTING SYSTEMS AND HORNS

No current reading indicates a broken connection or an open circuit due to a broken lead or overheated horn. An overheated horn must be replaced. No current reading may also mean contact points are open: adjust horn.

Adjust

1. Increase current - turn adjustment screw (55) clockwise.
2. Decrease current - turn adjustment screw (55) counterclockwise.
3. Current adjustments should be made 1/4 turn (90 degrees) at a time.

Horn Replacement

Figure 25

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in Section 0A.

1. Battery negative cable.
2. Bolts/screws (56) from horns (57 or 58).
3. Electrical connectors from horns (57 or 58).
4. Horns (57 or 58).

Install or Connect

NOTICE: Refer to "Notice" on page 8B-1 of this section.

1. Electrical connectors to horns (57 or 58).
2. Horns (57 or 58).
3. Bolts/screws (56) to horns (57 or 58).

Tighten

- Bolts/screws (56) to 17 N.m (13 lb. ft.).
4. Battery negative cable.

Horn Relay

Figure 5

The horn relay is in the convenience center, behind the instrument panel to left of the steering column.

Figure 25 - Horn Mounting-(Typical)

Remove or Disconnect

- Horn relay (64) from convenience center.

Install or Connect

- Horn relay (64) into convenience center.

SECTION 8C

INSTRUMENT PANEL AND GAGES

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

8C-2 INSTRUMENT PANEL AND GAGES

Ventilation, Heat and Air Conditioning	
Ducts	8C-31
Air Distributor	8C-31
Floor Air Outlet	8C-33
Windshield Defroster Nozzle	8C-33

GENERAL DESCRIPTION

CONTROLS

AM/FM STEREO AND CLOCK RADIO

Refer to SECTION 9A.

HEATER AND AIR CONDITIONING CONTROL

Refer to SECTION 1B1 or SECTION 1C.

CONVENIENCE CENTER

The convenience center is part of the body wiring harness. It is attached to a bracket located on the cowl below the instrument panel to the left of the steering column.

The audio alarm, hazard lamp flasher and turn signal lamp flasher are attached to the convenience center.

For diagnosis of the convenience center and components, refer to SECTION 8A.

FUSE BLOCK

The fuse block is a part of the body wiring harness. It is attached by a bracket on the left front hinge pillar and is accessed through a removable panel on the instrument panel.

For diagnosis, refer to SECTION 8A.

INSTRUMENT PANEL

The instrument panel is a structure that encloses and provides support for compartments, instrument cluster, controls, gages, modules and switches necessary for the safe and convenient operation and use of the vehicle.

The instrument panel is attached to the left and right-hand hinge pillars with rigid support provided by the hinge pillar tie bar (Chevrolet) or by metal brackets which are an integral part of the air distributor (Buick). A sound insulator panel conceals components under the instrument panel and provides a finished appearance.

Both the Chevrolet and Buick instrument panels have a passenger inflator module (air bag) located above the instrument panel compartment (glove box). Refer to SECTION 9J for more information.

An impact absorbing pad covers the top of the instrument panel. Trim plates accent the appearance of the face of the instrument panel.

Vehicles equipped with twilight sentinel or Canadian vehicles equipped with daytime running lamps (DRL) have a headlamp automatic control ambient light sensor installed at the bottom of the windshield defroster nozzle grille which is attached to the upper trim pad. Vehicles equipped with automatic air conditioning have a sunload temperature sensor which is mounted in the same location.

Specifications	8C-35
Fastener Tightening Specifications	8C-35
Replacement Bulbs	8C-35

The heater and air conditioning module is attached to the cowl. Air ducts connect the case outlets to a floor outlet, windshield defroster nozzle, side window defogger outlets and a high-level air outlet at the center and at each end of the instrument panel. The air distributor is concealed behind the instrument panel.

The steering column is clamped in place at the left side of the instrument panel. Below and to both sides of the steering column is an instrument panel driver knee bolster and deflector.

Instrument Cluster

The instrument cluster is centered above the steering column in the instrument panel. The instrument cluster contains gages and indicators that provide the driver with vehicle performance information.

(Chevrolet)

Gages in the instrument cluster include a fuel gage, an engine coolant temperature gage, an oil pressure gage and a voltmeter. A digital speedometer and digital trip odometer are also included.

The instrument cluster has indicator lamps for headlamp high-beam symbol, turn signal directional indicator arrows and lamps for illumination.

The cluster also contains warning indicator lamps including: "CHANGE OIL," "PASS KEY FAULT," "CHECK GAGE," "LOW" coolant symbol, "LOW" washer fluid symbol, "LOW" fuel symbol, ABS symbol, "LOW OIL LEVEL," "CHECK" engine symbol, "DOOR OPEN," "AIR BAG," "BRAKE" disc symbol, parking brake symbol, fasten seat belt symbol, hazard symbol, "GATE AJAR," if equipped.

(Buick)

Gages in the instrument cluster include a fuel gage, and an engine coolant temperature gage. An analog speedometer and trip odometer are included.

The instrument cluster has indicator lamps for the headlamp high-beam symbol, turn signal directional indicator arrows, and lamps for illumination.

The cluster also contains warning lamps including: "GATE AJAR," if equipped, "PASS KEY," "LOW COOLANT LEVEL," "HOT" temperature symbol, "LOW OIL LEVEL," "CHANGE OIL," "LOW WASH FLUID," "OIL" pressure symbol, fasten seat belt symbol, "VOLTS" battery symbol, "SERVICE ENGINE SOON," "AIR BAG," "LOW FUEL," "BRAKE" parking brake and disc brake symbols, and the ABS symbol "ANTILOCK."

Electric power is directed to the appropriate lamps and gages of the instrument cluster by a flexible printed circuit attached to the back of the instrument cluster case. Two multiple connectors join the printed circuit to the instrument panel wiring harness. The two multiple connectors and the twist-in bulb sockets help to hold the printed circuit to the back of the instrument cluster.

The instrument cluster is non-serviceable, except as noted in this section, and must be replaced as a unit.

When an instrument cluster is replaced, it is required by law that the odometer reading of the replacement unit be set to register the same mileage as the prior odometer. If the same mileage cannot be set, it is also required by law that the replacement odometer be set at zero and a label be installed on the driver's door frame showing the previous odometer reading and the date of replacement. Refer to "Odometer Repair Notice Label" in this section.

Gages

ENGINE COOLANT TEMPERATURE GAGE

The coolant temperature sending unit is mounted to the engine at a point where it is exposed to the coolant being circulated through the engine cooling passages. The sending unit contains a temperature-sensitive variable resistor that senses and reacts to coolant temperature. Resistance decreases as temperature increases.

When electric power is supplied to the engine coolant temperature gage, a current flows through the gage to the variable resistor and then to ground at the engine. The position of the gage pointer is determined by the strength of the current flowing through the gage. When the engine coolant is cold, resistance is high, the current flow is low, and the pointer indicates a cold reading. As coolant temperature increases, the resistance of the sending unit resistor decreases and the pointer moves toward the center of the gage. Prolonged driving or idling in very hot weather may cause the pointer to move beyond this point. An overheat condition exists if the pointer goes into the red zone at the upper limit of the scale.

Dial calibrations go far above the normal boiling point of water 100° C (212° F) because the cooling system is pressurized. The increase in pressure also increases the boiling temperature of the coolant, permitting it to reach temperatures above those possible with a non-pressurized system without boiling. The higher operating temperature of the cooling system that results gives greater cooling efficiency and other benefits.

FUEL GAGE

The fuel gage sending unit is mounted on the top surface of the fuel tank. The fuel level sender itself consists of a float that rides on the surface of the fuel in the tank, and a variable resistor controlled by the float arm. When electric power is supplied to the fuel gage, current flows through the gage to the variable resistor and then to ground. The position of the gage pointer is determined by the strength of the current flowing through the gage.

If the tank is full, the resistance of the variable resistor is high (90 ohms) and the current flow through the gage is at a minimum. This causes the pointer to indicate the "F" mark on the gage dial.

If the fuel level is low, the resistance of the variable resistor also is low and current flow through the gage is high. This causes the pointer to show a low fuel level reading. Intermediate fuel levels cause the pointer to indicate the corresponding position between "F" and "E."

OIL PRESSURE GAUGE

(Chevrolet)

The oil pressure gage indicates the pressure of the lubricating oil flow provided by the engine oil pump. The oil pressure gage sending unit is a variable resistor mounted to the engine block so it will sense the oil pressure in a main oil passage just downstream from the engine oil pump. When electric power is supplied to the gage, current flows through the gage to the resistor in the sending unit and then to ground at the engine block. The position of the oil pressure gage pointer is determined by the strength of the current flowing through the gage.

When oil pressure is low, the resistance of the sending unit also is low and current flow through the gage is high. This causes the gage indicator needle to show a low pressure reading. As oil pressure increases, the resistance of the sending unit resistor also increases and current flow through the gage is reduced. Under normal conditions, the oil pressure reading should be between 138 and 414 kPa (20 and 60 psi). Engine oil pressure never should fall below a reading of 28 kPa (4 psi), even at idle.

VOLTMETER

(Chevrolet)

The voltmeter is an instrument that shows the voltage of the vehicle electrical system and indicates the ability of the charging system to keep the battery charged. The voltmeter is wired in parallel with other circuits in the vehicle.

When the engine is running, the voltmeter indicates charging system voltage. If the engine is not running and the ignition switch is in the "RUN" or "START" position, the voltmeter will show battery voltage. The voltmeter can be used as a first step in diagnosing many electrical problems. Battery voltage drop can be seen while the engine is cranking. After the engine is running, generator output voltage is indicated.

It is normal for the voltmeter to read between 11 and 13 volts during extended idle or just after starting. As the electrical load is increased, or in stop-and-go driving, the pointer may rotate temporarily to the bottom of the scale. A voltmeter reading continuously below 11 volts or above 16 volts indicates an electrical system problem.

8C-4 INSTRUMENT PANEL AND GAGES

Speedometer

Both the digital and analog speedometers do not have speedometer cables. The source of speed information is a small permanent magnet alternating current generator called a Vehicle Speed Sensor (VSS), mounted on the transmission. The shaft of the VSS fits into a pinion gear at the transmission output shaft in the same manner as the speedometer cable of a mechanical speedometer system. When the transmission output shaft rotates, the VSS shaft also rotates and turns the permanent magnet near a coil within the VSS. This generates an alternating current in the coil with a frequency that is proportional to the speed of the vehicle.

The alternating current from the VSS is sent to the Powertrain Control Module (PCM). The PCM modifies the current to a series of direct current pulses at a frequency proportional to the speed of the vehicle. These pulses form a vehicle speed signal that is transmitted to the instrument cluster and cruise control module.

For analog speedometers, a solid state circuit uses the speed signal to regulate the distribution of current from the fuse block to two electromagnetic coils at right angles to each other near the base of the speedometer pointer pivot. At the base of the speedometer pointer pivot is a magnet that is acted upon by the magnetic fields of the two coils. The relative strength of the two magnetic fields determines the position of the magnet and accordingly, the position of the speedometer pointer.

Pulses from the solid state circuit also are used to drive a small electric stepper motor. The stepper motor turns the numbered wheels of the odometer and the trip odometer. The numbered wheels are geared so when any one wheel completes a revolution, the next wheel to the left is turned one-tenth of a revolution. Every tenth of a revolution advances the displayed number by one unit. The trip odometer can be reset to zero at any time so the driver can record the distance traveled from any selected starting point.

For digital speedometers, the instrument cluster displays a digital readout proportional to the vehicle speed signal pulse. The odometer's mileage information is stored in nonvolatile memory circuits within the cluster. This information is retained in these circuits even if power is lost to the cluster. Trip odometer information is stored in volatile memory circuits and will be lost whenever battery power to the cluster is lost.

INSTRUMENT PANEL SWITCHES

Accessory Switch

(Chevrolet)

The English/metric switch is located at the center of the instrument panel to the left of the AM/FM stereo and clock radio. The English/metric switch converts the speedometer's digital display to either miles or kilometers per hour. The switch also resets the digital trip odometer.

The instrument panel and interior lamp and multifunction switch (if equipped) is located to the right of the AM/FM stereo and clock radio. The top switch is a rear compartment lid release switch. The bottom switch turns off cluster illumination lamps.

(Wagon)

The accessory switch controls the operation of the rear wiper and washer. The switch will also unlock or lock the end gate and unlock the end gate window.

On vehicles equipped with power door locks, only the end gate window can be unlocked by the accessory switch.

Headlamp and Instrument Panel Lamp Dimmer Switch

The headlamp and instrument panel lamp dimmer switch has a headlamp switch and a dimmer control.

The headlamp switch controls headlamps, parking and sidemarker lamps, taillamps, interior lamps and instrument panel lamps. The dimmer control regulates the intensity of instrument panel illumination. For more information, refer to SECTION 8B.

The headlamp and instrument panel lamp dimmer switch may also contain a twilight sentinel switch and a headlamp switch indicator lamp, if the vehicle is equipped with a twilight sentinel option. For more information, refer to SECTION 9C.

Rear Compartment Lid Release Switch

(Chevrolet)

The optional rear compartment lid release switch is mounted to the instrument panel and can be accessed by opening the instrument panel compartment door.

For police and taxi vehicles, the lid release switch is mounted to the headlamp and instrument panel lamp dimmer switch or the accessory switch panel.

When the lid release switch is pressed, voltage is applied to the rear compartment lid release solenoid releasing the rear compartment lid latch.

(Buick)

The rear compartment lid release switch is located near the parking brake release lever. There is also a rear compartment lid release enable switch which can be accessed by unlocking and opening the instrument panel compartment door. The rear compartment lid release enable switch provides security by denying use of the rear compartment lid release switch unless the enable switch is on.

When the switch is off, current flow to the rear compartment lid release solenoid is interrupted, and the rear compartment lid release switch is disabled.

Rear Window Defogger Switch

The rear window defogger switch is part of the heater and air conditioning control and controls the rear window defogger and heated outside rearview mirrors, if equipped.

The heater and air conditioning control contains an internal timer to control the time the internal contacts are closed. When the ignition switch is turned to "RUN" and the rear window defogger switch is turned to "ON" for the first time, the defog cycle lasts 10 minutes (further operation will result in 5 minute defog cycles). The defog cycle is reset to 10 minutes when the ignition switch is turned to "OFF" and back to "RUN".

WARNING/INDICATOR LAMPS

Cluster Indicator Lamps

"DOOR OPEN" INDICATOR LAMP

The optional "Door Open" indicator lamp will flash when either rear side door is open but not if the door is ajar.

"GATE AJAR" INDICATOR LAMP (WAGON)

The "GATE AJAR" indicator lamp comes on to warn the driver when the end gate is not closed.

Voltage is applied through the fuse block to the indicator lamp and then to the gate ajar switch.

When the end gate is opened as a door, the gate ajar switch closes, providing a path to ground, and the indicator lamp comes on. Once the end gate is closed, the switch opens and the indicator lamp goes out.

FASTEN SAFETY BELTS INDICATOR LAMP

The fasten safety belts indicator lamp will always go on for 4 to 8 seconds whenever the ignition switch is in "RUN," "BULB TEST" or "START," when the driver's seat belt is buckled.

If the seat belt remains unbuckled, the fasten safety belt indicator lamp and audio alarm remain on indefinitely.

For more information, refer to "Warning/Audio Alarm" in this section or SECTION 10-11.

"HIGH BEAM" INDICATOR LAMP

Refer to SECTION 8B.

TURN SIGNAL INDICATOR LAMPS

The left or right turn indicator lamp will illuminate when the multifunction lever on the left side of the steering column is moved to signal a turn. The turn/hazard switch in the steering column receives an on-and-off flashing current from the fuse block and the turn signal flasher unit in the convenience center when the ignition switch is in the "RUN," "START" or "BULB TEST" position. The turn/hazard switch routes the current to circuits that feed the left or right front turn signal lamp, left or right rear tail/stop/turn

signal lamps when the multifunction lever is moved. The circuit to the left or right front turn signal lamp, and cornering and sidemarker lamps has a branch that feeds the appropriate turn indicator lamp in the instrument cluster, causing it to flash when the exterior lamps are indicating a turn.

When the hazard warning button on the right side of the steering column is pressed in, the left and right front turn signal lamps, cornering and sidemarker lamps and rear tail/stop/turn signal lamps all flash, and both turn signal indicator lamps in the instrument cluster flash. Power for the hazard warning system reaches the turn/hazard switch from the fuse block and the hazard flasher in the convenience center. Power is supplied with the ignition switch in any position. When the hazard warning system is flashing, the turn signal circuits are inoperative.

Cluster Warning Lamps

ABS WARNING LAMP

Refer to SECTION 5 and SECTION 5E1.

"BRAKE" WARNING LAMP

Refer to SECTION 8A.

"VOLTS" WARNING LAMP

Refer to SECTION 6D3.

"AIR BAG" WARNING LAMP

The "AIR BAG" warning lamp will light to warn the driver of a potential Supplemental Inflatable Restraint (SIR) system problem that could prevent the proper deployment of the air bags in an accident. When the ignition switch is first turned on, the lamp will flash seven times to verify proper operation of the lamp circuit and the Sensing and Diagnostic Module (SDM). The lamp also will flash SIR trouble codes to aid diagnosis when the designated Data Link Connector (DLC) is grounded with the ignition on. In addition, a Scan Tool can be used to read trouble codes remaining in the "history" memory of the SDM and to clear all "history" codes after repair. For additional information, including service precautions, refer to SECTION 9J.

"OIL" PRESSURE INDICATOR LAMP

(Buick)

The "OIL" pressure indicator lamp comes on to warn the driver when the engine oil pressure is low. Battery voltage is applied to one side of the bulb. A ground path is provided by the engine oil pressure switch, which closes when the oil pressure is below 28 kPa (4 psi). This tests the bulb when the ignition switch is turned on to start the engine. After the engine starts and normal oil pressure builds up, the engine oil pressure switch opens and the "OIL" pressure indicator lamp goes out.

8C-6 INSTRUMENT PANEL AND GAGES

"SERVICE ENGINE SOON" or "CHECK ENGINE" INDICATOR LAMP

The "SERVICE ENGINE SOON" or "CHECK ENGINE" indicator lamp in the instrument cluster will come on during engine starting to serve as a bulb and system check. It should go off after the engine starts unless a problem has been detected by the system.

The powertrain control module (PCM) performs a continual self-diagnosis of certain control functions and causes the "SERVICE ENGINE SOON" or "CHECK ENGINE" lamp to remain on when the engine is running if a problem is detected. The "SERVICE ENGINE SOON" or "CHECK" engine lamp may remain on for only ten seconds if the problem is an intermittent one. In any event, the PCM will store in memory a (4) digit diagnostic trouble code if a problem is detected. Refer to SECTION 6E3 for more information.

COOLANT "HOT" INDICATOR LAMP

(Buick)

The coolant "HOT" indicator lamp comes on to warn the driver of high coolant temperature.

With the ignition switch in "RUN," "BULB TEST" or "START," voltage from the fuse block is applied to the coolant "HOT" indicator lamp. In "BULB TEST" or "START," the lamp is grounded through the ignition switch so that the bulb can be tested. In "RUN," current through the bulb can be grounded through the coolant temperature switch. The switch closes when the coolant temperature exceeds 128°C (262°F) and the lamp glows.

"CHECK GAGE" WARNING LAMP

(Chevrolet)

The "CHECK GAGE" warning lamp will light to warn the driver to check the oil pressure gage, engine coolant temperature gage and the voltmeter.

When lit, the "CHECK GAGE" lamp indicates that one or more of these gages shows an abnormal operating range or condition.

"LOW COOLANT LEVEL" INDICATOR

A magnetic float in the coolant recovery reservoir rises and falls with the coolant level. A serviceable reed type switch (mounted in the bottom of the reservoir) senses the floating magnet. When the float (magnet) position gets low in the reservoir, the reed switch contacts are pulled together, switch grounds and the "LOW COOLANT LEVEL" lights. The "LOW COOLANT LEVEL" indicator does not light during bulb check when the ignition switch is initially turned "ON".

"LOW FUEL" INDICATOR

When the fuel level drops to approximately 1/8 of a tank, the instrument cluster will ground the "LOW FUEL" indicator, completing the circuit, thus illuminating the indicator.

"LOW OIL LEVEL" INDICATOR

The "LOW OIL" indicator ground is controlled by the PCM. To check for a low oil condition, the PCM checks the oil level sensor after the ignition switch has been turned to "OFF" or "LOCK" position.

The PCM checks for a low oil condition 32 minutes after the ignition switch is turned to "OFF" or "LOCK," if the previous ignition cycle was less than 12 minutes. If the previous ignition cycle was longer than 12 minutes, the PCM checks for a low oil condition 3 minutes after the ignition switch is turned to "OFF" or "LOCK."

When the PCM detects a low oil level condition, the PCM grounds the "LOW OIL LEVEL" indicator for the duration of the next ignition cycle.

"LOW WASHER FLUID" INDICATOR

The windshield washer solvent tank has a switch which closes when the washer solvent level becomes low. Voltage is applied to the "LOW WASHER FLUID" indicator. The switch provides ground, the circuit is completed and the indicator lights.

"PASS KEY" INDICATOR

Refer to SECTION 9D.

WARNING/AUDIO ALARM

The audio alarm module sounds a chime to bring attention to one or more of several conditions. These conditions are:

1. The lights are on and the ignition switch is not in "RUN," "BULB TEST," or "START".
2. The ignition key is in the ignition switch when the driver's door is open.
3. The seat belt is unbuckled when the ignition switch is in "RUN," "BULB TEST," or "START".
4. The turn signal has been on for more than a half mile. Voltage is applied at all times through the fuse block to power the solid state audio alarm module.

IGNITION KEY WARNING

Whenever the key is in the ignition switch and the driver's door is open, the module is grounded. This sounds the alarm.

FASTEN SEAT BELT WARNING

With the ignition switch in "RUN," "BULB TEST," or "START," voltage is applied through the fuse block to the audio alarm module. With the driver's seat belt unbuckled, the module is grounded through the seat belt switch. The "FASTEN SEAT BELTS" indicator always goes on for 4 to 8 seconds when seat belts are buckled, but remains on when the seat belts are not buckled. The fasten seat belts alarm, however, only sounds if the seat belt is unbuckled and the ignition switch is in "RUN," "BULB TEST" or "START."

LIGHTS-ON WARNING

When the headlamp switch is in "HEAD" or "PARK" position, voltage is applied to the audio alarm module. When the ignition switch is in "RUN," "BULB TEST" or "START," voltage is applied through the fuse block to the module. These two voltages are sensed and the alarm is not sounded.

When the ignition switch is not in "RUN," "BULB TEST" or "START," the module loses voltage. The audio alarm module senses the change. If voltage is still available, it is applied to sound the alarm. The alarm can be turned off by turning the headlamp switch to "OFF". The module no longer senses voltage from the headlamp switch, so the alarm does not sound.

DIAGNOSIS

For diagnosis of instrument panel, cluster electrical systems, including individual wire color information, and applicable precautions for testing solid state electronic devices and systems, refer to SECTION 8A.

ON-VEHICLE SERVICE

It may be necessary to color coat some replacement components before installing them in the vehicle. For information regarding this procedure, refer to SECTION 10-1.

SERVICE PRECAUTIONS

CAUTION: When performing service on or around SIR components or SIR wiring, follow the procedures listed below to temporarily disable the SIR system. Failure to follow procedures could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

The Sensing and Diagnostic Module (SDM) can maintain sufficient voltage to cause a deployment for up to ten seconds after the ignition switch is turned to "OFF" or the storage battery is disconnected. Many of the service procedures require disconnection of the "AIR BAG" fuse and the inflator module circuits from the deployment loops to avoid an accidental deployment.

DISABLING THE SIR SYSTEM**Remove or Disconnect**

1. Turn steering wheel so vehicle's tire and wheels are pointing straight ahead.
2. Turn ignition switch to "LOCK" and remove key.
3. "AIR BAG" fuse from instrument panel fuse block.
4. Left hand instrument panel sound insulator, if "Buick".

5. Connector Position Assurance (CPA) and both yellow two-way SIR harness connectors near base of steering column.

**Important**

- With the "AIR BAG" fuse removed and ignition switch in "RUN," the "AIR BAG" warning lamp will be lit. This is normal operation and does not indicate an SIR system malfunction.

ENABLING THE SIR SYSTEM**Install or Connect**

1. Turn ignition switch to "LOCK" and remove key.
2. Both yellow two-way SIR harness connectors near base of steering column and corresponding Connector Position Assurance (CPA).
3. "AIR BAG" fuse to instrument panel fuse block.
4. Left hand instrument panel sound insulator, if "Buick".
5. Turn ignition switch to "RUN" and verify that "AIR BAG" warning lamp flashes seven times and then turns off. If warning lamp does not work as described, refer to SECTION 9J.

NOTICE: The instrument panel and cluster contain Electrostatic Discharge (ESD) sensitive parts. When handling an electronic part that is identified as being ESD sensitive, the service technician should follow the guidelines in SECTION 0A. Following these guidelines will reduce any possible electrostatic charge buildup on the service technician's body and the electronic part.

HANDLING ELECTROSTATIC DISCHARGE (ESD) SENSITIVE PARTS

NOTICE: When handling an electronic part that has an ESD-sensitive sticker, refer to SECTION 0A. Follow these guidelines to reduce any possible build-up of electrostatic charge:

- Do not open the package until time to install the part.
- Avoid touching electrical terminals of the part.
- Before removing the part from its package, ground the package to a known good ground on the vehicle.
- Always touch a known good ground before handling the part. This should be repeated while handling the part. Do it more often after sliding across the seat, sitting down from a standing position, or walking a distance.

8C-8 INSTRUMENT PANEL AND GAGES

Not all parts that can be damaged by ESD have an ESD label. Components that can be damaged by ESD are:

- AM/FM stereo and clock radio
- Antilock brake system EBCM
- Automatic day/night mirror
- Heater and air conditioning control
- Instrument cluster
- Sensing and diagnostic module (SDM)
- Supplemental inflatable restraint (SIR)
- Twilight sentinel module
- Warning/indicator, audio alarm (chime module)

FRONT FLOOR CONSOLE

Figure 1

Remove or Disconnect

1. Retainer (2) from knob (1).
 - Pry out retainer.
2. Knob (1).

3. Trim plate (3)

- A. Place gear selector in "Neutral" with parking brake on.
- B. Unseat clips on forward edge of trim plate (3).
- C. Lift forward edge and unseat rear tabs.
- D. Disconnect shift indicator bulb.

4. Bolts/screws (4).

- Lift liner to expose forward bolts/screws.

5. Console (5).

Install or Connect

NOTICE: Refer to "NOTICE" on page 8C-1 of this section.

1. Console (5).

Tighten

- Bolts/screws (6) to 6 N.m (53 lb. in.).
2. Reinsert liner to cover bolts/screws (4).
 3. Trim plate (3).

Figure 1 - Front Floor Console

- A. Place gear selector in "Neutral" with parking brake on.
- B. Shift indicator bulb.
- C. Align rear tabs, shifter plate.
- D. Seat front tabs, shifter plate.
4. Knob (1).
5. Retainer (2) to knob (1).

INSTRUMENT PANEL - COMPARTMENTS

Ashtray and Cigarette Lighter

Figure 2

Remove or Disconnect

1. Four bolts/screws (3) attaching ashtray (1) to instrument panel.
 - Pull ashtray (1) out to expose bolts/screws (3).
2. Ashtray (1) from instrument panel.
3. Ashtray lamp connector from ashtray (1).
 - Replace bulb, if required.
4. Lighter connector from ashtray (1).
5. Lighter (2) from ashtray (1).

Install or Connect

NOTICE: Refer to "NOTICE" on page 8C-1 of this section.

1. Lighter (2) to ashtray (1).
2. Lighter connector to ashtray (1).
3. Ashtray lamp connector to ashtray (1).
4. Ashtray (1) to instrument panel.
5. Four bolts/screws (3) attaching ashtray (1) to instrument panel.

Tighten

- Bolts/screws (3) to 1.9 N-m (17 lb. in.).

Instrument Panel Compartment

The instrument panel compartment and door is serviced as an assembly. The lock and lamp are also serviceable. The lamp switch is part of the body wiring harness. Refer to SECTION 8B to service the lamp.

Instrument Panel Compartment Door

Figure 3

Remove or Disconnect

1. Three bolts/screws (7) attaching hinge to instrument panel.
2. Open instrument panel compartment door (6).
3. Instrument panel compartment door (6) from instrument panel.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Align instrument panel compartment door (6) to instrument panel.
2. Close instrument panel compartment door (6).
3. Three bolts/screws (7) attaching hinge to instrument panel.

Tighten

- Bolts/screws (7) to 1.9 N-m (17 lb. in.).

Figure 2 - Ashtray and Cigarette Lighter - (Typical)

8C-10 INSTRUMENT PANEL AND GAGES

Instrument Panel Compartment Door Latch and Lock Cylinder

Figure 3

↔ Remove or Disconnect

1. Open compartment door.
2. Bolts/screws (8) from door latch.
3. Lock cylinder (5) from door latch.
 - A. Turn lock cylinder (5) to lock position and remove key.
 - B. Place latch in lock position.
 - C. Using awl or paper clip, depress tumbler slightly through hole at base of cylinder housing.
 - D. Insert key and turn to unlock position.
 - E. Lift door latch handle and remove lock cylinder (5).

→→ Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Lock cylinder (5).
 - A. Place latch in lock position.
 - B. Insert key and lock cylinder (5) into latch.
 - C. Lift door latch handle.
 - D. Turn key to unlock position and remove.
2. Bolts/screws (8) attaching latch to instrument panel compartment door (6).

⌚ Tighten

- Bolts/screws (8) to 1.9 N·m (17 lb. in.).

INSTRUMENT PANEL - TRIM PLATES AND PANELS

Instrument Panel Cluster Trim Plate

(Chevrolet)

Figure 4

↔ Remove or Disconnect

1. Bolts/screws (11) attaching instrument panel cluster trim plate (10) to upper trim pad.
2. Unsnap instrument panel cluster trim plate (10) from instrument panel lower trim plate.

→→ Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Align locating features of cluster trim plate (10) with lower trim plate.
2. Snap cluster trim plate (10) to lower trim plate.

Figure 3 - Instrument Panel Compartment - (Typical)

3. Bolts/screws (11) through cluster trim plate (10) into upper trim pad.

⌚ Tighten

- Bolts/screws (11) to 1.9 N·m (17 lb. in.).

Instrument Panel Nameplates

Figure 5

Use a small screwdriver to gently pry out nameplates from instrument panel trim plate. Replacement nameplates can be snapped into place on the trim plate.

Instrument Panel Upper Trim Pad

Figures 6 and 7

When servicing the upper trim pad, do not attempt to open the passenger SIR cover. If air bag has been deployed, do not attempt to reseal cover. Upper trim pad must be replaced.

→→ Install or Connect

1. Disable the SIR. Refer to "Disabling the SIR System" in this section.
2. If Chevrolet, instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

Figure 4 - Instrument Panel Cluster Trim Plate - (Chevrolet)

3. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
4. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.
5. Side window defogger grilles (15 or 25), if necessary.
6. Bolts/screws (19 or 26) securing upper trim pad (16 or 22) to instrument panel.
7. Carefully lift upper trim pad (16 or 22) up and away from dash panel and disengage clips.

NOTICE: For Chevrolet, when removing upper trim pad, ensure that left-hand side window defroster duct, mounted underneath upper trim pad, does not catch on bolt/screw which secures upper left corner of instrument panel carrier to hinge pillar tie bar. Minor damage to defroster duct may result if it is forced against this bolt/screw. In the event of this occurrence, do not attempt to service defroster duct as it will continue to function easily within specification.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Align and engage upper trim pad clips to dash panel.
2. Seat upper trim pad (16 or 22) using locating features on instrument panel.
 - Ensure that ambient light and sunload temperature sensors are accessible through defroster nozzle grille opening.
3. Bolts/screws (19 or 26) securing upper trim pad (16 or 22) to instrument panel.

Tighten

- Bolts/screws (19 or 26) to 1.9 N·m (17 lb. in.).
4. Side window defogger grilles (15 or 25), if removed.
 5. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.

Figure 5 - Instrument Panel Nameplates

Figure 6 - Upper Trim Pad, Lower and Right-Hand Trim Plates - (Chevrolet)

6. If Chevrolet, instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
7. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
8. Enable SIR. Refer to "Enabling the SIR System" in this section.

Instrument Panel Lower Trim Plate

(Chevrolet)

Figure 6

Remove or Disconnect

1. Instrument panel cluster trim plate. Refer to "Instrument Panel Cluster Trim Plate" in this section.
2. Ashtray, if replacing trim plate (17). Refer to "Ashtray and Cigarette Lighter" in this section.
3. Bolts/screws (20) attaching bottom of instrument panel lower trim plate (17) to instrument panel.
4. Unsnap instrument panel lower trim plate (17) from instrument panel.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Align instrument panel lower trim plate (17) with locator pins on instrument panel.
2. Snap instrument panel lower trim plate (17) into instrument panel.
3. Bolts/screws (20) attaching bottom of lower trim plate to instrument panel.

Tighten

- Bolts/screws (20) to 1.9 N.m (17 lb. in.).
4. Ashtray, if removed. Refer to "Ashtray and Cigarette Lighter" in this section.
 5. Instrument panel cluster trim plate. Refer to "Instrument Panel Cluster Trim Plate" in this section.

Instrument Panel Trim Plate

(Buick)

Figure 7

Remove or Disconnect

1. Bolts/screws (27) attaching trim plate (23) to upper trim pad (22).
2. Unsnap clips on trim plate (23) from instrument panel.
3. Trim plate (23).

Figure 7 - Upper Trim Pad, Lower and Right-Hand Trim Plates - (Buick)

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Align locator pins and clips on trim plate (23) to instrument panel.
 - Press firmly to fully engage clips.
2. Bolts/screws (27) attaching trim plate (23) to upper trim pad (22).

Tighten

- Bolts/screws (27) to 1.9 N.m (17 lb. in.).

Instrument Panel Right-Hand Trim Plate

Figures 6 and 7

Remove or Disconnect

1. Open instrument panel compartment door.
2. Unsnap clips on trim plate (18 or 24).
3. Trim plate (18 or 24).

Install or Connect

1. Align clips on trim plate (18 or 24) to instrument panel.
 - Press firmly to fully engage clips.
2. Close instrument panel compartment door.

Instrument Panel Steering Column Opening Filler

(Chevrolet)

Figure 8

Remove or Disconnect

1. Bolts/screws (32) attaching steering column opening filler (30) to lower trim plate (17).
2. Steering column opening filler (30).
 - Lower steering column opening filler (30) so that tabs on filler (30) clear lower trim plate (17).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Steering column opening filler (30) to instrument panel lower trim plate (17) by inserting tabs into place on lower trim plate (17).
2. Bottom of steering column opening filler (30) to base of lower trim plate (17) using locator pins.
3. Bolts/screws (32) attaching steering column opening filler (30) to lower trim plate (17).

Tighten

- Bolts/screws (32) to 1.9 N.m (17 lb. in.).

8C-14 INSTRUMENT PANEL AND GAGES

Figure 8 - Instrument Panel Steering Column Opening Filler - (Chevrolet)

(Buick)

Figure 9

Remove or Disconnect

1. Unsnap clips on steering column opening filler (35) from instrument panel.

Install or Connect

1. Align locator clip on steering column opening (35) to instrument panel.
2. Snap clips on steering column opening filler (35) to instrument panel.

WINDSHIELD DEFROSTER NOZZLE GRILLE

Figure 10

Remove or Disconnect

1. Unsnap grille (36) from upper trim pad.
2. Sunload temperature sensor (38) from grille (36), if equipped.
3. Headlamp automatic control ambient light sensor (39), if equipped.

Install or Connect

1. Headlamp automatic control ambient light sensor (39), if removed.

Figure 9 - Instrument Panel Steering Column Opening Filler - (Buick)

2. Sunload temperature sensor (38) to grille (36), if removed.
3. Snap grille (36) into place on upper trim pad.

INSTRUMENT PANEL DRIVER KNEE BOLSTER AND DEFLECTOR

Figure 11

Remove or Disconnect

1. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
2. Four bolts/screws (42) attaching bolster (40) to deflector (41).
3. Bolster (40).
4. Four bolts/screws (43) attaching deflector (41) to tie bar.
5. Deflector (41).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Deflector (41).
2. Four bolts/screws (43) attaching deflector (41) to tie bar.

Figure 10 - Windshield Defroster Nozzle Grille - (Typical)

 Tighten

- Bolts/screws (43) to 10 N.m (89 lb. in.).
- 3. Align bolster (40) to deflector (41).
- 4. Four bolts/screws (42).

 Tighten

- Bolts/screws (42) to 10 N.m (89 lb. in.).

5. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.

INSTRUMENT PANEL INSULATOR (RIGHT SIDE)

(Chevrolet and Buick)

Figure 12

 Remove or Disconnect

1. Unsnap clips on insulator (46) from bottom of instrument panel and pull rearward.
2. Insulator (46).

 Install or Connect

1. Align locator on insulator (46) with hole in cowl.
2. Align slot in insulator (46) with stud on instrument panel lower brace.
3. Snap clips on insulator (46) to instrument panel.

- A SLOT
B TAB
C TIE BAR
40 BOLSTER, INSTRUMENT PANEL DRIVER KNEE
41 DEFLECTOR, INSTRUMENT PANEL DRIVER KNEE BOLSTER

8C-16 INSTRUMENT PANEL AND GAGES

INSTRUMENT PANEL INSULATOR (LEFT SIDE)

(Buick)

Figure 12

↔ Remove or Disconnect

1. Wing-nut on accelerator pedal.
2. Unsnap three clips on insulator and pull down.

→ Install or Connect

1. Align insulator hole with Stud on accelerator pedal.
2. Attach wing nut.
3. Insert three molding clips into slots in I/P and snap in place.

INSTRUMENT PANEL - CONTROLS, GAGES AND SWITCHES

AM/FM Stereo and Clock Radio

(Chevrolet)

Figure 13

↔ Remove or Disconnect

1. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

2. Bolts/screws (49) attaching radio (48) to instrument panel.
3. Radio (48) slowly from instrument panel.
4. Instrument panel harness connector and antenna cable from radio (48).

→ Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel harness connector and antenna cable to radio (48).
2. Align locator pins on instrument panel with holes on radio bracket.
3. Bolts/screws (49) attaching radio (48) to instrument panel.

⌚ Tighten

- Bolts/screws (49) to 1.9 N.m (17 lb. in.).
4. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

Figure 12 - Instrument Panel Insulators

Figure 13 - AM/FM Stereo and Clock Radio - (Chevrolet)

(Buick)

Figure 14

Remove or Disconnect

1. Instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
2. Bolts/screws (54) attaching radio brackets (50) to instrument panel.
3. Radio (52) slowly from instrument panel.
4. Instrument panel harness connector and antenna cable from radio (52).
5. Radio nuts (56) and left and right-hand radio brackets (50) from radio (52).
6. Bolts/screws (53) from left and right sides of radio (52), if necessary.
7. Bolt/screw (53) with retainer (57) attached from rear of radio (52), if necessary.
8. Bolt/screw (55) attaching radio rear bracket (51) to instrument panel, if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Bolts/screws (55) attaching radio rear bracket (51) to instrument panel, if removed.

Tighten

- Bolts/screws (55) to 1.9 N·m (17 lb. in.).

2. Bolts/screws (53) with retainer (57) attached to rear of radio (52).

Tighten

- Bolts/screws (53) to 1.9 N·m (17 lb. in.).

3. Bolt/screw (53) to left side of radio (52). Repeat on right side.

Tighten

- Bolts/screws (53) to 1.9 N·m (17 lb. in.).

4. Left and right-hand brackets (50) to radio (52) with nuts (56).

Tighten

- Nuts (56) to 2.8 N·m (25 lb. in.).

5. Instrument panel harness connector and antenna cable to radio (40).

6. Radio (52).

A. Align retainer (51) at rear of radio (52) with hole in radio rear bracket (51).

B. Align locator pins on instrument panel with holes in left and right-hand radio brackets (50).

7. Bolts/screws (54) attaching radio brackets (50) to instrument panel.

Figure 14 - AM/FM Stereo and Clock Radio - (Buick)

Tighten

- Bolts/screws (54) to 1.9 N.m (17 lb. in.).

8. Instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

INSTRUMENT CLUSTER

Figure 15

Remove or Disconnect

1. If Chevrolet, instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
2. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
3. Four bolts/screws (61) attaching cluster (60) to instrument panel.
4. Unclip shift indicator cable from steering column.
5. Gently pull cluster (60) from instrument panel harness connectors.
6. Instrument cluster lamp bulbs (62) when necessary.

1. Replace instrument cluster lamp bulbs when necessary.

- PC 161 (except cluster illumination)
- PC 194 (cluster illumination)

2. Cluster (60) to instrument panel.

- Align cluster (60) with instrument panel harness connectors and seat firmly.

3. Shift indicator cable.

Adjust

- Shift indicator cable. Refer to SECTION 3F.

4. Four bolts/screws (61) attaching cluster assembly (60) to instrument panel.

Tighten

- Bolts/screws (61) to 1.9 N.m (17 lb. in.).

5. If Chevrolet, instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

6. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.

Figure 15 - Instrument Cluster and Instrument Cluster Lamps - (Typical)

ODOMETER REPAIR NOTICE LABEL**Figure 16****! Important**

- When replacing an instrument cluster, the law requires the odometer reading of the replacement unit to be set to register the same mileage as the prior odometer. If the same mileage cannot be set, the law requires that the replacement odometer be set to zero and a label be installed on the driver's door frame to show the previous reading and the date of replacement.
- A copy of the label must be retained in compliance with the retention requirements specified in the "Guidelines for General Motors Odometer Policy."

↔ Install or Connect

1. Clean area around the left B-pillar where label is to be attached.
 - Label area is to be clean and free from plastisol or any foreign material that could affect adhesion of label.
2. Properly fill out all necessary information on label.
 - Sign and date label.
3. Remove backing and attach label to left B-pillar.

ACCESSORY SWITCH PANEL

(Chevrolet)

Figure 17**↔ Remove or Disconnect**

1. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
2. Unsnap switches (65 and 66) from housing on instrument panel.
3. Cigarette lighter and housing, if equipped.
4. Instrument panel harness connectors.

↔ Install or Connect

1. Instrument panel harness connectors.
2. Align switches (65 and 66) with appropriate housing on instrument panel using locators.
3. Snap switches (65 and 66) in place.
4. Cigarette lighter and housing, if equipped.
5. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

8C-20 INSTRUMENT PANEL AND GAGES

Figure 17 - Accessory Switch Panel - (Chevrolet)

Figure 18 - Accessory Switch Panel - (Buick Wagon)

(Chevrolet Wagon)

Refer to "Headlamp, Instrument Panel Lamp and Accessory Switch Panel and Compartment" in this section.

(Buick Wagon)

Figure 18

Remove or Disconnect

1. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
2. Bolt/screw (69) attaching switch (68) to instrument panel.
3. Switch (68) from instrument panel.
4. Instrument panel harness connector from switch (68).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel harness connector to switch (68).
2. Switch (68) to instrument panel.
3. Bolt/screw (69) attaching switch (68) to instrument panel.

Tighten

- Bolt/screw (69) to 1.9 N.m (17 lb. in.).
4. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.

Headlamp, Instrument Panel Lamp and Accessory Switch Panel and Compartment

(Chevrolet)

Figure 19

Remove or Disconnect

1. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
2. Bolt/screw (74) attaching headlamp switch panel (71) to instrument panel.
3. Unsnap headlamp switch panel (71) from instrument panel.
4. Headlamp connector, dimmer connector and twilight sentinel connector, if equipped.
5. Wagon switches and accessory switch panel (72) from behind headlamp switch panel (71), if equipped.
6. Instrument panel compartment (70) from behind headlamp switch panel (71), if equipped.
7. Instrument panel harness connector from rear compartment lid release switch (73), if equipped.

- Unsnap switch (73) from behind housing.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel harness connector to rear compartment lid release switch (73), if removed.
2. Instrument panel compartment (70) to headlamp switch (71), if removed.

Figure 19 - Headlamp, Instrument Panel Lamp and Accessory Switch Panel and Compartment - (Chevrolet)

3. Wagon switches to accessory switch panel (72), if removed.
4. Headlamp connector, dimmer connector and twilight sentinel connector, if removed.
5. Align locator pin on instrument panel with hole in bottom of headlamp switch (71).
6. Snap clips on switch (71) to slots on instrument panel.
7. Bolt/screw (74) securing headlamp switch (71) to instrument panel.
4. Bolt/screw (81) attaching switch housing (78) to instrument panel.

Tighten

- Bolt/screw (74) to 1.9 N.m (17 lb. in.).

8. Instrument panel lower trim plate including instrument panel cluster trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.

(Buick)

Figure 20

Remove or Disconnect

1. Fuse block access door.
2. Instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
3. Headlamp switch knob (79) with shaft from switch (80).
 - To release shaft, press button on top of switch (80) firmly and remove shaft.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel harness connector to switch (80).
2. Align switch (80) with hole in instrument panel.
3. Screw in headlamp switch bezel (77).
4. Lamp connector and twilight sentinel connector, if equipped.
5. Align clips on switch housing (78) to instrument panel and snap into place.
6. Bolt/screw (81) attaching switch housing (78) to instrument panel.

Tighten

- Bolt/screw (81) to 1.9 N.m (17 lb. in.).

Figure 20 - Headlamp and Instrument Panel Lamp Dimmer Switch - (Buick)

7. Insert headlamp switch knob (79) with shaft into switch (80) and snap in place.
8. Instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
9. Fuse block access door.

Instrument Panel Lamp Dimmer

(Chevrolet)

Figure 21

Remove or Disconnect

1. Instrument panel harness connector (not shown).
2. Bolts/screws (84) attaching lamp dimmer (83) to instrument panel lower reinforcement.
3. Lamp dimmer (83).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Lamp dimmer (83) to instrument panel lower reinforcement.
2. Bolts/screws (84).

Figure 21 - Instrument Panel Lamp Dimmer - (Chevrolet)

Tighten

- Bolts/screws (84) to 1.9 N.m (17 lb. in.).
- 3. Instrument panel harness connector (not shown) to lamp dimmer (83).

8C-24 INSTRUMENT PANEL AND GAGES

REAR COMPARTMENT LID RELEASE SWITCH

(Chevrolet Sedan)

Figure 22

↔ Remove or Disconnect

1. Rear compartment lid release switch (85).
 - Reach behind switch (85), squeeze tabs and push forward.
2. Instrument panel harness connector from switch (85).

↔ Install or Connect

1. Instrument panel harness connector from switch (85).
2. Align rear compartment lid release switch (85) to hole in instrument panel and snap into place.

(Chevrolet Police and Taxi Vehicles)

Refer to "Headlamp, Instrument Panel Lamp and Accessory Switch Panel and Compartment" in this section.

(Buick Sedan)

Figure 23

↔ Remove or Disconnect

1. Steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.

Figure 22 - Rear Compartment Lid Release Switch - (Chevrolet Sedan)

2. Bolt/screw (89) attaching switch bezel (86) to instrument panel.
3. Unsnap top of switch bezel (86) from instrument panel.
4. Instrument panel harness connector from switch (88).
5. Lamp (87) from switch bezel (86).
6. Unsnap switch (88) from switch bezel (86).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Snap switch (88) into switch bezel (86).
2. Lamp (87) to switch bezel (86).
3. Instrument panel harness connector to switch (88).
4. Align switch bezel (86) and snap top into place on instrument panel.
5. Bolt/screw (89) attaching switch bezel (86) to instrument panel.

⌚ Tighten

- Bolt/screw (89) to 1.9 N-m (17 lb. in.).
6. Steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.

Figure 23 - Rear Compartment Lid Release Switch - (Buick Sedan)

Rear Compartment Lid Release Enable Switch

(Buick Sedan)

Figure 24

Remove or Disconnect

1. Open instrument panel compartment door (6).
2. Rear compartment lid release enable switch (91).
 - Use screwdriver to compress tabs on sides of switch (91) and slide forward.
3. Instrument panel harness connector from switch (91).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel harness connector to switch (91).
2. Snap rear compartment lid release enable switch (91) into place on instrument panel.

INSTRUMENT PANEL CARRIER

For Chevrolet, the instrument panel carrier attaches to the hinge pillar tie bar. The hinge pillar tie bar provides rigid support for the instrument panel and passenger inflator module. The air distributor is also attached to the hinge pillar tie bar.

For Buick, the instrument panel carrier attaches to the air distributor which, in turn, provides rigid support for the instrument panel and passenger inflator module. The air distributor attaches to the hinge pillars through the use of brackets which are an integral part of the air distributor.

If it is only necessary to disconnect the instrument panel carrier from the air distributor without removing all the components, refer to "Instrument Panel Carrier Disconnect" procedure immediately following "Instrument Panel Carrier Replacement."

Instrument Panel Carrier Replacement

Figures 25 and 26

Important

- When installing a new instrument panel carrier, do not remove the support rib located in the steering column opening until after it is attached to the hinge pillar tie bar for Chevrolet or the air distributor for Buick. The support rib will provide stability and facilitate alignment of locator pins.

Figure 24 - Rear Compartment Lid Release Enable Switch - (Buick Sedan)

Remove or Disconnect

CAUTION: Refer to "Caution" on page 8C-1 of this section.

1. Disable SIR. Refer to "Disabling the SIR System" in this section.
2. Ashtray and cigarette lighter. Refer to "Ashtray and Cigarette Lighter" in this section.
3. Instrument panel compartment door. Refer to "Instrument Panel Compartment Door" in this section.
4. Instrument panel cluster trim plate, if Chevrolet. Refer to "Instrument Panel Cluster Trim Plate" in this section.
5. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.
6. If Chevrolet, instrument panel lower trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
7. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
8. Instrument panel upper trim pad. Refer to "Instrument Panel Upper Trim Pad" in this section.
9. Instrument panel right-hand trim plate. Refer to "Instrument Panel Right-Hand Trim Plate" in this section.
10. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
11. Instrument panel driver side knee bolster and deflector. Refer to "Instrument Panel Driver Knee Bolster and Deflector" in this section.

Figure 25 - Instrument Panel Carrier - (Chevrolet)

NOTICE: Remove stoplamp switch before fully lowering the steering column. Failure to do so may cause the stoplamp switch to become damaged or thrown out of adjustment resulting in a malfunctioning stoplamp switch or premature brake wear.

12. Stoplamp switch. Refer to SECTION 5.
13. Instrument panel sound insulator panel. Refer to "Instrument Panel Sound Insulator Panel" in this section.
14. AM/FM stereo and clock radio. Refer to "AM/FM Stereo and Clock Radio" under "On-Vehicle Service" in this section.
15. Instrument cluster. Refer to "Instrument Cluster" under "On-Vehicle Service" in this section.
16. Accessory switch panels. Refer to "Accessory Switch Panel" in this section.
17. Headlamp, instrument panel lamp and accessory switch panel and compartment. Refer to "Headlamp, Instrument Panel Lamp and Accessory Switch Panel and Compartment" in this section.
18. Instrument panel lamp dimmer. Refer to "Instrument Panel Lamp Dimmer" in this section.
19. Rear compartment lid release switch. Refer to "Rear Compartment Lid Release Switch" under "On-Vehicle Service" in this section.
20. Rear compartment lid release enable switch, if Buick. Refer to "Rear Compartment Lid Release Enable Switch" in this section.

21. Engine oil change reset switch. Refer to "Engine Oil Change Reset Switch" under "On-Vehicle Service" in this section.
22. Passenger SIR inflator module. Refer to SECTION 9J.
23. Inside air temperature sensor, if equipped. Refer to SECTION 1C.
24. Parking brake release handle. Refer to SECTION 5F.
25. Completely lower steering column. Refer to SECTION 3F.
26. Fifty-six way, ten way and eight way instrument panel harness connectors located just right of the steering column.
27. Temperature valve electric actuator and vacuum solenoid valve electrical connectors for Buick, temperature control cable at module for Chevrolet.
28. Instrument panel harness and antenna cable connectors at right hinge pillar.
29. Bolts/screws (96) and nut (97) attaching instrument panel lower brace (93) to carrier and dash panel.
30. Instrument panel lower brace (93).
31. Instrument panel carrier (94 or 100).
 - If Chevrolet, remove bolts/screws (95) attaching carrier (94) to hinge pillar tie bar (92).
 - If Buick, remove bolts/screws (101) and bolts/screws (103) attaching carrier (100) to air distributor (102).

Figure 26 - Instrument Panel Carrier - (Buick)

32. Instrument panel wiring harness from instrument panel. Refer to "Instrument Panel Wiring Harness" in this section.

- Note instrument panel wiring harness routing before removal.

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

- Instrument panel wiring harness to carrier (94 or 100). Refer to "Instrument Panel Wiring Harness" in this section.
- Instrument panel carrier (94 or 100).
 - If Chevrolet:
 - Align and engage four locator pins on carrier (94) to slots on hinge pillar tie bar (92).
 - Bolts/screws (95) attaching carrier to hinge pillar tie bar (92).
 - Bolt/screw (95) through lower reinforcement bracket (98) to right-hand hinge pillar.

Tighten

- Bolts/screws (95) to 10 N.m (89 lb. in.).
- If Buick:
 - Align and engage carrier to locator pins on air distributor.
 - Bolts/screws (101) attaching upper area of carrier to air distributor (102).

Tighten

- Bolts/screws (101) to 10 N.m (89 lb. in.).
- C. Bolts/screws (103) to secure lower area of instrument panel carrier (100).

Tighten

- Bolts/screws (103) to 1.9 N.m (17 lb. in.).
- Instrument panel lower brace (93).
 - Nut (97) attaching lower brace (93) to cowl.

Tighten

- Nut (97) to 10 N.m (89 lb. in.).
- Bolt/screw (96) attaching lower brace (93) to carrier (94 or 100).

Tighten

- Bolt/screw (96) to 10 N.m (89 lb. in.).
- Instrument panel harness and antenna cable connectors at right hinge pillar.
 - Temperature valve electric actuator and vacuum solenoid valve electrical connectors for Buick, temperature control cable at module for Chevrolet.
 - Fifty-six way, ten way and eight way instrument panel harness connectors located just right of the steering column.
 - Raise steering column. Refer to SECTION 3F.
 - Parking brake release handle. Refer to SECTION 5F.

8C-28 INSTRUMENT PANEL AND GAGES

11. Inside air temperature sensor, if removed. Refer to SECTION 1C.
12. Passenger SIR inflator module. Refer to SECTION 9J.
13. Engine oil change reset switch. Refer to "Engine Oil Change Reset Switch" under "On-Vehicle Service" in this section.
14. Rear compartment lid release switch. Refer to "Rear Compartment Lid Release Switch" under "On-Vehicle Service" in this section.
15. Rear compartment lid release enable switch, if Buick. Refer to "Rear Compartment Lid Release Enable Switch" in this section.
16. Instrument panel lamp dimmer. Refer to "Instrument Panel Lamp Dimmer" in this section.
17. Headlamp, instrument panel lamp and accessory switch panel and compartment. Refer to "Headlamp, Instrument Panel Lamp and Accessory Switch Panel" in this section.
18. Instrument cluster. Refer to "Instrument Cluster" under "On-Vehicle Service" in this section.
19. Accessory switch panel. Refer to "Accessory Switch Panel" in this section.
20. AM/FM stereo and clock radio. Refer to "AM/FM Stereo and Clock Radio" under "On-Vehicle Service" in this section.
21. Instrument panel sound insulator panel. Refer to "Instrument Panel Sound Insulator Panel" in this section.
22. Stoplamp switch. Refer to SECTION 5.
23. Instrument panel driver knee bolster and deflector. Refer to "Instrument Panel Driver Knee Bolster and Deflector" in this section.
24. Instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
25. Instrument panel right-hand trim plate. Refer to "Instrument Panel Right-Hand Trim Plate" in this section.
26. Instrument panel upper trim pad. Refer to "Instrument Panel Upper Trim Pad" in this section.
27. If Chevrolet, instrument panel lower trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section. 28 If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
28. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.
29. Instrument panel cluster trim plate, if Chevrolet. Refer to "Instrument Panel Cluster Trim Plate" in this section.
30. Instrument panel compartment door. Refer to "Instrument Panel Compartment Door" in this section.
31. Ashtray and cigarette lighter. Refer to "Ashtray and Cigarette Lighter" in this section.
32. Enable SIR. Refer to "Enabling the SIR System" in this section.

Instrument Panel Carrier Disconnect

Figures 25 and 26

Refer to the following procedure to disconnect and reconnect the carrier for other than carrier replacement. This procedure may be used when removal of all components on the instrument panel is not necessary, i.e.; heater and air conditioning module replacement.

Remove or Disconnect

CAUTION: Refer to "Caution" on page 8C-1 of this section.

1. Disable SIR. Refer to "Disabling the SIR System" in this section.
2. Instrument panel cluster trim plate, if Chevrolet. Refer to "Instrument Panel Cluster Trim Plate" in this section.
3. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.
4. If Chevrolet, instrument panel lower trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
5. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
6. Instrument panel right-hand trim plate. Refer to "Instrument Panel Right-Hand Trim Plate" in this section.
7. If Buick, instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
8. Instrument panel upper trim pad. Refer to "Instrument Panel Upper Trim Pad" in this section.
9. Instrument panel driver knee bolster and deflector. Refer to "Instrument Panel Driver Knee Bolster and Deflector" in this section.

NOTICE: Remove stoplamp switch before fully lowering the steering column. Failure to do so may cause the stoplamp switch to become damaged or thrown out of adjustment resulting in a malfunctioning stoplamp switch or premature brake wear.

10. Stoplamp switch. Refer to SECTION 5.
11. Instrument panel sound insulator panel. Refer to "Instrument Panel Sound Insulator Panel" in this section.
12. Passenger inflator module. Refer to SECTION 9J.
13. Inside air temperature sensor. Refer to SECTION 1C.
14. Parking brake release handle. Refer to SECTION 5F.
15. Completely lower steering column. Refer to SECTION 3F.

16. Fifty-six way, ten way and eight way instrument panel harness connectors located just right of the steering column.
17. Temperature valve electric actuator and vacuum solenoid valve electrical connectors for Buick, or temperature control cable at module for Chevrolet.
18. Instrument panel harness and antenna cable connectors at right hinge pillar.
19. Bolts/screws (96) and nut (97) attaching instrument panel lower brace (93) to carrier and dash panel.
20. Instrument panel lower brace (93).
21. Instrument panel carrier (94 or 100).
 - If Chevrolet, remove bolts/screws (95) attaching carrier (94) to hinge pillar tie bar (92).
 - If Buick, remove bolts/screws (101) and bolts/screws (103) attaching carrier (100) to air distributor assembly (102).

Install or Connect

NOTICE: Refer to "Notice" on page 8C-1 of this section.

1. Instrument panel carrier (94 or 100).
 - If Chevrolet:
 - A. Align and engage four locator pins on carrier (94) to slots on hinge pillar tie bar (92).
 - B. Bolts/screws (95) attaching carrier (94) to hinge pillar tie bar (92).
 - C. Bolt/screw (95) through lower reinforcement bracket (98) to right-hand hinge pillar.

Tighten

- Bolts/screws (95) to 10 N.m (89 lb. in.).
- If Buick:
 - A. Align and engage carrier to locator pins on air distributor.
 - B. Bolts/screws (101) attaching upper area of carrier to air distributor (102).

Tighten

- Bolts/screws (101) to 10 N.m (89 lb. in.).
- C. Bolts/screws (103) to secure lower area of instrument panel carrier (100).

Tighten

- Bolts/screws (103) to 1.9 N.m (17 lb. in.).
2. Instrument panel lower brace (93).
 3. Nut (97) attaching lower brace (93) to cowl.

Tighten

- Nut (97) to 10 N.m (89 lb. in.).
4. Bolts/screws (96) attaching lower brace (93) to carrier.

Tighten

- Bolts/screws (96) to 10 N.m (89 lb. in.)
5. Instrument panel harness and antenna cable connectors at right hinge pillar.
 6. Temperature valve electric actuator and vacuum solenoid valve electrical connectors for Buick, or temperature control cable at module for Chevrolet.
 7. Fifty-six way, ten way and eight way instrument panel harness connectors located just right of the steering column.
 8. Raise steering column. Refer to SECTION 3F.
 9. Parking brake release handle. Refer to SECTION 5F.
 10. Inside air temperature sensor. Refer to SECTION 1C.
 11. Passenger inflator module. Refer to SECTION 9J.
 12. Instrument panel sound insulator panel. Refer to "Instrument Panel Sound Insulator Panel" in this section.
 13. Stoplamp switch. Refer to SECTION 5.
 14. Instrument panel driver knee bolster and deflector. Refer to "Instrument Panel Driver Knee Bolster and Deflector" in this section.
 15. Instrument panel upper trim pad. Refer to "Instrument Panel Upper Trim Pad" in this section.
 16. If Buick, instrument panel steering column opening filler. Refer to "Instrument Panel Steering Column Opening Filler" in this section.
 17. If Chevrolet, instrument panel lower trim plate. Refer to "Instrument Panel Lower Trim Plate" in this section.
 18. If Buick, instrument panel trim plate. Refer to "Instrument Panel Trim Plate" in this section.
 19. Instrument panel right-hand trim plate. Refer to "Instrument Panel Right-Hand Trim Plate" in this section.
 20. If Chevrolet, instrument panel cluster trim plate. Refer to "Instrument Panel Cluster Trim Plate" in this section.
 21. Windshield defroster nozzle grille. Refer to "Windshield Defroster Nozzle Grille" in this section.
 22. Enable SIR. Refer to "Enabling the SIR System" in this section.

Instrument Panel Wiring Harness

Refer to Figure 27 for Chevrolet and Figure 28 for Buick when referencing instrument panel wiring harness routing.

ACCESSORY WIRING HARNESS

(Police Vehicles)

Refer to Figure 29 for accessory wiring harness routing.

WINDSHIELD WIPER/WASHER SYSTEM

NOTICE: Refer to battery disconnect caution in Section 0A.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paint, grease, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

Figure 1

The windshield wiper/washer system consists of a permanent-magnet, depressed-park wiper motor assembly, a transmission assembly, wiper arm and blade assemblies, a washer pump mounted on a washer solvent container and a wiper/washer switch assembly (Figure 1).

The wiper/washer system is a pulse-type (delay). Pulse timing and demand wash functions are controlled electronically.

Figure 1 — Wiper/Washer Switch Assembly

SYSTEM OPERATION

Figure 2

Wiper Operation

In addition to the features of a standard (non-pulse) wiper system (mist, low and high speeds), the pulse-type windshield wiper/washer system includes an operating mode in which the wipers make single sweeps with an adjustable time interval between sweeps. The time interval is controlled by a solid-state timer in the wiper motor cover assembly. The duration of the delay interval is determined by the delay rheostat in the wiper/washer switch assembly.

The wiper motor is protected by a circuit breaker. If the wipers are blocked (by snow or ice, for example), the circuit breaker will open the circuit. The circuit breaker resets automatically when it cools.

8E-2 WINDSHIELD WIPER/WASHER SYSTEM

Pulse Operation

With the wiper switch in "DELAY" (pulse), battery voltage is applied to the wiper motor cover assembly at connector C1 terminal "F" through the PNK wire. Voltage also is applied to connector C1 terminal "B" through the GRY wire.

The variable resistance set by the pulse delay resistor of the wiper/washer switch assembly is used by the wiper motor cover circuitry to determine the delay time between sweeps.

Low-Speed Operation

In the "LO" position, the wiper switch applies battery voltage to the wiper motor cover assembly at connector C1 terminal "C" through the DK GRN wire and to connector C1 terminal "B" through the GRY wire.

Wiper motor cover circuitry supplies power from connector C1 terminal "A" through the YEL jumper wire to connector C2 terminal "B" to the wiper motor.

High-Speed Operation

In the "HI" position, the wiper switch applies battery voltage to the wiper motor cover assembly at connector C1 terminal "C" through the DK GRN wire and to connector C1 terminal "B" through the GRY wire.

The wiper motor cover assembly supplies power from connector C1 terminal "A" through the YEL jumper wire to connector C2 terminal "B" to the wiper motor. The wiper motor also has voltage applied from the wiper/washer switch assembly to connector C2 terminal "A" through the PPL wire to a separate armature brush for high-speed operation.

Park-Position Operation

When turned "OFF" from any position, the wipers complete the last sweep and park. When the wiper switch is in "OFF," the wiper motor cover assembly has battery voltage applied to connector C1 terminal "C" through the DK GRN wire and connector C1 terminal "F" through the PNK wire. The wiper motor cover circuitry controls power through the park relay to connector C1 terminal "A" through the YEL jumper wire to connector C2 terminal "B" to the wiper motor, which runs until the park relay is opened.

The park relay is controlled both electronically and mechanically. The relay is held closed mechanically until the wipers reach the park position and "wiper request" is no longer present. Whenever "wiper request" is present, the relay is held closed electronically.

Washer Operation

When the washer switch is pressed, the wipers operate at low speed using the same circuit operation as low speed, or the same as high speed only if "HI" speed is selected.

When the washer switch is held ON, the wiper motor assembly will keep the washer pump ON only as long as the washer switch is held ON. If the wipers had been in "DELAY," "LO" or "HI," they would return to that operation after the wash cycle. If not, they then return to park position after approximately three sweeps.

Mist Operation

When the wiper switch is moved to MIST and released, the wipers make one sweep at low speed and return to park position. The circuit operation is the same as that of low speed.

DIAGNOSIS

COMPONENT LOCATIONS

- Refer to Figure 4 for a list of component locations.

TROUBLESHOOTING HINTS

Figure 2

- Make the following checks before beginning System Diagnosis.
 1. Check fuse 10. If open, check CKT 143 for short to ground.
 2. If washer does not operate, check that:
 - Washer solvent container is filled.
 - Hoses are correctly attached.
 - Hoses are not cut, kinked or pinched.
 - Nozzles are not clogged.
 - Connector seal at washer pump is not damaged or missing.
 3. If washer does not operate and wipers run in "HI" only (low speed inoperative), check CKT 91 for open.
 4. Check for binding or broken wiper transmission assembly.
 5. Check for missing or damaged connector seal at wiper motor assembly.
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the Wiper/Washer System Check (Figure 5), then refer to the Symptom Table (Figure 6) for the appropriate diagnostic procedures.

Figure 2 — Windshield Wiper/Washer System Electrical Schematic

Figure 4 — Component Locations

WINDSHIELD WIPER/WASHER SYSTEM 8E-5

ACTION	NORMAL OPERATION
[1] • Turn ignition switch to "RUN." • Press washer switch ON.	Wipers operate at "LO" speed. Washer sprays windshield as long as washer switch is held in ON position. After releasing switch, washer stops and wipers return to park position after approximately 3 sweeps.
[2] • Turn wiper switch to "DELAY" (pulse mode).	Wipers make one complete sweep, then pause for 1 to 25 seconds before making the next sweep. The pause time is adjusted by turning the wiper switch through the delay range.
[3] • Wiper switch in "DELAY." • Press washer switch ON.	Washer sprays windshield as long as washer switch is held ON. Wipers run at low speed while spraying and continue until washer switch is released. Wipers then return to pulse operation.
[4] • Turn wiper switch to "LO."	Wipers run continuously at low speed.
[5] • Turn wiper switch to "HI."	Wipers run continuously at faster speed.
[6] • Turn wiper switch to "OFF."	Wipers return to park position at low speed.
[7] • Turn wiper switch to "MIST," then release.	Wipers make one complete sweep, then return to park position.

ON-VEHICLE SERVICE**WASHER PUMP REPLACEMENT****Figure 7****Remove or Disconnect**

1. Negative battery cable. Refer to SECTION 0A.
2. Washer solvent.
3. Electrical connector(s) and washer hose (4).
4. Washer solvent container (1) attaching parts.
5. Washer solvent container (1).
6. Windshield washer pump (3) from container.

Install or Connect

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

1. Windshield washer pump (3) in washer solvent container (1).

Important

- Make sure windshield washer pump is pushed all the way into the container seal.
2. Washer solvent container (1) and attaching parts.
 3. Electrical connector(s) and washer hose (4).
 4. Washer solvent.
 5. Negative battery cable. Refer to SECTION 0A.

WIPER ARM ASSEMBLY REPLACEMENT**Figures 8 through 12****Remove or Disconnect**

1. Wiper arm nozzle hose (6, Figure 8) from plastic hose assembly connector (7).
2. Protective cap (5).
3. Lift wiper arm assembly (9, Figure 9) and insert a suitable pin or pop rivet (B, pivot prevention pin) completely through the two holes located next to pivot of arm.
4. Nut (8, Figure 8).
5. Wiper arm assembly (9, Figure 9) from linkage drive shaft (A, Figure 9) using a battery terminal puller.

Clean

- Knurls of linkage drive shaft (C, Figure 10) with a suitable wire brush.
6. Wiper blade assembly, if required. Refer to "Wiper Blade Assembly Replacement."

**Figure 7 — Washer Pump(s) and Solvent Container (Typical)****Figure 8 — Wiper Arm Hose, Cap and Nut Removal (Typical)****Figure 9 — Pin or Pop Rivet Insertion (Typical)**

8E-12 WINDSHIELD WIPER/WASHER SYSTEM

Install or Connect

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

1. Wiper blade assembly, if removed. Refer to "Wiper Blade Assembly Replacement."
2. Pivot prevention pin (B, Figure 9), if removed.
3. Wiper arm assembly (9, Figure 9) on linkage drive shaft (A, Figure 9), with inboard surface of wiper arm assembly (9, Figure 11) 25mm (1 in.) below stop surface of park ramp (D, Figure 11).
4. Wiper arm nozzle hose (6, Figure 8) to plastic hose assembly connector (7, Figure 8).
5. Remove pivot prevention pin (B, Figure 9) from wiper arm assembly (9, Figure 9).
6. New nut (8, Figure 8).

Tighten

- Nut (8) to 23 N·m (17 lb. ft.).

7. Lift replaced wiper arm assembly (9, Figure 11) over park ramp (D, Figure 11).

Inspect

- Run wipers and check for correct wipe pattern. LH blade tip should wipe to a limit of 21.3-92.3 mm (0.75-3.50 in.) from outside edge of glass. RH blade should overlap into LH wipe pattern as shown in Figure 12.
- Shut off wipers and check for proper park position.

8. Protective cap (5, Figure 8).

Figure 10 — Wiper Arm Assembly Removal

Figure 11 — Wiper Arm and Blade Assembly Installation (Typical)

Figure 12 — Blade Wiper Pattern Check

WIPER BLADE ASSEMBLY REPLACEMENT

Figure 13

Remove or Disconnect

1. If wiper arm assembly (9) has not been removed, run wiper to mid-wipe position.
2. Lift blade release latch (H).
3. Wiper blade assembly (10) from wiper arm assembly (9).

Install or Connect

Important

- Use only 22-inch beam-type blade assemblies.

1. Wiper blade assembly (10).
2. Park wipers if at mid-wipe position.

WIPER BLADE ELEMENT REPLACEMENT

Figure 13

Important

- To prevent possible windshield damage, the blade assembly should be removed from the wiper arm assembly to replace the blade element.
- If a blade element is removed, it must be replaced.

Remove or Disconnect

1. Wiper blade assembly. Refer to "Wiper Blade Assembly Replacement."
2. Insert a small coin between edge of blade superstructure (J) and blade element (11) beside claw (K, View A). Press slowly until blade element clears one side of claw set (K).
3. Blade element from other claw sets (K).

Install or Connect

1. Blade element (11) into claws (K), starting with second set from outer end (View B).
2. Engage blade element (11) into one side of remaining claw set (K) and, with a rocking motion, push blade element (11) upward until it snaps into place (View C).
3. Wiper blade assembly. Refer to "Wiper Blade Assembly Replacement."

PLASTIC HOSE ASSEMBLY REPLACEMENT

Figures 13 and 14

Remove or Disconnect

1. RH wiper arm nozzle hose (6, Figure 13) from plastic hose assembly (7, Figure 14).
2. LH wiper arm and blade assembly. Refer to "Wiper Arm Assembly Replacement."
3. LH cowl vent screen (M).
4. Washer hose (4) from plastic hose assembly (7).
5. Plastic hose assembly (7) from LH cowl vent screen (M).

Install or Connect

1. Plastic hose assembly (7) into the two clips of LH cowl vent screen (M).

Important

- Be sure that LH connector of plastic hose assembly is inserted through cutout in screen near left clip so that wiper arm nozzle hose end, when connected, will be on top of screen. Also, the two flanges on the plastic hose assembly must engage cutout in LH screen.
2. Washer hose (4) to plastic hose assembly (7).
 3. LH cowl vent screen (M).
 4. LH wiper arm and blade assembly. Refer to "Wiper Arm Assembly Replacement."
 5. RH wiper arm nozzle hose (6, Figure 13) to plastic hose assembly (7, Figure 14).

WINDSHIELD WASHER

Figures 12 and 13

A correctly operating windshield wiper/washer system has a spray pattern that cleans 75% of the wipe pattern (Figure 12) within ten wiper cycles. If a wiper arm washer nozzle (12, Figure 13) becomes plugged, apply air pressure. If nozzle remains plugged, the nozzle must be replaced.

↔ Remove or Disconnect

Tool Required:

J 39232 Wiper Linkage Separator

1. Negative battery cable. Refer to SECTION 0A.
2. RH wiper arm and blade assembly. Refer to "Wiper Arm Assembly Replacement."

! Important

- To prevent possible windshield damage, the LH cowl vent screen must be removed before the RH cowl vent screen is removed.
3. LH and RH cowl vent screens (M and N, Figure 14).

4. Two screws (13, Figure 15) and linkage access hole cover (14, Figure 15).
5. Disengage linkage drive link (P, Figure 15) from wiper motor crank arm (Q, Figure 15) using J 39232 (Figure 16).
6. Electrical connectors from wiper motor assembly (15, Figure 15).
7. Three screws (16, Figure 15) and wiper motor assembly (15, Figure 15) from vehicle.

→ Install or Connect

Tool Required:

J 39529 Wiper Linkage Installer

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

1. Wiper motor assembly (15, Figure 15) on vehicle with three screws (16, Figure 15).

8E-16 WINDSHIELD WIPER/WASHER SYSTEM

Figure 15 — Wiper Motor and Linkage Assemblies

Tighten

- Screws (16) to 9 N·m (80 lb. in.).
- 2. Electrical connectors to wiper motor assembly (15, Figure 15).
- 3. Linkage drive link (P, Figure 15) to wiper motor crank arm (Q, Figure 15) using J 39529 (Figure 17).
- 4. Linkage access hole cover (14, figure 15) on vehicle with two screws (13, Figure 15).

Tighten

- Screws (13) to 2 N·m (18 lb. in.).

Important

- To prevent possible windshield damage, the RH cowl vent screen must be installed before the LH cowl vent screen is installed.
- 5. RH and LH cowl vent screens (N and M, Figure 14).
- 6. RH wiper arm and blade assembly. Refer to "Wiper Arm Assembly Replacement."
- 7. Negative battery cable. Refer to SECTION 0A.

WIPER MOTOR COVER ASSEMBLY REPLACEMENT

Figure 18

Remove or Disconnect

1. Negative battery cable. Refer to SECTION 0A.
2. Electrical connectors from wiper motor assembly (15).
3. Three screws (17) and wiper motor cover assembly (18) from wiper motor assembly (15).

Install or Connect

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

Important

- Always install cover assembly with wiper motor in park position and drive pin in the open area of the cam.
1. Wiper motor cover assembly (18) on wiper motor assembly (15) with three screws (17).

Tighten

- Screws (17) to 2 N•m (18 lb. in.).
2. Electrical connectors to wiper motor assembly (15).
 3. Negative battery cable. Refer to SECTION 0A.

WIPER LINKAGE ASSEMBLY REPLACEMENT

Figures 14, 15, 16 and 17

Remove or Disconnect

Tool Required:

J 39232 Wiper Linkage Separator

1. Negative battery cable. Refer to SECTION 0A.
2. Wiper arm and blade assemblies. Refer to "Wiper Arm Assembly Replacement."

Important

- To prevent possible windshield damage, the LH cowl vent screen must be removed before the RH cowl vent screen is removed.
3. LH and RH cowl vent screens (M and N, Figure 14).
 4. Washer hose (4, Figure 14) from plastic hose assembly (7, Figure 14).

Figure 16 — J 39232 Wiper Linkage Separator (Typical Usage)

Figure 17 — J 39529 Wiper Linkage Installer (Typical Usage)

5. Two screws (13, Figure 15) and linkage access hole cover (14, Figure 15).
6. Disengage linkage drive link (P, Figure 15) from wiper motor crank arm (Q, Figure 15) using J 39232 (Figure 16).
7. Six screws (19, Figure 15).
8. Wiper linkage assembly (20, Figure 15) by guiding it through access hole in dash panel.

Install or Connect

Tool Required:

J 39529 Wiper Linkage Installer

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

1. Insert left side of wiper linkage assembly (20, Figure 15) through access hole in right side of dash panel drain trough. Then, position RH linkage spindle through access hole in dash panel extension and align with dash panel mounting holes. Hand tighten one screw (19, Figure 15) through hole marked "X" in Figure 15.

8E-18 WINDSHIELD WIPER/WASHER SYSTEM

2. Position LH linkage spindle through access hole in dash panel extension and align with dash panel mounting holes.
3. Three screws (19, Figure 15) in LH spindle.
4. Two remaining screws (19) in RH spindle.

Tighten

- Six screws (19) to 8 N•m (71 lb. in.).
5. Linkage drive link (P, Figure 15) to wiper motor crank arm (Q) using J 39529.
 6. Linkage access hole cover (14, Figure 15) on vehicle with two screws (13).

Tighten

- Screws (13) to 2 N•m (18 lb. in.).
7. Washer hose (4, Figure 14) to plastic hose assembly (7).

Important

- To prevent possible windshield damage, the RH cowl vent screen must be installed before the LH cowl vent screen is installed.
8. RH and LH cowl vent screens (N and M).
 9. Wiper arm and blade assemblies. Refer to "Wiper Arm Assembly Replacement."

Figure 18 — Wiper Motor Cover Assembly Replacement

WIPER/WASHER SWITCH ASSEMBLY REPLACEMENT

The wiper/washer switch assembly is a non-replaceable component of the multifunction turn signal lever. For lever replacement, refer to "Steering Wheel and Column On-Vehicle Service (SEC. 3F)."

OFF-VEHICLE SERVICE

PARK SWITCH ASSEMBLY REPLACEMENT

Figures 18 and 19

Remove or Disconnect

1. Wiper motor assembly. Refer to "Wiper Motor Assembly Replacement."

Figure 19 — Wiper Motor Assembly Components

2. Wiper motor cover assembly. Refer to "Wiper Motor Cover Assembly Replacement."

Important

- If wiper motor (15) is in park position (Figure 18), operate wiper motor as required to remove pawl from relay slot.
3. Screw (21, Figure 19) and park switch assembly (22, Figure 19).

Install or Connect

NOTICE: Refer to fastener "Notice" on page 8E-1 of this section.

1. New park switch assembly (22) with screw (21).
2. Operate wiper motor (15, Figure 18) back into park position (pawl in relay slot).
3. Cover assembly (18). Follow "Wiper Motor Cover Assembly Replacement" procedure carefully.
4. Wiper motor assembly. Refer to "Wiper Motor Assembly Replacement."

WIPER CHATTER REPAIR

Some vehicles may exhibit a condition where the windshield wipers chatter and/or wipe unevenly. Several items may contribute to this condition. To completely repair this condition, ALL items listed should be checked and repaired as necessary.

WINDSHIELD GLASS CLEANING

Clean windshield with windshield cleaner, GM PN 1050011 or equivalent. The cleaner used should be one which will not harm paint finish or scratch glass. The glass is clean when water no longer beads, but sheets across entire glass surface.

WIPER BLADE ELEMENT CLEANING

Lift each wiper blade assembly off windshield and clean element with a cloth saturated in full strength washer solvent. Rinse blade assemblies with water.

CAUTION: Avoid prolonged skin contact with washer solvent.

WIPER ARM PRESSURE CHECK

Figure 20

1. Run wipers to mid-wipe position.
2. Remove wiper blade assemblies. Refer to "Wiper Blade Assembly Replacement."
3. Attach a scale (V) to blade attaching pin (W) and measure the force required to lift wiper arm perpendicular to windshield to normal working height (height with blade assembly attached).

4. If the force required is not within the specifications given below, the wiper arm assembly should be replaced.

Tip Pressure — Newtons - 8.3 to 10.1
(Ounces) - (30 to 36)

Figure 20 — Wiper Arm Pressure Check

Figure 21 — Blade Assembly Mounting Angle Check

8E-20 WINDSHIELD WIPER/WASHER SYSTEM

BLADE ASSEMBLY MOUNTING ANGLE CHECK

Figure 21

With the wiper arm and blade assemblies in the middle of a wipe stroke, remove the wiper blade assemblies. Visually check that the blade attaching pin (W) on each wiper arm is parallel to the windshield. Replace the wiper arm assembly if necessary.

BLADE ELEMENT SET CHECK

Figure 22

Remove the wiper blade assemblies from the wiper arm assemblies, being careful to note orientation for reassembly. Look down the length of the blade element. The rubber element which contacts the glass must be on the center line of the blade assembly ± 15 degrees. Replace the element if necessary.

NOTICE: Refer to battery disconnect caution in Section 0A.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paint, grease, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

The rear window wiper/washer system uses a single-speed, permanent-magnet wiper motor assembly (Figure 1) attached to the rear header. A wet wiper arm assembly is attached to the wiper motor assembly and operation is controlled by a dash-mounted wiper/washer switch which is part of the accessory switch. The washer pump is mounted in the outboard cavity of the washer solvent container in the engine compartment.

A plug-in autopark module is a serviceable part of the wiper motor assembly. The module supplies power to the wiper motor to allow the wiper to move to park position if the ignition is turned off while the wiper is operating.

Figure 1 — Rear Window Wiper Motor Assembly

SYSTEM OPERATION

Figure 2

Battery voltage is applied at all times from fuse #36 and CKT 840 to terminal "A" of the wiper motor assembly. With the ignition switch in ACCY or RUN, battery voltage also is applied from fuse #8 and CKT 243 to terminal "B" (Buick) or "F" (Chev) of the wiper/washer switch.

Wiper Operation

When the wiper switch is set to ON, battery voltage is applied to terminal "B" of the liftgate wiper latch switch from CKT 1543. When the rear glass is closed, voltage is applied to terminal "C" of the wiper motor assembly from the liftgate wiper latch switch

and CKT 391. This voltage is used by the wiper motor assembly as a "wiper request," a signal to start wiper motor operation. The power to operate the wiper motor is supplied to the assembly at terminal "A." The ground is connected to terminal "B" from CKT 750. When the wiper motor loses the "wiper request" signal, it will de-energize its internal relay when it detects the wiper to be in park position.

Washer Operation

When the wiper/washer switch is held in the WASH position, it applies battery voltage to terminal "A" of the washer pump from CKT 392, causing the washer pump to start spraying until the wiper/washer switch is released from the WASH position.

8E1-2 REAR WINDOW WIPER/WASHER SYSTEM

Figure 2 — Rear Window Wiper/Washer System Electrical Schematic

DIAGNOSIS

COMPONENT LOCATIONS

- Refer to Figure 3 for a list of component locations.

TROUBLESHOOTING HINTS

- Make the following checks before beginning System Diagnosis.
- 1. If washer does not operate, check that:
 - Washer solvent container is filled.
 - Hoses are correctly attached.
 - Hoses are not cut, kinked or pinched.
 - Nozzle is not clogged.

- Connector seal at washer pump is not damaged or missing.
- Fuse #8 is not open.
- G200 is clean and tight.

- If wipers do not operate, check that:

- Fuse #36 is not open.
- G400 is clean and tight.

- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the Wiper/Washer System Check (Figure 4) as a guide to normal operation, then refer to the Symptom Table (Figure 5) for the appropriate diagnostic procedures.

COMPONENT	LOCATION
Rear Window Wiper and Washer and Multi-Function Switch (Buick)	Left side of I/P
Accessory Switch Panel (Chev)	Left side of I/P
I/P Fuse Block	Mounted to LH I/P, accessible with LH front door open
Endgate Window Switch	Near center of tailgate
Rear Window Wiper Motor	Attached to rear header
Rear Window Washer Motor	Attached to washer fluid reservoir, in engine compartment
C200 (56 cavities)	Body harness to I/P harness, bolted above accelerator pedal
C351 (6 cavities)	Body harness to rear header harness, near center of LH "D" pillar
C405 (6 cavities)	Body harness to tailgate harness, center of LH "D" pillar
C406	Body harness to tailgate harness, center of LH "D" pillar
G200	Base of LH "A" pillar, behind LH kickpad
G400	Near center of RH "D" pillar
P102	Visible from engine compartment, behind LH wheelhouse
P403	Between tailgate and LH "D" pillar
S281	Body harness, in convenience center, branch, approx. 24 cm from point of breakout
S406	Rear header harness, approx. 17 cm from RH rear window defogger ground breakout

Figure 3 — Component Locations

ACTION	NORMAL OPERATION
- Ignition switch in ACCY or RUN. - Wiper/washer switch to ON.	Wiper runs continuously.
[2] Wiper/washer switch to WASH.	Washer sprays rear window as long as switch is held on WASH. Wiper runs continuously while washer is on.
[3] Wiper/washer switch to OFF.	Wiper completes last stroke and returns to park position.

GENERAL DESCRIPTION

All radios have electronic memory for preselected station function.

SPEAKER SYSTEM

There are two front speakers, one in each front side door; and two rear speakers mounted in the rear window panel trim on sedans, and under the body lock pillar trim finish panel on wagons. These speaker locations allow for a full, high fidelity sound.

Standard radio front side door speakers are 4 x 6 inches and 10 ohms. Radio rear speakers are 6 x 9 inches and 10 ohms.

High performance extended range speakers are standard with full ETR® (electronically tuned receiver) systems. All radios on these vehicles have this system.

RADIO FIXED ANTENNA

The fixed antenna is designed to provide good radio omni-directional reception in moderate fringe areas.

9A-2 AUDIO SYSTEMS

RADIO POWER ANTENNA

When the ignition switch is either in the "RUN" or "ACCESSORY" position and the radio is turned on, the antenna will fully extend. The fully extended height is approximately 80 cm (31.5 inches).

When the radio is turned off, the antenna will fully retract completely below the front fender or rear quarter outer panel surfaces.

The three-section mast antenna on Buick sedans, and four-section mast antenna on wagons and Chevrolet sedans are attached to a plastic cable driven up and down by an electric motor. This motor is automatically shut off when the mast is fully extended or retracted. The switching is accomplished by the thrust reaction of the motor armature and worm gear against the drive gear. The thrust reaction trips the reaction switch, interrupting power flow to the motor.

RADIOS

Figures 1 through 6

All 2000-series radios feature ETR tuning, vacuum fluorescent display, AM-FM stereo, seek and scan tuning, and digital clock display. Seven radios are available: three of them are available in Buick, and four of them are available in Chevrolet.

- AM-FM Stereo (UM7).
- AM-FM Stereo Cassette (UM6) with dynamic noise reduction (DNR).
- AM-FM Stereo Cassette (UN6) (Buick).
- AM-FM Stereo Cassette (UL0) (Buick).
- AM-FM Stereo Cassette (UL0) (Chevrolet).
- AM-FM Stereo Compact Disc (UN0) (Chevrolet).
- AM-FM Stereo Compact Disc/Cassette (UP0) (Buick).

Figure 5 - UL0 Radio - (Chevrolet)

Figure 6 - UN0 Radio - (Chevrolet)

All radios use four speakers: two speakers mounted in the front side doors and two in the rear window panel trim on sedans, and in the body lock pillar trim finish panel on wagons.

FM Stereo

All factory-equipped sound systems with an FM stereo radio will switch to stereo operation whenever an FM stereo broadcast is being received, an indicator in the dial will light. Stereo operation means the radio is separating a stereo broadcast back into the original two channels, called "left" and "right". Stereo sound is noticeably more realistic to the ear. Although FM is normally static-free, reception can be limited by terrain, atmospheric conditions, station strength and distance from the transmitter. Buildings or other obstructions can cause momentary static, flutter or station swapping. If reception is poor, tuning to a stronger station will bring improvement.

AMAX Stereo Certification

All optional radios are AMAX certified. These receivers can reproduce the fidelity sound now transmitted by all AM stations but not received on all AM radios.

Some improvements are high fidelity, adjustable receiver band width (wide for high fidelity or narrow to cut out any interference), noise cancellation, full stereo sound, new frequencies received and external antenna capability.

The range of most AM stations is greater than FM, especially at night. The longer range, however, can cause stations to interfere with each other. AM is also subject to noise pick-up from storms, power lines, etc. AMAX certification reduces many of these problems.

RADIO CONTROLS

When the radio is first turned on, the frequency will appear on the display for five seconds, and then the display will return to the time display. To recall the frequency, simply push in the upper knob or the "RCL" button while the radio is turned on. The frequency will appear on the display for five seconds. To display the time when the ignition lock cylinder is in the "LOCK" or "OFF" position, simply push the upper knob or "RCL" button. The time will display for five seconds. Then the display will turn blank.

ETR® AM-FM STEREO (UM7)

Radio Operation

CHEVROLET

Figure 1

UPPER KNOB

This knob turns the radio on and off. Turn the knob clockwise to increase volume and counter-clockwise to decrease volume. The control ring behind the knob is the balance control. Turn the ring clockwise to move speaker balance to the right and counter-clockwise to move speaker balance to the left.

LOWER KNOB

Turn the knob to manually select radio stations. Press the knob to choose either the AM or the FM band. The control ring behind the lower knob fades the sound between the front and rear speakers.

BASS AND TREBLE CONTROLS

Slide the treble control up to increase treble and down to decrease treble. Slide the bass control up to increase bass and down to decrease bass.

PUSH BUTTONS

To preset four AM stations and four FM stations:

1. Turn in desired station.
2. Press "Set". Within five seconds, press a station button.
3. Repeat these steps for each push button.

To preset three additional AM stations and three additional FM stations:

1. Tune in desired station.
2. Press "SET". Within five seconds, press any two adjacent buttons.

The radio will tune to the preselected station when the button is pushed. Button pairing allows for seven AM and seven FM stations to be preset for a total fourteen preset stations.

If electrical power is interrupted by a blown fuse or a discharged battery, all stations must be set.

CLOCK

To set the clock display the ignition may be on or off. To set the clock:

1. Push "SET".
2. Within five seconds, push and hold "SCAN" until the correct hour appears.
3. Then press and hold "SEEK" until correct minute appears.

SEEK AND SCAN FEATURE

The UM7 radio has "SEEK" and "SCAN" features for electronic station tuning up and down the band.

Press "SEEK" or "SCAN" and the radio will tune to the next higher or lower station with enough signal strength to be heard clearly, and stay there.

Figure 2

UPPER KNOB

This knob turns the radio on and off. Turn the knob clockwise to increase volume and counter-clockwise to decrease volume. The control ring behind the knob is the balance control. Turn the

9A-4 AUDIO SYSTEMS

ring clockwise to move speaker balance to the right and counter-clockwise to move speaker balance to the left. Press the knob to select the other side of the tape when playing a cassette.

LOWER KNOB

Turn the knob to manually select radio stations. When the radio is on and the tape player is off, press the knob to choose either the AM or the FM band.

The control ring behind the lower knob fades the sound between the front and rear speakers.

BASS AND TREBLE CONTROL

Slide the treble control up to increase treble and down to decrease treble. Slide the bass control up to increase bass and down to decrease bass.

PUSH BUTTONS

To preset four AM stations and four FM stations:

1. Turn in desired station.
2. Press "SET". Within five seconds, press a station button.
3. Repeat these steps for each push button.

To preset three additional AM stations and three additional FM stations:

1. Tune in desired station.
2. Press "SET". Within five seconds, press any two adjacent buttons.

The radio will tune to the preselected station when the button is pressed. Button pairing allows for seven AM and seven FM stations to be preset for a total fourteen preset stations.

If electrical power is interrupted by a blown fuse or a discharged battery, all stations must be reset.

CLOCK

To set the clock display on a UM6 radio, the ignition may be on or off. To set the clock:

1. Push "SET".
2. Within five seconds, push and hold "SCAN" until correct hour appears.
3. Then press and hold "SEEK" until correct minute appears.

SEEK AND SCAN FEATURE

The UM6 radios have "SEEK" and "SCAN" features for electronic station tuning up and down the band.

Press "SEEK" or "SCAN" and the radio will tune to the next higher or lower station with enough signal strength to be heard clearly, and stay there.

Cassette Tape Player

To play a tape, the ignition lock cylinder must be in the "ACCESSORY" or "RUN" position, and the receiver/tape player must be turned on. Insert the cassette squarely through the door, exposed tape side of the cassette first. When the tape is fully inserted, the radio will turn off and the tape will begin playing.

To advance the tape, press the (forward) button. To reverse the tape, press the (reverse) button. To resume tape play from fast forward or reverse, press the "STOP-EJECT" button lightly. When the tape reaches the end of a side, it will automatically reverse and play the other side of the tape. To resume listening to the radio or to eject the tape, push the "STOP-EJECT" button.
